In 1868, he convoked an Ecumenical Council to meet at Rome on Dec. 8, 1869, for the purpose of defining the infallibility of the pope as regards 'what-ever belongs to faith and morals, or the primacy and teaching authority of Peter,' and the relations of the church to the state governments. On July 18, 1870, the council pronounced in favour of the dogma of infallibility by a vote of 533 to 2. The opposing prelates were Mgr. Riccio, Bishop of Cajazzo, in Italy, and Mgr. Fitzgerald, Bishop of Little Rock, in the U. States; but they formally withdrew their negative immediately upon the pronouncement of the dogma by the Pope. The only noted theologian who opposed the decree after its official promulgation was Dr. Döllinger of Munich, who was excommunicated April 17, 1871. On August 7, 1873, his Holiness addressed a letter to the Emperor of Germany complaining in very strong terms of the harsh measures which had been adopted against the church in Prussia. This letter with the emperor's reply was published at Berlin Oct. 14 of the same year, and in 1875 was followed by a condemnation by the pope of the German laws, as being wholly null and void. P. died at Rome Feb. 7, 1878.

PIZARRO, FRANCISCO, the conqueror of Peru, was an illegitimate son of Gonzalo Pizarro, a colonel of infantry, and a soldier of some distinction. He was born at Truxillo, in Estremadura, Spain, about 1471. Of his youth, little is known, but it appears that he was wholly neglected by his parents, was taught neither to read nor write, and that in his youth his principal occupation was that of a swineherd. Abandoning this uncongenial employment, he sought the port of Seville, and there embarked, to seek fortune in the New World. He was in Hispaniola in 1510; later, he joined Balboa, and was with that cavalier when he crossed the Isthmus of Panama, and discovered the Pacific. In 1515, he was engaged in traffic with the natives on the shores of the newly-discovered ocean, but was afterwards chiefly employed in military service, in which he shewed great bravery, resource, and power of endurance. About this time, when a fresh and powerful impulse was given to adventure by the splendid achievement of Cortes, rumours of a country far south, in which gold and silver were said to be as abundant as iron in Spain, reached Panama, and kindled P.'s ambition. He formed a sort of copartnery with Diego de Almagro, an adventurer and a foundling like himself, and Hernando Luque, an ecclesiastic; and with the funds which the three friends amassed, they were enabled to fit out a small expedition, of which P. took command. In November 1524, he set sail southward, but went no further than Quemada Point. Making an agreement (dated March 10, 1526), that all lands, treasures, vassals, &c., that should be discovered, were to be equally divided between them, the three friends, P., Almagro, and Luque, organised a second expedition, consisting of two ships, which set sail for the South Seas. Having reached the port of Santa, in lat. about 9° S., and having really discovered Peru, P. returned to Panama, carrying with him, however, many beautiful and valuable ornaments in gold and silver, which he had obtained from the friendly and generous natives, as well as specimens of woollen cloths of silky texture and brilliant hue, and some llamas or alpacas. Unable to find in Panama a sufficient number of volunteers for the invasion of the newly-discovered country, the indomitable adventurer returned to Spain in 1528, narrated the story of his discoveries

before Charles V. and his ministers, described the wealth of the territories, and shewed, as proof, the gold ornaments and utensils, the manufactures, &c., which he had brought with him. The result of his representations was, that the right of the discovery and conquest of Peru was secured to him, and honourable titles—among others, those of Governor and Captain-general of Peru—were conferred on him. On his side, he agreed to raise a certain number of followers, and to send to the crown of Spain a fifth of all the treasures he should obtain. Returning to Panama, he set sail for Peru for the third and last time, with a well-equipped but small force, the number being not more than 180 men, of whom 27 were cavalry. The chief events of the conquest of Peru are detailed at sufficient length in the article PERU, and also the articles ALMAGRO and ATAHUALPA. Within ten years, the great conquistador made the empire of Peru his own; but he who had surmounted so many stupendous difficulties, who had broken through the lofty barrier of the Andes, and, with his group of followers, been a victor in so many fields, fell a victim to a conspiracy, June 26, 1541.

P. was a soldier of the most undoubted courage, inflexible constancy of purpose, and infinite resource; yet his success in Peru appears to have been more the result of chance than of calculation. His boldest stroke was the seizure of the Inca Atahualpa (q. v.), when surrounded by thousands of his followers; but in doing so, he deserved credit neither for originality nor policy, because the idea was borrowed from Cortes, and the step itself was so foolhardy and desperate, that its success can be regarded only as luck. Although on many occasions he appears to have been guided by noble and generous impulses, he was eminently selfish, perfidious, and relentless. His conquest of Peru is a drama in every act of which there is bloodshed; but the drama is at least consistent to the end. P. lived a life of violence, and died a violent and bloody death.

PIZARRO, GONZALO, threw in his fortunes with those of his brother Francisco, on the occasion when that leader returned to Spain in 1528. He was, like the great conqueror, illegitimate. He became a soldier at an early age, distinguished himself, before he joined his brother's expedition, by his skill in martial exercises, and when he reached Peru, was esteemed the best lance in the Spanish troop. The territory of Quito was assigned to him by Francisco, and he was enjoined to undertake an exploring expedition to the east, where a land, reputed to be extremely rich in spices, was said to lie. At the head of 350 Spaniards and a great concourse of Indians, P. set out on his famous journey in the beginning of 1540. Marching east, they reached a country traversed by lofty branches of the Andes. Here the icy winds benumbed the limbs of the adventurers as they rose to the higher plateaux, and, rendered helpless by the cold, many of them sank and died. Descending the eastern slopes of the Andes, they reached the 'Land of Cinnamon;' but as they could not transport the trees across the mountains, their discovery was almost valueless. Hearing of a land abounding in gold at the distance of ten days' journey, the leader resolved to reach it. Pushing forward, the Spaniards entered great forests, where often they had to hew a passage with their axes. Their clothes were now torn to shreds, and their provisions had been long exhausted. They killed and ate the dogs they had brought with them, after which they lived on the herbs and dangerous roots of the forest. At length they struck the broad but desolate waters of the Napo, an important affluent of the Amazon. On the surface of this broad river,

no vessel floated, and it ran amid gloomy woods, the silence of which was undisturbed save by the sound of the rushing waters. Here P. caused a rude bark to be constructed for the transport of the baggage and of the weaker travellers. Francisco de Orellana was intrusted with the command of the vessel. P., hearing of a populous nation at the distance of a few days' journey, who dwelt near the confluence of the Napo with a large river, sent forward Orellana to obtain and bring back supplies for the starving travellers, who had eaten the last of their horses, and were now reduced to the leather of their saddles and belts. Orellana reached the Amazon; but, unable either to obtain supplies, or to return against the current of the river, abandoned the expedition, and with his fifty followers resolved to sail down the Amazon, reach the Atlantic, and make for Spain. This wonderful design was successfully carried out. P., after waiting in vain for the return of the barque, resolved to return to Quito, which, after enduring terrible sufferings, and seeking fruitlessly for the rich regions of which he had heard so much, he reached in June 1542, after an absence of more than two years. The fatal character of this expedition may be inferred from the appearance the travellers presented on their return. Half of the 4000 Indians had perished, and of the Spaniards, only eighty remained; and these, clad in skins, blackened by the sun, and wasted by hunger and fatigue, with long matted locks, seemed like a troop of spectral savages. This expedition stands unmatched in the annals of American discovery for its dangers and sufferings, for the length of their duration, and for the heroic fortitude with which they were endured. For the fate of Gonzalo P., see article PERU.

PIZZICATO (Ital. twitched), abbreviated *pizz.*, a phrase used in Music for the violin or violoncello, to denote that the strings, instead of being played as usual by the bow, are to be twitched with the fingers in the manner of a harp or guitar. The pizzicato is much used in accompaniments, as sounds thus produced do not cover the voice; it is also used in symphonic effects. The ordinary mode of playing is restored by the letters *c. a.* (*col arco*, with the bow).

PLACENTA, or **AFTER-BIRTH**, a temporary organ that is developed within the uterus during pregnancy, and is, as its popular name implies, expelled from the maternal organism shortly after the birth of the child or young animal. It is a spongy vascular mass, existing in some form or other in all mammals, excepting the *Marsupialia* and *Monotremata*, as an appendage to the foetal membrane called the *chorion*. In the human subject (fig. 1), it is of considerable size at the period of delivery, being of a rounded or oval form, with a diameter of 6 or 8 inches, and a thickness of somewhat more than an inch. Its outer surface, which, till the period of its detachment and expulsion, is attached to the walls of the uterus, is uniform and level (unless it has been morbidly adherent), being covered by a membrane, shortly to be noticed, called the *decidua serotina*; and on peeling off this membrane, the various lobes of which the placenta is composed are apparent. The internal or free surface is smooth and shining, and gives attachment to the umbilical cord or navel-string, which connects it with the fœtus. To render the mode of formation of the placenta clear, we must premise that the impregnated ovum, when it reaches the uterus, is invested with an outer membrane, the *chorion*, which forms a shut sac, externally covered with short villi. As the ovum advances in age, these villi diminish in number, until few remain,

except at that part of the chorion which is in contact with the uterus; and here, about the second month (in the human subject), they divide into branches, as shewn in fig. 2. While these changes are going on in the membrane of the ovum, the uterus is also undergoing modification; and it is on the nature and extent of these uterine changes that the character or type of the placenta depends.

Fig. 1.—Human Placenta (half of it being split in two) and Umbilical Cord.

There are two such types, the first of which is best represented by the human placenta, and the latter by that of the pig.

In animals exhibiting the first type of placental structure, the mucous membrane lining the uterus

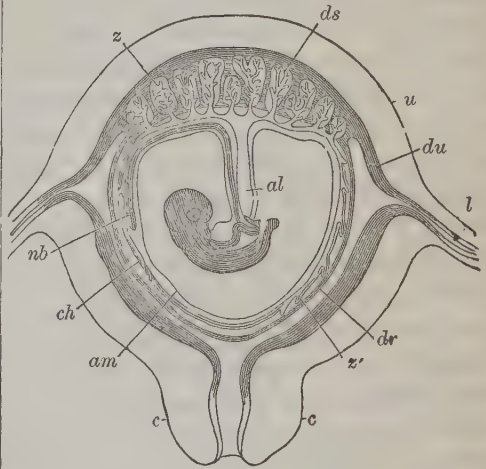

Fig. 2.—Diagrammatic Section of a Human Pregnant Uterus, with the contained Ovum:

u, uterus; *l*, oviduct (or Fallopian tube); *c*, cervix uteri (or neck of the womb); *du*, decidua uteri; *dr*, decidua reflexa; *ds*, decidua serotina; *ch*, chorion; *am*, amnion; *al*, allantois; *nb*, umbilical vesicle; *z*, villi, which form the foetal part of the placenta; *z'*, villi over the rest of the chorion, which, in the human subject, take no part in the placental function.

undergoes a rapid growth and modification of texture, becoming connected with the *membrana decidua*, which is so called from its being thrown off at each parturition. For brevity, it is usually termed the *decidua*. This decidua is from an early period separable into three portions—the *decidua*

vera, or *decidua uteri*, which lines the general cavity of the uterus; the *decidua reflexa*, which immediately invests the ovum; and the *decidua serotina*, which is merely a special development of a part of the *decidua vera* at the part where the villi of the chorion are becoming converted into the foetal portion of the placenta. The arrangement of these layers is distinctly seen in fig. 2. At first, the villi of the chorion lie loosely in the corresponding depressions of the *decidua*; but subsequently, the foetal and maternal structures (the villi and the *decidua vera*) become closely united, so as to form one inseparable mass, by the following means: the deeper substance of the uterine mucous membrane in the region of the placenta is traversed by vessels which enlarge into what, in the case of the veins, are termed *sinuses*, dip down between the villi, 'and at last swell round and between them, so that finally the villi are completely bound up or covered by the membrane which constitutes the walls of the vessels, this membrane following the contour of all the villi, and even passing, to a certain extent, over the branches and stems of the tufts.'—Goodsir's *Anatomical and Pathological Observations*, p. 60.

The pure maternal blood is conveyed to the placenta by what are termed, from their tortuous course, 'the curling arteries' of the uterus, and is returned by the large veins termed sinuses. 'The foetal vessels,' says Dr Carpenter, 'being bathed in this blood, as the branchiæ of aquatic animals are in the water that surrounds them, not only enable the foetal blood to exchange its venous character for the arterial, by parting with its carbonic acid to the maternal blood, and receiving oxygen from it, but they also serve as rootlets, by which certain nutritious elements of the maternal blood (probably those composing the liquor sanguinis) are taken into the system of the foetus. It is probable, too, that the placenta is to be regarded as an excretory organ, serving for the removal, through the maternal blood, of excrementitious matter, whose continued circulation through the blood of the foetus would be prejudicial to the latter.'—*Human Physiology*, 3d ed. pp. 1013, 1014. Moreover, the recent investigations of Bernard shew that the placenta secretes, like the liver, the saccharine matter known as Glycogen (q. v.), which probably takes part in keeping up the animal heat. The vascular connection between the foetus and the placenta is effected by the umbilical vein (containing arterial blood) and the two umbilical arteries (containing venous blood), all of which lie in the umbilical cord which connects the Foetus (q. v.) with the placenta. The placenta may be formed at any point of the uterus, but is most commonly on the left side. Occasionally (in 11 cases out of 600, according to Naegele), it is situated partially or entirely over the mouth of the womb (*os uteri*), in which case dangerous flooding takes place previous to or at the period of labour. This condition is known as *placenta previa*, and under ordinary management, 'one in three of the mothers are lost, and more than 65 per cent. of the children.'—Churchill, *Theory and Practice of Midwifery*, 3d ed. p. 473. By substituting the detachment and extraction of the placenta for the old method of turning the child *in utero*, Professor Simpson finds that the mortality sinks to one in fourteen of the mothers, but slightly rises (to 69 per cent.) in the case of the children.

Another difficulty in midwifery practice, but far less serious than the preceding, is undue retention of the placenta. In ordinary cases, the average interval between the birth of the child and the expulsion of the after-birth is a quarter of an hour. When the expulsion does not take place within an hour or an hour and a half, the case is regarded as

coming under the head of 'retained placenta.' It occurs in about 1 case in 400, and in these cases is fatal to about one mother in five; the cause of death being hæmorrhage. The principal causes of retention are either imperfect and insufficient, or irregular contraction of the womb, after the birth of the child. In the first of these cases, if the uterus cannot be excited to sufficient action, the placenta must be withdrawn by steady traction of the umbilical cord, and if it fail, extraction by the introduction of the hand (an operation always to be avoided if possible) must be resorted to; in the latter case, manual extraction is commonly necessary. Sometimes, in consequence of inflammatory or other affections of the placenta, there may be adhesion between its outer surface and the inner surface of the womb. This is the most dangerous form of retention, there being usually excessive flooding, and additionally the peril arising from the decomposition of any portion that cannot be removed without undue violence.

The placenta acquires its proper character, in the human subject, during the third month, and it subsequently goes on increasing to the full period of gestation. At about the fourth month, the blood, moving through the enlarged uterine vessels, produces a peculiar murmur, which is known as the *placental bruit*, resembling the sound made by blowing gently over the lip of a wide-mouthed phial, and increasing in intensity and strength as pregnancy (of which it is one of the characteristic signs) advances.

In animals exhibiting the second type of placental structure—as, for example, the pig—the placenta is comparatively simple in its structure. 'No *decidua* is developed; the elevations and depressions of the unimpregnated uterus simply acquire a greater size and vascularity during pregnancy, and cohere closely with the chorionic villi, which do not become restricted to one spot, but are developed from all parts of the chorion, except its poles, and remain persistent in the broad zone thus formed throughout foetal life. The cohesion of the foetal and maternal placenta, however, is overcome by slight maceration or post-mortem change; and at parturition, the foetal villi are simply drawn out like fingers from a glove, no vascular substance of the mother being thrown off.' Professor Huxley, from whose *Elements of Comparative Anatomy* (1864, p. 103) the preceding extract is borrowed, follows the opinion adopted by De Blainville, Von Baer, Eschricht, Milne-Edwards, Gervais, and Vogt in regarding 'the features of the placenta as affording the best characters which have yet been proposed for classifying the monodelphous [or placental] mammals.' He proposes to apply the term *deciduate* to those animals whose placenta presents the human type, and which throw off a *decidua*; and to term those animals *non-deciduate* in which the placenta is constructed on the same plan as that of the pig. 'Thus,' he observes, 'man; the apes, or so-called *Quadrumana*; the *Insectivora*; the *Cheiroptera*; the *Rodentia*, to which the lowest apes present so many remarkable approximations; and the *Carnivora*, are all as closely connected by their placental structure as they are by their general affinities. With the pig, on the other hand, the ungulate quadrupeds, and the *Cetacea* which have been studied, agree in developing no *decidua*, or, in other words, in the fact, that no vascular maternal parts are thrown off during parturition. But considerable differences are observed in the details of the disposition of the foetal villi, and of the parts of the uterus which receive them. Thus, in the horse, camel, and *Cetacea*, the villi are scattered as in the pig, and the placenta is said to be *diffuse*; while

no vessel floated *in Ruminants*, the fetal villi are the silence of bundles or cotyledons (fig. 3), which sound of the re convex, and are received into cups

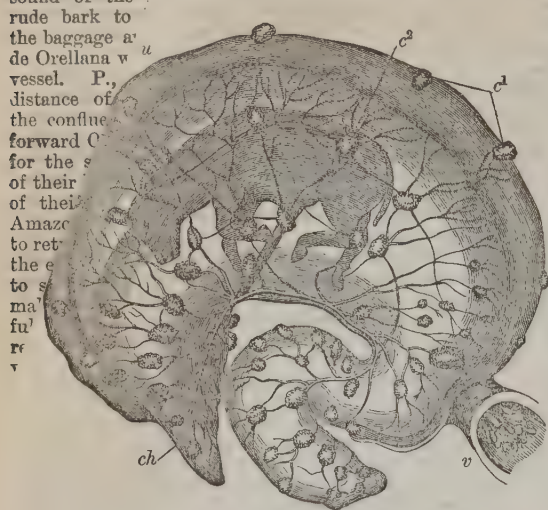

Fig. 3.—Uterus of a Cow in the middle of Pregnancy, laid open :

v, vagina; u, uterus; ch, chorion; c', uterine cotyledons; c'', fetal cotyledons.

of the mucous membrane of the uterus; while in the cow, on the contrary, they are concave, and fit upon corresponding convexities of the uterus.

The remarks which have been made on the functions of the human placenta, are equally applicable to all placental mammals generally.

The diseases of the human placenta had not been studied with any accuracy, until the subject was taken up by Professor Simpson. This distinguished physician and subsequent observers have ascertained that the placenta is liable to (1) congestion, ending in the effusion of blood into the substance of the organ upon its surfaces, or between the membranes; (2) Inflammation, giving rise to adhesions, or terminating in suppuration, which may occasion very serious constitutional disturbances; (3) Partial or entire hypertrophy or atrophy; and (4) Fatty degeneration, affecting its small vessels. Whatever be the form of disease by which the placenta is attacked, the result is usually fatal to the fetus.

PLACENTA, in Botany, a membrane of the interior of the Germen (q. v.) or ovary, to which the ovules are attached either immediately or by Umbilical Cords (q. v.). The placenta sometimes appears as a mere thickening of the walls of the germen. In many cases, it is a more decided projection from the walls of the germen. When thus connected with the walls of the germen, the placenta is described as *parietal* (Lat. *paries*, a wall). But in some plants, the placenta is a column in its axis, and they are then described as *axile*. This distinction is of great importance as characterising different natural orders. Parietal placenta are formed where the edges of carpellary leaves unite; but great difficulty has been experienced by vegetable physiologists in explaining the formation of axile placenta; some regarding them as also originally formed in this manner, and others as formed in a quite different manner from the axis itself; nor is it impossible that both theories may

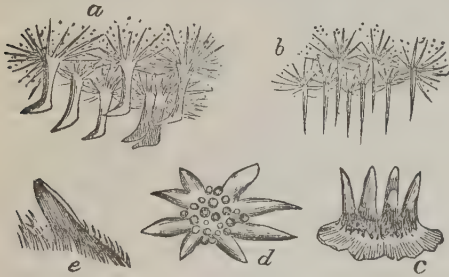

be correct as to different orders of plants. It is certain that in many cases in which the placenta appear as axile, they are formed from the edges of the carpellary leaves which fold in to meet in the axis, and form *Dissepiments* (q. v.) between the cells of the germen. The number of placenta corresponds with the number of carpels in the germen, or appears to be the double of it, each carpel producing two rows of ovules instead of one. See figures in article **PISTIL**.

PLACENZA. See **PIACENZA**.

PLACETUM REGIUM, called also **PLACET**, **EXEQUATUR**, **LETTERES PATENTES**, is an act or instrument executed in virtue of the privilege claimed by the government in certain kingdoms to exercise a supervision over the communications of the Roman pontiff with the clergy and people of those kingdoms, and to suspend or prevent the publication of any brief, bull, or other papal instrument which may appear to contravene the laws of the kingdom, or to compromise the public interest. The early Christian emperors, it is well known, freely stretched their legislation into the affairs of the church; and one constant cause of conflict between church and state, in the medieval period, was the attempt, on the part of the sovereigns, to control the free intercourse of the pope with the several churches. In the Pragmatic Sanction in France, and in the similar legislation of Spain, Portugal, Sicily, and the Low Countries during the 15th c., the claims of the state on the same head are more than once asserted; and among the so-called 'liberties' of the later Gallican Church was a certain, though not a complete subjection to the state in this particular; but it was in the German states that this claim was most distinctly asserted, and most formally embodied in the constitutional law. The principle upon which the Peace of Westphalia, so far as regards its religious provisions, is based, is that the will of the sovereign of the state is supreme and final in all the concerns of religion. *Cujus regio illius et religio* ('Whose the territory, his also the religion'), became the maxim of church government; and, of course, within certain limits, the Catholic sovereigns acted as freely upon it as the Protestant. This intermixture of the spiritual and the temporal prevailed especially in the mixed governments of the ecclesiastical sovereigns of Germany, the prince-bishops of the Rhine; but without the same foundation, the system was carried to its height in Austria under Joseph II. (see **FEBRONIANISM**, **PIUS VI.**), the excessive minuteness of whose ecclesiastical ordinances procured for him the sobriquet of 'The Sacristan.' Under him, all pontifical bulls, briefs, and constitutions, and all the ordinances of the local bishops, were made subject to the imperial censorship, and it was forbidden to publish any of them without its receiving the *placet* of the emperor. The only exception, in the case of pontifical decrees, regarded those emanating from the Roman Penitentiary (q. v.), which, as being of their nature secret, were not held subject to revision. In Prussia, the same law was enforced, as also in Baden and Saxony, no less than in the Protestant governments of Würtemberg, Saxe-Gotha, Saxe-Weimar, &c. These claims of the state had always been the subject of protest on the part of the Roman see, but the church, nevertheless, had been compelled to acquiesce silently in the enforcement. In many cases, however, they have led to serious disputes, of which the mixed-marriage question in Prussia furnished a recent and very

remarkable example. On the whole, nevertheless, the results have involved less of conflict than might have been expected. The general relaxation of absolutist principles in the government, whether of state or of church, which followed the revolution of 1848, has led to very considerable modifications of these regulations in almost all the German states; and in Austria especially, the concordat has involved many important changes in every department of ecclesiastical ordinance.

PLACOID FISHES, an order of fishes, in the classification proposed by Agassiz, characterised by having *placoid* (Gr. *plax*, a broad plate) scales, irregular plates of hard bone, not imbricated, but placed near together in the skin. These scales or plates are of considerable size in some fishes, but in others they are very small tubercles, as in the dogfish, of which the skin forms fine-grained

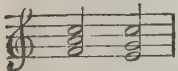

Placoid Scales:

a and *b*, placoid scales of *Aleuteres trossulus*, one of the Ball-tides, from Australia; *c*, *d*, *e*, scales from different parts of the body of *Aleuteres variabilis*.

shagreen. Agassiz includes among the P. F. those cartilaginous fishes which have no scales. The order is exclusively composed of *Cartilaginous fishes* (q. v.). The existing P. F. are few in comparison with the fossil genera and species. Placoid scales are often elevated in the middle, the centre sometimes rising into a strongly projecting point or spine. They exhibit great variety of forms, sometimes even in different parts of the same fish.

PLAGAL, a musical term, principally applicable to *Canto Fermo* and signifying collateral. Gregory the Great, in revising the labours of Ambrose, and remodelling the Plainsong (q. v.) of the church, added to the scales of Ambrose, which he distinguished as authentic, certain other collateral scales, which he called plagal, possessing the peculiarity of having the octave so divided that the fourth was above the fifth. Melodies are now known as plagal which have their principal notes contained between the fifth of the key and its octave or twelfth. The cadence, consisting of the subdominant harmony followed by the tonic, is called the plagal cadence—

PLAGIOSTOMI (Gr. transverse-mouthed), an order of fishes, in the system of Müller, containing the cartilaginous fishes with Placoid (q. v.) scales, and divided into two sub-orders, one containing sharks, and the other rays. The P. have five or more gill-openings. They have no air-bladder. Impregnation takes place before the eggs are deposited, and the males are furnished with *claspers*.

PLAGUE, a very malignant kind of contagious fever prevailing at certain times and places

epidemically, characterised by buboes, or swellings of the lymphatic glands, by carbuncles and petechiæ, and not apparently furnishing any security against its recurrence in the same individual. For a history of the origin of the plague in the far East (China), and its gradual spread, under the name of the *Black Death* (q. v.), through Asia and Europe, in the 14th c., the reader is referred to Hecker's *Epidemics of the Middle Ages* (1844, published by the Sydenham Society). Its true and permanent home seems to be in the regions bordering upon the eastern extremity of the Mediterranean. At different periods of the 15th, 16th, and 17th centuries, it visited Western Europe. It last attacked London and England almost generally in the years 1663—1665; while so late as 1720, it destroyed nearly half the population of Marseille; and seventy years afterwards, prevailed in Russia and Poland, since which time it has been almost unknown in Western Europe. It is now limited chiefly to Egypt, Syria, Anatolia, Greece, and Turkey, occasionally extending northward towards Russia, and westward as far as Malta.

The disease usually commences with a sensation of intense weariness and fatigue, slight shivering, nausea and sickness, confusion of ideas, giddiness, and pain in the loins. These symptoms are rapidly followed by increased mental disturbance, with occasional stupor and delirium, by alternate pallor and flushing of the face, by suffusion of the eyes, and a feeling of intense constriction in the region of the heart. Darting pains are felt in the groins, armpits, and other parts of the body, which are soon followed by enlargements of the lymphatic glands, or *buboes* (which sometimes appear on the first and second day, sometimes not till near the close of the disease, and sometimes are altogether absent), and by the formation of *carbuncles* on various parts of the body. As the disease advances, the tongue becomes dry and brown, while the gums, teeth, and lips are covered with a dark fur; the bowels, at first constipated, become relaxed, the stools being dark, offensive, and sometimes bloody. The power of the will on the muscles is much impaired; and altogether the patient resembles a person under the influence of intoxication. Throughout the disease, there is more or less tendency to faintness; and usually about the second or third day, petechial spots, livid patches like bruises, and dark stripes (called *vibices*), appear upon the skin, especially in severe cases. These discolorations are owing to the extravasation of blood, and are often accompanied with hæmorrhagic discharges from the mucous membranes. In fatal cases, the pulse gradually sinks, the surface becomes cold and clammy, blood oozes from the mucous surfaces, there is coma, or low delirium; and death occurs usually in five or six days, either without a struggle, or preceded by convulsions.

Great difference of opinion exists as to the cause of plague. Some maintain that it is propagated exclusively by a peculiar contagion; others, while admitting its contagious nature, maintain that it may also be spontaneously engendered by endemic or epidemic influences; while others, again, reject the contagion view altogether, and assert that it originates exclusively in local causes or epidemic influences. Of these three views, the great mass of evidence goes to show that the second is the correct one. Whatever may be the cause of the disease, temperature appears to exert a considerable influence over it. In tropical climates, the disease is unknown, and the cold weather of northern climates has been observed to check its ravages. In Europe, it has always been most fatal in the summer and autumn, especially in September. Thus, in the

great plague of London in 1665, the deaths from the plague were, in June, 590; in July, 4129; in August, 20,046; in September, 26,230; in October, 14,373; in November, 3449; while in December, they were less than 1000.

The exact nature of the disease is unknown. A poison whose characters evade all chemical and microscopical examination, is absorbed, and alters at once, or after a short stage of incubation, the composition of the blood and the condition of the tissues.

With respect to treatment, little can be done to arrest the progress of the disease in any individual case. The patient should, if possible, be removed at once from the source of the disease; he should be exposed freely to fresh air; his secretions should be duly regulated, and his strength supported as far as possible. Friction with olive oil has been strongly recommended, but subsequent experience has not confirmed the first reports in its favour. But although treatment is comparatively valueless, much may be done towards guarding against the attacks of the disease. There can be little doubt that it is in consequence of the free external use of cold water, perfect cleanliness, moderate habits of life, and superior ventilation, that European (especially English) residents in the infected cities of the Levant are comparatively exempt from this disease. It is very possible that inunction of the body with olive oil may be (as has been asserted) a useful prophylactic agent, although it fails to cure the disease. It is almost needless to add, that all unnecessary communication with the sick, or contact with clothes or other matter that may have been infected with the poison, should be as much as possible avoided.

PLAICE (*Platessa vulgaris*), a species of Flounder (q. v.), much resembling the common flounder, but rather broader in proportion to its length; the upper surface of the body and the fins olive-brown, marked with large bright orange spots; a row of similar spots on the dorsal fin and on the anal fin; no tubercular asperities on any part of the body, but a curved row of bony tubercles on the eye-side of the head. The P. inhabits sandy and muddy banks, not in very deep water, and is very abundant on most parts of the British coasts, as well as on those of continental Europe. Like the common flounder, it often ascends slow rivers to some distance from the sea, and it has even been found to thrive well when transferred to fresh-water ponds. It feeds on worms, molluscs, small crustaceans, and young fishes. It has been known to attain the weight of fifteen pounds, but a P. of seven or eight pounds is accounted large. It is taken both by lines and trawl-nets. It is in considerable esteem for the table, although so plentiful in the British markets, that it is in general very cheap.

PLAID, a woollen garment, in the form of a large scarf, to wrap round the body, and used chiefly among the rural population of Scotland. See **TARTAN**.

PLAIN, in Geography, is an extensive tract of country which, on the whole, preserves a nearly uniform elevation. When referred to the level of the sea, plains may be distinguished into low plains or lowlands, and elevated plains called plateaux or *Table-lands* (q. v.). Plains differ much in appearance, according to the nature of their soil and climate, from the frightful sandy wastes of Africa, to the luxuriant fertility of the South American silvas. They are occasionally crossed by hills of moderate altitude, which, however, are generally detached, and exhibit no connection with

any neighbouring mountain system. These hills often, as in the North American plains, degenerate into mere undulations, perfectly uniform in structure. The term 'plains' is, in a limited sense, confined to the plains of Western Europe; those of other parts of the world receiving special designations, and differing from each other in many important points; thus, we have the *Steppes* (q. v.) of Eastern Europe and Asia; the *Deserts* (q. v.) of Arabia and Africa; the *Savannahs* (q. v.) and *Prairies* (q. v.) of North America; and the *Llanos* (q. v.), *Pampas* (q. v.), and *Silvas* (q. v.) of South America. The chief plains of Europe are, the country stretching from the foot of the Carpathians in Galicia to the Ural Mountains (including Poland and Russia), the drainage-area of the Danube in Hungary, and the portion of Europe which is bounded by the Elbe, the Harz Mountains, France, and the sea. Plains of comparatively small extent, but presenting the necessary characteristics in perfection, are found in almost all countries.

PLAINSONG, or **CANTO FERMO** (Ital.), a name given by the Church of Rome to the ecclesiastical chant. It is an extremely simple melody, admitting only notes of equal value, rarely extending beyond the compass of an octave, and never exceeding nine notes, the staff on which the notes are placed consisting of only four lines. The clefs are C and F. St Ambrose is considered to have been the inventor or systematiser of Plainsong. His labours consisted in selecting from the extremely complicated system of the Greeks a set of scales sufficiently few and simple for a very rude people. During the two centuries succeeding the death of Ambrose, his institutions fell into utter confusion. Gregory the Great revived and perfected them, recasting them into an *Antiphony*, or authorised body of ecclesiastical music, and brought Plainsong into the state in which it is yet used in the Roman church. See **AMBROSIAN CHANT** and **GREGORIAN CHANT**.

PLAINTIFF, in English and Irish Law, is the name given to the person who institutes and maintains a civil action or suit against another, who is called the Defendant. In Scotland, a plaintiff is called a Pursuer. But in both countries, many proceedings and applications of a civil nature are commenced by petition; and hence the party taking the initiative is called the Petitioner.

PLAN, a word frequently applied to all kinds of architectural drawings, but which ought to be limited to those which represent the horizontal sections of the various floors of buildings. Plans shew the disposition of the apartments and walls, with the situation of the fireplaces, cupboards, doors, &c.; they, in fact, represent the different stories as they actually appear as seen from above, when the walls are built two or three feet above the level of each floor.

PLANARIA, a genus of worms placed by Cuvier among *Entozoa*, although not parasites, but inhabitants of stagnant waters, because of their great resemblance to some of the entozoic parasites, and particularly to flukes. The species are numerous. Some inhabit fresh, and others salt water; they feed on small annelids, molluscs, &c. They are generally found creeping among conifers, or on the stems of plants. Many of the larger marine species are able to swim freely by flappings of the broad margins of their bodies. The body of a planaria seems to be entirely gelatinous; but M. de Quatrefages has detected under the skin an arrangement of muscular fibres. Two red specks in the fore-part of the body of many species have been supposed to be eyes; but there is no proof of

It. *Planariae* are hermaphrodite, but copulate for mutual impregnation. Their power of multiplication by division is very great; if an individual be cut in pieces, each piece continues to live and feel, and 'even if it be the end of the tail, as soon as the first moment of pain and irritation has passed, begins to move in the same direction as that in which the entire animal was advancing, as if the body was actuated throughout by the same impulse; and, moreover, every division, even if it is not more than the eighth or tenth part of the creature, will become complete and perfect in all its organs.'—*Rymer Jones*.

PLANE, in Geometry, is a surface without curvature, and the test of it is, that any two points whatever being taken in the surface, the straight line which joins them lies wholly in the surface. When two planes cross or intersect one another, their common section is a straight line; and the inclination of the planes to each other is measured by taking any point in their common section, and drawing from it two straight lines, one in each plane, perpendicular to the common section; the angle contained by these lines is the angle of inclination of the planes. When the angle is a right angle, the planes are perpendicular to each other.

PLANE (*Platanus*), a genus of trees, the sole genus of the natural order *Platanaceæ*, regarded by many as a sub-order of *Amentaceæ* (q. v.). The flowers are in globose stalked catkins; the ovary is one-celled, and contains one or two pendulous

Plane Tree (*Platanus orientalis*).

ovules. The species of *P.* are few; natives of temperate climates in the northern hemisphere; tall trees, with smooth whitish bark, which annually scales off in large pieces, and large palmate deciduous leaves. The catkins are small, and curiously placed one above another on the same stalk; they are pendulous, with long stalks, and give plane trees a very peculiar appearance, especially in winter, when they remain after the leaves have fallen.—The ORIENTAL *P.* (*P. orientalis*), a native of Greece and the East, was much admired and planted, both by the Greeks and the Romans, as an ornamental tree; no other tree, indeed, commanding equal admiration; and, for centuries, the youth of Greece assembled under the shade of planes, in the groves of Academus and elsewhere, to receive lessons in philosophy. To this day, the *P.* is generally planted for shade and ornament in

the south of Europe. Many fine trees exist in England, but they were at one time much more numerous, great part having died in the end of last century, probably from some disease similar to the potato disease. The injury often done to the young leaves by late frosts, and the insufficient duration of the summer for the proper ripening of the wood, render the *P.* less suitable for Scotland; yet there is a tree at Gordon Castle 66 feet high. No tree better endures the atmosphere of a large city, and there are no finer trees within the precincts of London than the *P.* trees which are to be seen in some places there. In its native regions the *P.* attains an immense size. One tree, which grows in the meadow of Buyukdere on the banks of the Bosphorus, is 141 feet in circumference at the base—its trunk being apparently formed of several which have grown together—extends its branches 45 feet from the trunk, and is believed to be more than 2000 years old. The wood of the *P.*, when young, is yellowish-white; when old, it is brownish, fine grained, takes a high polish, and is esteemed for cabinet-making. A rich alluvial soil and the vicinity of water are most suitable to this tree.—The NORTH AMERICAN *P.*, or BUTTONWOOD (*P. occidentalis*), is a very similar tree. It is the largest deciduous tree of the United States, and abounds on the banks of the great rivers of the middle states. Its timber is not very valuable, and is very liable to decay. It is sometimes called the *Cotton Tree*, from the wool which, as in the former species, covers the under side of the young leaves, and which, being cast off, floats about on the wind. A tree of this species on the bank of the Thames, in Chelsea Hospital gardens, is 115 feet high, with a trunk five feet in diameter.—The name *P.*-tree is commonly given in Scotland to the Sycamore (*Acer pseudo-platanus*), which resembles the true planes in its foliage.

PLANE, a tool used for rendering the surface of wood smooth and level. It consists of an oblong block of wood or metal (the latter is only just coming into use), with an opening through the centre; this opening is square on the upper side, and is always large enough to admit the cutting instrument; it diminishes down to a mere slit on the under side, merely wide enough to allow the cutting edge of the plane-iron and the shaving of wood which it cuts off to pass through. The form

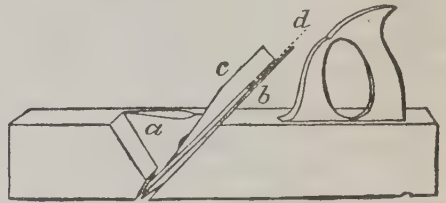

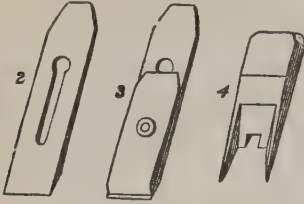

Fig. 1.

of this opening will be seen at *a*, fig. 1, which represents the section of a common jack-plane. The essential part of the tool is the plane-iron, a piece of steel with a chisel-shaped edge, and a slot in its centre for a large headed screw to work and to attach to it a strengthening plate. Fig. 2 shews the plane-iron, and fig. 3 the same with the strengthening plate attached; these are shewn in their proper position at *bd* in the section fig. 1, and they are held in place by the hard-wood wedge (fig. 4), seen also in the section at *c*. By driving in the wedge, the irons are held very firmly in their place, and they are so adjusted that only the fine

sharp chisel-edge of the cutting-tool projects through the slit in the bottom of the body of the plane, so that when the tool is pushed forward by the force of the hand, the cutting edge pares off all irregularities, until the wood is as smooth as the under

surface of the plane. There are many modifications in this tool, which can have its cutting edge and under surface made to almost any contour, so that mouldings of all kinds may be made. The two commonest are the jack-plane for rough work, and the smoothing-plane for finishing off plane surfaces.

PLANING-MACHINES have lately been much in use, by which both wood and metal are planed. In the case of those intended for wood, the cutting instruments are moved forward over the wood by machinery in the same manner as in the hand-plane. The precision and rapidity with which these machines work have given great facilities for building, as one machine will do as much work as sixty men. The planing-machines used for metal are different in principle. A well-tempered, chisel-edged steel cutter is held in a fixed position, pressing downwards upon the metal plate, which is moved forward by powerful machinery. The action of this movement is, that a groove is ploughed into the metal of the size of the steel cutter; when the metal has travelled its full length, and has made the groove complete, the downward pressure of the tool is removed, and by the action of the double screw which has carried it forward, it is returned, and readjusted for another groove to be formed by the side of the first; and this is repeated until the whole surface of the plate is reduced to the required level. However tedious this process may appear, it offers such facilities for metal working as were previously unknown.

PLANETA, the Greek name of the vestment called by the Latins Casula, and in English 'Chasuble,' which is worn by priests in the celebration of mass. The form of this vestment in the modern Roman church, differs both from the ancient form and from that in use in the Greek church. The change appears to date from the 9th c., but has been gradual. A certain modification of the Roman planeta was recently introduced in England under the inspiration of the late Mr Pugin, the great reviver of Gothic architecture and ecclesiastical costume and decoration. But its use has been only partial even in England.

PLANETARIUM, a machine much employed by astronomers in the 17th and 18th centuries, and first constructed by Huyghens and Römer, for the purpose of exhibiting clearly the motion of the heavenly bodies in conformity with the Copernican doctrine. The P. exhibited only the orbital motions of the planets about the sun, either in circles or ellipses, and with constant or varying motions, according to the perfection of the machine. It was subsequently supplemented by the combined tellurian and lunarian, which exhibited at one and the same time the motion of the moon about the earth and that of the latter round the sun, with the principal phenomena (such as the succession of day and night, the varying length of each, eclipses, and

the motion of the moon's apogee and nodes) which accompany these motions. A *satellite machine* was also invented to illustrate the motions of Jupiter's satellites. All these machines are now combined in the Orrery (q. v.), which exhibits in the best manner possible the varied motions and phenomena of the bodies in the solar system.

PLANETOIDS, or ASTEROIDS, the name given to that numerous group of very small planets which are situated in the solar system between Mars and Jupiter. Till the present century they remained undiscovered; but for some years before, their existence had been suspected, mainly owing to the remarkable hiatus in the series of the planetary distances when compared with the law of Bode (q. v.). On the first day of the present century the first of them was detected by Piazzi of Palermo, and his success roused his brother astronomers to search for more planets. Their search was successful, for Olbers (q. v.) discovered two in 1802 and 1807, and Harding one in 1804; but as all researches for some time subsequent to 1807 were unavailing, astronomers gradually allowed themselves to settle down into the belief that no more planetoids remained to be discovered, when the detection of a fifth by Hencke in 1845, revived the hope of fresh discoveries, and from this period no year (excepting 1846) has passed without adding to the list. The number at present (1871) known is 112. This remarkable success of the astronomers of our time is due to the systematic manner in which the zodiacal belt has been explored, and the place and apparent size of every star of this region distinctly determined; so that the presence of a wandering body can at once be detected.

The magnitudes of these celestial bodies have not been accurately ascertained, but it is certain that they are exceedingly small as compared even with Mercury, the least of the other planets; the diameter of the largest among them being generally believed not to exceed 450 miles, while most of the others are very much smaller than this. They also differ, generally speaking, from the rest of the planets in other respects; their orbits are of greater eccentricity, are inclined to the ecliptic at a greater angle, and are interlaced in a most intricate manner, crossing each other so frequently as to form, when viewed perpendicularly, a kind of network. The consequence of this is, that a planetoid which is nearest the sun at one part of its orbit, is, when at another part of its orbit, further from it than are several of the others, and a mutual eclipsing of the sun at different periods by two planetoids must be of very frequent occurrence. From the generally large size of their angle of inclination to the ecliptic, many of them occasionally travel far beyond the limits of the zodiac, and are thence termed *ultra-zodiacal planets*. Of 81 planetoids, Flora has the shortest period of revolution (1193 days), and consequently, by Kepler's third law, its mean distance from the sun is a little over 209 millions of miles; Maximiliana has the longest period (2343 days), and its mean distance from the sun is about 330 millions of miles. Concordia's orbit has least eccentricity, that element amounting to little more than $\frac{1}{4}$ of the major axis, while in Polyhymnia it amounts to more than $\frac{1}{2}$. Massalia's orbit makes a smaller angle—only $41^{\circ} 7'$ —with the ecliptic than that of any other planet in the solar system, while the inclination of the orbit of Pallas is no less than $34^{\circ} 42' 41''$. After the first two or three of these bodies had been discovered, the opinion was propounded by Olbers that they were but the fragments of some large planet; which received corroboration from the intimate connection shewn to subsist among them. In

PLANETOIDS--PLANETS.

1868, 14 new planetoids were discovered (8 by Prof. Watson, of Ann Arbor, Mich.), and on Sept. 20, 1870, the position of the 112th had been determined.

The names of the discoverers, the dates of discovery and periods of revolution of the 81 known in 1864 are as follows [see PLANETOIDS in SUPP., in Vol. X.]:

Name.	Date of Discovery.	Discoverer.	Period of Side Revolution in Days
1. Ceres,	1801, January 1, .	Piazzi, Palermo,	1681.
2. Pallas,	1802, March 28, .	Oibers, Bremen,	1684.
3. Juno,	1804, September 1, .	Harding, Lillenthal (Bremen),	1592.
4. Vesta,	1807, March 29, .	Oibers, Bremen,	1325.
5. Astraea,	1845, December 8, .	Hencke, Driesen (Prussia),	1511.
6. Hebe,	1847, July 1, . . .	Hencke, Driesen (Prussia),	1380.
7. Iris,	1847, August 13, .	Hind, London,	1346.
8. Flora,	1847, October 18, .	Hind, London,	1193.
9. Metis,	1848, April 25, . .	Graham, Sligo,	1347.
10. Hygiea,	1849, April 13, . .	De Gasparis, Naples,	2043.
11. Parthenope,	1850, May 11, . . .	De Gasparis, Naples,	1409.
12. Victoria,	1850, September 13, .	Hind, London,	1301.
13. Egeria,	1850, November 2, .	De Gasparis, Naples,	1511.
14. Irene,	1851, May 19, . . .	Hind, London,	1518.
15. Eunomia,	1851, July 29, . . .	De Gasparis, Naples,	1570.
16. Psyche,	1852, March 17, . .	De Gasparis, Naples,	1826.
17. Thetis,	1852, April 17, . .	Luther, Bilk (Dusseldorf),	1420.
18. Melpomene,	1852, June 24, . . .	Hind, London,	1270.
19. Fortuna,	1852, August 22, . .	Hind, London,	1392.
20. Massalia,	1852, September 19, .	De Gasparis, Naples,	1366.
21. Lutetia,	1852, November 15, .	Goldschmidt, Paris,	1388.
22. Calliope,	1852, November 16, .	Hind, London,	1812.
23. Thalia,	1852, December 15, .	Hind, London,	1566.
24. Themis,	1853, April 5, . . .	De Gasparis, Naples,	2034.
25. Phocæa,	1853, April 7, . . .	Chacornac, Marseille,	1359.
26. Proserpine,	1853, May 5,	Luther, Bilk,	1581.
27. Euterpe,	1853, November 8, .	Hind, London,	1314.
28. Bellona,	1854, March 1, . . .	Luther, Bilk,	1689.
29. Amphitrite,	1854, March 1, . . .	Marth, London,	1492.
30. Urania,	1854, July 22, . . .	Hind, London,	1329.
31. Euphrosyne,	1854, September 1, .	Ferguson, Washington,	2043.
32. Pomona,	1854, October 26, . .	Goldschmidt, Paris,	1520.
33. Polyhymnia,	1854, October 28, . .	Chacornac, Paris,	1778.
34. Circe,	1855, April 6, . . .	Chacornac, Paris,	1609.
35. Leucothea,	1855, April 19, . . .	Luther, Bilk,	1908.
36. Atalanta,	1855, October 5, . .	Goldschmidt, Paris,	1666.
37. Fides,	1855, October 5, . .	Luther, Bilk,	1563.
38. Leda,	1856, January 12, . .	Chacornac, Paris,	1637.
39. Laetitia,	1856, February 8, . .	Chacornac, Paris,	1684.
40. Harmonia,	1856, March 31, . . .	Goldschmidt, Paris,	1247.
41. Daphne,	1856, May 22, . . .	Goldschmidt, Paris,	1779.
42. Isis,	1856, May 23, . . .	Pogson, Oxford,	1392.
43. Ariadne,	1857, April 15, . . .	Pogson, Oxford,	1195.
44. Nysa,	1857, May 27, . . .	Goldschmidt, Paris,	1379.
45. Eugenia,	1857, June 27, . . .	Goldschmidt, Paris,	1610.
46. Hestia,	1857, August 16, . .	Pogson, Oxford,	1470.
47. Melete,	1857, September 9, . .	Goldschmidt (Paris), & Schubert (St Petersburg),	1529.
48. Aglaia,	1857, September 15, .	Luther, Bilk,	1788.
49. Doris,	1857, September 19, .	Goldschmidt, Paris,	1398.
50. Pales,	1857, September 19, .	Goldschmidt, Paris,	1380.
51. Virginia,	1857, October 4, . .	Ferguson, Washington,	1577.
52. Nemausa,	1858, January 22, . .	Laurent, Nîmes (France),	1350.
53. Europa,	1858, February 6, . .	Goldschmidt, Paris,	1993.
54. Calypso,	1858, April 4, . . .	Luther, Bilk,	1543.
55. Alexandra,	1858, September 10, .	Goldschmidt, Paris,	1629.
56. Pandora,	1858, September 10, .	Searle, Albany, New York,	1674.
57. Mnemosyne,	1859, September 22, .	Luther, Bilk,	2043.
58. Concordia,	1860, March 24, . . .	Luther, Bilk,	1619.
59. Olympia,	1860, September 12, .	Chacornac, Paris,	1673.
60. Echo,	1860, September 15, .	Ferguson, Washington,	1352.
61. Danaë,	1860, September 19, .	Goldschmidt, Paris,	1902.
62. Erato,	1860, September 14, .	Fürster, Berlin,	2023.
63. Ausonia,	1861, February 10, . .	De Gasparis, Naples,	1356.
64. Angelina,	1861, March 4, . . .	Tempel, Marseille,	1601.
65. Maximiliana,	1861, March 8, . . .	Tempel, Marseille,	2343.
66. Maia,	1861, April 9, . . .	Tuttle, Cambridge, Massachusetts,	1358.
67. Asia,	1861, April 17, . . .	Pogson, Madras,	1375.
68. Hesperia,	1861, April 23, . . .	Schiaparelli, Milan,	1893.
69. Leto,	1861, April 23, . . .	Luther, Bilk,	1638.
70. Panopea,	1861, May 5,	Goldschmidt, Chatillon (Paris),	1567.
71. Niobe,	1861, August 13, . .	Luther, Bilk,	1671.
72. Feronia,	1862, February 12, . .	Peters (Clinton, Nw York), & Safford (Washington),	1148.
73. Clytie,	1862, April 7, . . .	Tuttle, Cambridge, Massachusetts,	1590.
74. Galatæa,	1862, August 29, . .	Tempel, Marseille,	1509.
75. Eurydice,	1862, September 22, .	Peters, Clinton, New York,	1590.
76. Freya,	1862, October 21, . .	D'Arrest, Copenhagen,	2080.
77. Frigga,	1862, November 12, .	Peters, Clinton, New York,	1360.
78. Diana,	1863, March 15, . . .	Luther, Bilk,	Not determined.
79. Eurynome,	1863, September 19, .	Watson, Ann Arbor, America,	Not determined.
80. Sappho,	1864, May 3,	Pogson, Madras,	Not determined.
81. Terpsichore,	1864, September 30, .	Tempel, Marseille,	Not determined.

PLANETS (Gr. *planētes*, 'a wanderer'), are those heavenly bodies (including the Earth) which belong to our solar system, and revolve in elliptic

orbits round the sun. They are often denominated *primary planets*, to distinguish them from their moons or satellites, which are called *secondary*

planets. The name planet is of considerable antiquity, and was applied to these dependents of the sun to distinguish them from the myriads of luminous bodies which stud the sky, and which present to the naked eye no indication of change of place (see STARS). The planets at present known are, in the order of their distance from the sun, Mercury, Venus, the Earth, Mars, the Planetoids (q. v.), Jupiter, Saturn, Uranus, and Neptune. Six of these, Mercury, Venus, the Earth (which was not, however, then reckoned a planet), Mars, Jupiter, and Saturn, were known to the ancients; Uranus was discovered by Sir William Herschel (q. v.) in 1781; and Neptune, after having its position and elements determined theoretically by Leverrier and Adams, was discovered by M. Challis, and afterwards by Dr Galle, in 1846. The Planetoids, which now number 81, have all been discovered during the present century. Five of the planets, the Earth, Jupiter, Saturn, Uranus, and Neptune, are attended by one or more satellites; Uranus (generally), Neptune, almost the whole of the Planetoids, and all the satellites except the Moon, are invisible to the naked eye. The visible planets can be at once distinguished from the fixed stars by their clear steady light, while the latter have a sparkling or twinkling appearance. The comparative proximity of the planets may be proved by examining them through a telescope of moderate power, when they appear as round luminous disks, while the fixed stars exhibit no increase of magnitude. The planets, as observed from the Earth, move sometimes from west to east, sometimes from east to west, and for some time remain stationary at the point where progression ends and retrogression commences. This irregularity in their movements was very puzzling to the ancient astronomers, who invented various hypotheses to account for it. See PTOLEMAIC SYSTEM and EPICYCLE. The system of Copernicus, by assuming the sun, and not the earth, as the centre of the system, explained with admirable simplicity what seemed before a maze of confusion.

The planetary orbits differ considerably in their degrees of excentricity, the Planetoids, Mars, and Mercury being most, and the larger planets least excentric. No two planets move exactly in the same plane, though, as a general rule, the planes of the larger planets most nearly coincide with that of the ecliptic. The latter are consequently always to be found within a small strip of the heavens extending on both sides of the ecliptic; while the others have a far wider range, Pallas, one of them, having the angular elevation of its orbit no less than $34^{\circ} 35'$ above the ecliptic. According to Kepler's Laws (q. v.), the nearer a planet is to the sun the shorter is the time of its revolution. The arrangement of the planets in the solar system bears no known relation to their relative size or weight, for though Mercury, Venus, and the Earth follow the same order in size and distance from the sun, yet Mars, which is further from the sun, is much less than either the Earth or Venus, and the Planetoids, which are still further off, are the least of all. Jupiter, which is next in order, is by far the largest, being about $1\frac{1}{4}$ times as large as all the others together; and as we proceed further outwards, the planets become smaller and smaller, Saturn being less than Jupiter, Uranus than Saturn, and Neptune than Uranus.

With reference to their distance from the sun, as compared with that of the Earth, the planets are divided into *superior* and *inferior*; Mercury and Venus are consequently the only 'inferior' planets, all the others being 'superior.' The inferior planets must always be on the same side of the Earth as the sun is, and can never be above the horizon of

any place (not in a very high latitude) at midnight; they are always invisible at their superior and inferior conjunctions, except when, at the latter, a *Transit* (q. v.) takes place. The superior planets are likewise invisible at conjunction, but when in opposition they are seen with the greatest distinctness, being then due south at midnight. The time which elapses from one conjunction to its corresponding conjunction is called the *synodic period* of a planet, and in the case of the inferior planets must always be greater than the true period of revolution.

Mercury, the planet which is nearest the sun, is also, with the exception of the Planetoids, the smallest (being only 3 times the size of the moon), and performs its revolution round the sun in the shortest time. Its greatest elongation is never more than $28^{\circ} 45'$, and consequently it is never above the horizon more than two hours after sunset, or the same time before sunrise; on this account, and from its small apparent size ($5''$ to $12''$), it is seldom distinctly observable by the naked eye. It shines with a peculiarly vivid white or rose-coloured light, and exhibits no spots.—

Venus, the next in order of distance and period, is to us the most brilliant of all the planets. Its orbit is more nearly a circle than any of the others, and when at its inferior conjunction, it approaches nearer the Earth than any other planet. Its apparent angular dimensions thence vary from $10''$ at the superior, to $70''$ at the inferior conjunction. Its greatest elongation varies from 45° to $47^{\circ} 12'$, and therefore it can never be above the horizon for much more than three hours after sunset, or the same time before sunrise. While moving from the inferior to the superior conjunction, Venus is a *morning star*, and during the other half of its synodic period an *evening star*. When this planet is at an elongation of 40° , its brilliancy is greatest, far surpassing that of the other planets, and rendering a minute examination through the telescope impossible. At this period it sometimes becomes visible in the daytime, and after sunset is so bright as to throw a distinct shadow. Astronomers have repeatedly attempted to ascertain the nature and characteristics of its surface, but its brightness so dazzles the eyes as to render the correctness of their observations at best doubtful. From the changes in the position of dusky patches on its surface, which have been frequently noticed, it is concluded that it revolves on its axis, and that its equator is inclined to the plane of its orbit at an angle of 75° , but many astronomers (Sir John Herschel included) profess to doubt these conclusions. Both Venus and Mercury necessarily exhibit phases like the moon.—The *Earth*, the next planet in order, will be found under its own name; it has a single satellite, the *Moon* (q. v.).—*Mars*, the first of the superior planets, is much inferior in size to the two previous, its volume being about $\frac{1}{4}$ th of the Earth's, and, after Mercury, its orbit is much more excentric than those of the other planets. When it is nearest to the Earth (i. e., in opposition), its apparent angular diameter is $30''$; but when furthest from it (i. e., in conjunction), its diameter is not more than $4''$. Mars is less known than the rest of the superior planets, owing to its not possessing a satellite, by the motions of which its attractive force (and hence its mass and density) could be estimated. It shines with a fiery red light, and is a brilliant object in the heavens at midnight when near opposition; when seen through the telescope its surface appears to be covered with irregular blotches, some of them of a reddish, others of a greenish colour, while at each pole is a spot of dazzling white. The red spots are surmised to be

(and; the green, water; while the white spots at the poles are with some reason supposed to be snow, since they decrease when most exposed to the sun, and increase under the contrary circumstances. The Phases (q. v.) of Mars range between full, half, full (in conjunction, if visible), and half.—After Mars in order come the *Planetoids* (q. v.), formerly but improperly called *Asteroids*.—*Jupiter*, the next in order, is the largest of all the planets, its bulk being more than 1400 times that of the Earth, though, from its small density, its mass is only 338 times more. After Venus it is the brightest of the planets and the largest in apparent size, its angular diameter varying from 30' to 45'. When looked at through a telescope, it is seen to be considerably flattened at the poles, owing to its rapid revolution on its own axis; and its surface is crossed in a direction parallel to its equator by three or four distinct and strongly-marked belts, and a few others of a varying nature. Spots also appear and remain for some time on its surface, by means of which its revolution on its axis has been ascertained. This planet is attended by four satellites, which are easily observable through an ordinary telescope, and which have rendered immense service in the determination of longitudes at sea, and of the motion and velocity of light. The satellites, which were discovered by Galileo, were proved by Sir William Herschel to revolve on their own axes in the same time that they revolve round their primary. The smallest is about the same size as our Moon, the others are considerably larger.—*Saturn*, the next in position, is about 735 times larger in volume, though only about 100 times greater in mass than the earth. Its apparent diameter when in opposition is 18", and there is a considerable flattening towards the poles. Its surface is traversed by dusky belts much less distinctly marked than those of Jupiter, owing doubtless in great part to its inferior brightness; its general colour is a dull white or yellowish, but the shaded portions, when seen distinctly, are of a glaucous colour. The most remarkable peculiarity of Saturn is its ring, or series of concentric rings, each one parallel and in the same plane with the others, and with the planet's equator; the rings are at present supposed to be three in number, the two outermost are bright like the planet itself, while the innermost is of a purplish colour, and is only discernible through a powerful telescope. The rings are not always visible when Saturn is in the 'opposite' half of its orbit, for when the plane of the rings is intermediate between that of the earth's orbit and of the ecliptic, their dark surface is turned towards us, and when the sun is in their plane only the narrow edge is illuminated; in both of these cases the ring is invisible from the Earth. Its plane being inclined at an angle of 28° to the ecliptic, we see the two surfaces of the ring alternately for periods of 15 years at a time; and at the middle of each period, the rings attain their maximum obliquity to the ecliptic, and are then best seen from the Earth. It is hardly necessary to remark that at the end of each period they become invisible. Saturn has also no less than eight* satellites, seven of which revolve round it in orbits little removed from the plane of the ring, while the eighth, which is the second in size, is considerably inclined to it. Two of the satellites were discovered by Herschel in 1787 and 1789, four by Cassini in 1672 and 1684, one by Huyghens in 1655, one by Mr Lassell in England and Professor Bond in America in 1848. The satellites are all situated

outside of the ring, and the largest of them is nearly equal to the planet Mars in size.—*Uranus*, the next planet in position, was discovered accidentally by the elder Herschel on 13th March 1781, and was named 'the Georgium Sidus' and 'Herschel,' but these names soon fell into disuse. It is about 96 (some astronomers say 82) times greater than the Earth in volume, and 20 (according to others, 15) times in mass; but though so large, its distance is so much greater in proportion that astronomers have been unable to gain much information concerning it. No spots or belts have hitherto been discovered on its surface, and consequently its time of rotation and the position of its axis are unknown. It is attended by a number of satellites, but so minute do these bodies appear, that astronomers hitherto have been unable to agree as to their exact number; Sir William Herschel reckoned six, while other astronomers believe in the existence of four, five, and eight respectively. That there are at least four is without doubt.—The next and outermost member of the solar system is *Neptune*, which, at a distance of nearly 3000 millions of miles from the centre of the system, slowly performs its revolution round the sun, accomplishing the complete circuit in about 165 solar years. It is about 84 times larger than the Earth, but from its extreme remoteness is of almost inappreciable magnitude when seen through an ordinary telescope. It was the disturbance in the motion of Uranus caused by the attractive force of this planet which led Leverrier and Adams to a calculation of its size and position, on the supposition of its existence, and the directions which were given by the former to Dr Galle of Berlin, specifying its exact position in the heavens, led that astronomer to its discovery on 23d September 1846. Mr Lassell of Liverpool has discovered that Neptune is attended by one satellite. The satellites of Uranus and Neptune differ from the other planets, primary and secondary, in the direction of their motion, which is from east to west, and in the case of the former, in planes nearly perpendicular to the ecliptic. Both Uranus and Neptune were observed long before the times of Herschel and Leverrier, but they were always supposed to be stars. Uranus is known to have been observed by Flamsteed between 1690 and 1715, and Neptune by Lalande in 1795. For the periods, distances, size, density, &c., of the planets, see SOLAR SYSTEM. In astronomical tables, almanacs, &c., the planets are for convenience denoted by symbols instead of their names, as follows: Mercury, ☿; Venus, ♀; Earth, ⊕; Mars, ♂; the Planetoids, in the order of their discovery, ①, ②, ③, &c.; Jupiter, ♃; Saturn, ♄ or ♅; Uranus, ♅; Neptune, ♆; the Sun, ☉; the Moon, ☾.

PLANT, a living organic being, destitute of any indication of mind or feeling, and sometimes defined as essentially differing from an animal in the want of voluntary motion. Plants are the organisms which form the *Vegetable Kingdom*. The science which treats of plants is called Botany (q. v.), of which there are several important branches.

The difference between plants and animals is sometimes difficult to discern, but only in some of the groups, which must of necessity be referred to the lowest place whether in the animal or vegetable kingdom. Plants of higher organisation can never be mistaken for animals, nor animals of higher organisation for plants. Instead of a regular ascending and descending scale of organisms, from the highest animal to the lowest plant, we find a widely-extended base from which the ascent seems to begin at once in both the organic kingdoms, with many ramifications in each; and perhaps that we do not at once recognise the difference even in the lowest

* The existence of a ninth satellite was suspected by M. Goldschmidt in April 1861, but his observation has not been verified.

organisms, may be owing to our ignorance and incapacity of proper observation.

Something which resembles the voluntary motion of animals is to be seen in some plants, in various phenomena of Irritability (q. v.); and there is even locomotion in the vegetable kingdom wonderfully simulating voluntary locomotion, a provision of nature for the diffusion of some of the lower vegetable organisms; the *Gonidia* (q. v.) of Algae and the *Spermatozoidia* (q. v.) of some other cryptogamous orders moving in a surrounding fluid by means of cilia, so that they have often been mistaken for animalcules. But no motion which can really be deemed voluntary takes place in the vegetable kingdom; and no animal, certainly to be pronounced such, fails to exhibit it—even when there is no power whatever of locomotion—in the prehension of food, or for some of the purposes of life.

The general laws which govern life prevail in plants as in animals. There are organs of nutrition and organs of reproduction; the whole being made up of organs, and every organ destined to maintain the existence either of the individual or of the race. But there is nothing in plants corresponding to the mouth, stomach, and alimentary canal of animals. Nutrition takes place in a different manner; assimilation being effected by a process very unlike that of digestion in animals. There are, however, animals destitute of a mouth, stomach, and alimentary canal; so that the distinction between plants and animals cannot be stated so absolutely in this respect as in respect to voluntary motion; and as there are many plants which have no roots, nutrition by means of roots, although peculiar to the vegetable kingdom, is not its distinguishing characteristic. The nutriment of plants is derived either by their roots from the soil (see *Root*), or through the integuments of their other parts from the air or water in which they live; and all their nutriment is either liquid or gaseous, being taken up in the former case by Endosmose (q. v.), and in the latter case through *Stomata* (q. v.). Many plants, and among them the greater number of phanerogamous plants, owe their nourishment both to the soil and to the atmosphere, their roots deriving it from the former, and the Leaves (q. v.) of plants that have leaves being the principal organs by which they derive it from the latter. When leaves are wanting, the integument of the parts exposed to the air performs the functions ordinarily assigned to them. Solid matter cannot be appropriated by plants until it has been dissolved in water, or decomposed. See *MANURE* and *SOIL*.—The nutriment appropriated by the plant is not assimilated until it has undergone chemical changes, which sometimes take place entirely within the very cell through the integument of which it has entered, some of the lowest kinds of plants consisting altogether only of a single cell; but which, in other plants of higher and more complex organization, depend upon a Circulation of the Sap (q. v.), and a very various action of many different organs, each formed of a multitude of cells. These processes are still very imperfectly understood. By them, not only is the plant nourished, but vegetable products of every kind are elaborated, in which, throughout the wide domains of the vegetable kingdom, there is such wonderful variety, and often great diversity in different parts of the same plant.

Whatever the source from which plants derive their nutriment, no organic substance is appropriated by them; but in order to their use, it must first undergo decomposition. Their food consists wholly of inorganic matter, and the value of organic substances as manures depends not only on the abundance which they contain of the proper elements, but of the readiness with which they undergo

decomposition so as to present these elements in the most suitable form; which is not, however, as elements uncombined, but in various combinations with each other. Thus carbon and oxygen enter plants together in the form of carbonic acid, oxygen and hydrogen together in the form of water, hydrogen and nitrogen in the form of ammonia. Carbonic acid absorbed by the leaves from the air is decomposed within the plant, under the influence of light, and particularly of the direct rays of the sun, and its carbon enters into new combinations to form vegetable substances, whilst its oxygen is exhaled again into the atmosphere, which is thus maintained in a state fit for the support both of vegetable and animal life by the opposite and balanced action of animals and plants. Of the elements which enter into the composition of vegetable substances, Carbon is the most abundant; and, along with it, Oxygen, Hydrogen, and Nitrogen constitute the chief part of every plant. Other elements, both metallic and non-metallic, are found in comparatively small quantity, although some of them are very generally present in plants, as Calcium, Potassium, Sodium, Sulphur, Phosphorus, Silicon, Iron, Aluminium, Magnesium, Chlorine, and Iodine. Among the elements found in plants are also to be enumerated Bromine, Manganese, and Copper, which occur only in minute quantities, and Copper very rarely.

There is no circulation in plants like that of the blood in animals, nor any organ at all analogous to a heart; although there is a constant motion or circulation of their juices, both throughout the whole organism and within individual cells. And although the term *respiration* has been often employed with reference to plants, and particularly to leaves, yet there is not only no action analogous to that of lungs, but no oxygenation of the juices by their being brought into contact with the air; carbonic acid and ammonia—not oxygen—being imbibed from it for nutrition. And there is nothing in the vegetable kingdom having the slightest resemblance to a brain or a nervous system. In the possession of sexual organs, however, there is a wonderful agreement, where it might least have been expected, between plants—or at least all phanerogamous plants—and animals. As to this and other important points concerning the life of plants, see *VEGETABLE PHYSIOLOGY*. See also the article *FLOWER*, and those on the different organs of which the flower is made up; the articles *FRUIT*, *SEED*, *SPORE*; *CELLS*, *CELLULAR TISSUE*, *VASCULAR TISSUE*; *METAMORPHOSIS OF ORGANS*; *LEAVES*, *STEM*, &c. The great divisions of the vegetable kingdom are noticed in the article *BOTANY*, in connection with the subject of classification, and in separate articles. The *GEOGRAPHICAL DISTRIBUTION OF PLANTS*, and the *DISEASES OF PLANTS*, are noticed under these heads.

Besides the relations of the animal and vegetable kingdoms already noticed in this article, in their joint and balanced action, keeping the constitution of the atmosphere such as is fit both for animal and vegetable life, reference may be here made, in conclusion, to similar relations subsisting in plants and animals as to temperature and as to their mutually providing food for one another. 'It would almost seem as if plants possessed a power of producing cold analogous to that exhibited by animals in producing heat, and of this beneficent arrangement man enjoys the benefit in the luxurious coolness of the fruit which nature lavishes on the tropics' (Sir J. E. Tennent). Flowers indeed produce heat; but the juices of plants are colder than the soil or surrounding atmosphere during the time of active vegetation; and the coolness of groves is owing not only to shade but to the transpiration of moisture by the innumerable leaves.—*Inorganic*

substances are appropriated by plants, as food, and converted by a 'high and mysterious' chemistry into organic substances of many kinds, many of them suitable food for animals, which feed on organic substances alone. But the excrements of animals again furnish food for plants; and when animals die, their bodies undergo a series of changes by decomposition, which terminate in the production of the substances most suitable for the nourishment of plants. There is, moreover, not only this conversion of the same matter into animal and vegetable substances alternately; but there is also a continual transformation of matter which has remained inorganic throughout long geologic periods into organic substances, and in this some of the lowest kinds of plants are particularly employed, as lichens, which decompose and feed upon the very rocks on which they grow; whilst, on the other hand, the fossil remains of remote periods, and all the products of decomposition, exhibit matter which once formed part of living organisms returned to an inorganic state.

PLANTA'GENET, the surname of the French family of Anjou, which, in 1154, succeeded to the throne of England on the extinction of the Norman dynasty in the male line, and reigned till 1485, when it was supplanted by the family of Tudor (q. v.). The name P. belonged originally to the House of Anjou, and is said by antiquarians to have been derived from the circumstance of the first count of this house having caused himself to be scourged with branches of broom (*planta-genista*), as a penance for some crime he had committed. On the extinction of the male line of the Norman dynasty in the person of Henry I., the crown of England was claimed by Stephen, count of Blois, the son of Henry's sister Adela, or Adeliza, and by Henry's own daughter Matilda ('the Empress Maud'), then the wife of Geoffrey P., Count of Anjou, for her son Henry Plantagenet. Stephen, by favour of the nobles, was the successful competitor, on the condition that Henry should succeed him; and accordingly on Stephen's death, in 1154, the son of Geoffrey P. ascended the throne of England as Henry II. His sons Richard I. and John succeeded him, and the descendants of the latter in the direct male line—viz., Henry III., Edward I., Edward II., Edward III., and (Edward III.'s eldest son, the Black Prince, having died before his father, leaving an only son, who as) Richard II.—succeeded without interruption. The eldest male line now became extinct, and it was necessary to choose the rightful heir to the throne from among the descendants of Edward III.'s other sons. His second son had died without heirs, but Lionel, Duke of Clarence; John of Gaunt, Duke of Lancaster; and Edmund Langley, Duke of York, his third, fourth, and fifth sons respectively, were still represented by legitimate issue. Of these, Edmund Mortimer, Earl of March, and Anne Mortimer, the wife of Richard, Earl of Cambridge (who was the eldest son and heir of Edmund Langley, Duke of York), the lineal descendants of Lionel of Clarence, possessed the prior claim to the throne; but Edmund was put in prison by Henry IV., the eldest son of John of Gaunt, Duke of Lancaster, who usurped the crown in 1399, and transmitted it to his lineal descendants Henry V. and Henry VI. By this time Edmund Mortimer had died without heirs, and the descendants of the marriage of his sister Anne (the heiress of Clarence) with Richard, Earl of Cambridge (the heir of York), uniting the claims of the *third* and *fifth* sons, had, through their maternal ancestress, a superior claim to the throne over Henry VI. the Lancastrian monarch, who only represented the *fourth*

son of Edward III. Richard Duke of York, the son of Richard of Cambridge and Anne Mortimer, attempted to obtain the crown, but he was taken and executed, leaving to his sons the task of avenging his death, and asserting the claims of the combined house of York and Clarence to the throne, in which they were ably assisted by Richard Neville, Earl of Warwick ('the King-maker'). The result was a long and desolating civil war (1455—1485) between the partisans of York and Lancaster, which is known in history as the 'Wars of the Roses' (the Lancastrians having chosen for their emblem a *red* and the Yorkists a *white* rose), in which more than 100,000 persons perished, and many noble families were either extirpated on the field and the scaffold, or completely ruined. During this dreadful contest, in which the Yorkists generally had the advantage, Edward IV. (the eldest son of the Duke of York who had been executed), his son Edward V., and his brother Richard III. (q. v.) successively swayed the sceptre. But Richard's cruel and tyrannical government added new vigour to the reviving Lancastrians, and Henry Tudor (see HENRY VII.), the representative of their claims, defeated the Yorkist tyrant on the field of Bosworth; and then, by his marriage with Elizabeth, the eldest daughter of Edward IV., and the representative of the Yorkist claims, reunited in his family the conflicting pretensions to the throne, which he transmitted in peace to his descendants. See TUDOR; and for the events of this contest, see ROSES, WARS OF THE.

PLANTAGINEÆ, or PLANTAGINA'CEÆ, a natural order of exogenous plants, mostly herbaceous and without stems; the leaves forming rosettes, flat and ribbed, or taper and fleshy; the flowers generally in spikes, and generally hermaphrodite; the calyx 4-parted, persistent; the corolla hypogynous, membranous, persistent, its limb 4-parted; the stamens four, inserted into the

Greater Plantain (*Plantago major*).

corolla, with long filaments; the ovary free, of a single carpel, 1—4-celled; the cells containing one, two, or many ovules; the fruit, a membranous

capsule with a lid. The *testa* of the seeds abounds in mucilage, which is easily extracted by boiling water. The order is allied to *Plumbaginaceæ* and *Primulaceæ*. There are about 120 known species, diffused over all parts of the globe, but most abundant in temperate and cold countries. The most important genus is *Plantago*, the species of which often receive the English name PLANTAIN. Five of this genus are found in the United Kingdom, the chief of which are the following: the GREATER PLANTAIN, or WAYBREAD (*P. major*), one of the most common of British plants; a perennial, with broad ovate stalked leaves and long cylindrical spikes, growing in pastures, waysides, &c. It is very widely diffused over the world. Its seeds are a favourite food of birds, and the gathering of the spikes to feed cage-birds is familiar to every one. The leaves are applied to wounds by the peasantry in many districts. They are said also to be a useful application to ulcers and indolent scrofulous tumours. —The RIBWORT PLANTAIN, or RIBGRASS (*P. lanceolata*), is another very common British plant, forming no small part of the herbage of many meadows and pastures, and sometimes sown by farmers, because its foliage is produced early in the season, and is then acceptable to oxen, sheep, and horses; but deemed most suitable for poor soils, as its spreading leaves occupy too much of the ground, and choke better grasses in rich land. Its leaves are lanceolate, and taper at both ends; its spikes are short, ovate or cylindrical, and placed on long angular stalks. Its seed is acceptable to cage-birds. This is the plant, commonly known as 'bullies,' or 'sodgers,' the striking off the heads (or spikes) of which is such a favourite amusement of children. —The mucilage of the seeds of *Plantago ispaghula* and of *P. psyllium* is much used in India in catarrhs and other complaints; and *P. psyllium*—called FLEAWORT, and its seeds FLEASEED—is cultivated in France for the sake of this mucilage, which is used by paper-stainers in preference to that obtained from linseed, and is also extensively used by muslin manufacturers for stiffening their goods. The plant has a branched spreading stem, and recurved leaves.

PLANTAIN (*Musa Paradisaica*), a most important food-plant of tropical countries, and one of the largest of herbaceous plants, belongs to the natural order *Musaceæ* (q. v.), and is a native of the East Indies, where numberless varieties of it have been cultivated for thousands of years. It is now diffused over all the tropical and subtropical regions of the globe. It must have been carried to America soon after or during the days of Columbus, for its fruit was a principal article of food there in the first half of the 16th c.; but there is nothing to support the conjecture of Humboldt that there may be different species cultivated under the name of P., and some of them natives of America. The P. is now, however, cultivated to the furthest depths of the primeval American forests, accompanies the Indians in their frequent changes of residence, forms the wealth of many occupiers of land in the vicinity of great towns, where large plantations of it are made, and is a true staff of life to the population of all colours and classes in tropical countries. In many regions it is the principal article of food.

In the genus *Musa* there arise from the midst of the leaves—or apparently from the top of the stem, the sheathing bases of the leaves forming a tree-like false stem—stalks which bear great spikes of flowers, each enclosed in a large bract or spathe; the flowers, and afterwards the fruit, are arranged in clusters or almost in whorls on the stalk; the flowers have a perianth of six segments, five of which cohere as a tube slit at the back, and the sixth is small and concave; there are six stamens,

one or more of them imperfect; the germen is inferior, 3-celled, with two rows of ovules in each cell; the fruit is fleshy, and has many seeds imbedded in its pulp. The name *Musa* is from the Arabic *muz*, a plantain; the P. seems to be described by Pliny under the name *pala*, a name probably derived from an eastern root, from which also comes the name *plantain*. The specific name *Paradisaica* alludes either to a fancy that the P. was the forbidden fruit of Eden, or to a legend that the aprons which our first parents made for themselves were of P. leaves.

The stem of the P. is usually 15 or 20 feet high, although there are varieties having a stem of only six feet. The leaves are very large, the blade being sometimes ten feet long and three feet broad, undivided, of a beautiful shining green; the midrib strong and fleshy. The fruit is oblong, varying from its usual long shape to an almost spherical one, obscurely angular, eight inches to a foot long in the varieties commonly known by the name P., of which the fruit is usually cooked or prepared in some way in order to be eaten, and very often forms a substitute for bread; whilst the smaller-fruited varieties, of which the fruit is eaten raw, are generally known by the name Banana (q. v.); these names, however, being somewhat variously used.

The P. is generally propagated by suckers; and a sucker attains maturity in about eight months or a year after being planted. The stem is cut down after fruiting, but the plantation does not require renewal for 15 or 20 years. Plantains ought to be at least ten feet apart in plantations of them, or six feet in single rows around fields or gardens. The P. has been sometimes cultivated with success in hothouses.

With the exception of two or three palms, it would not be easy to name, in the whole vegetable kingdom, any plant which is applied to a greater number of uses than the plantain. The fruit is sometimes eaten raw, although more generally—except that of the banana—boiled or roasted, and variously prepared. It is both farinaceous and saccharine. In most of the varieties it has a sweetish taste; in some it is mealy; and in some it is sub-acid or austere. It is as much used before being perfectly ripe as when it is so. In the West Indies the P. boiled and beaten in a mortar is a common food of the negroes. Plantains baked in their skins, or fried in slices with butter and powdered over with sugar, are favourite dishes in some tropical countries. They are preserved by drying in the sun or in ovens, and pressed into masses, in which state they keep for years, and furnish a wholesome article of food. The unripe fruit, peeled, sliced, dried, and powdered, is called *P. meal*, and in Guiana *Conquin-tay*; it is whitish with dark-red specks, a fragrance like orris-root, and a taste like wheat-flour; and is made into excellent and nourishing dishes. A good and wholesome starch is obtained from the P. by rasping and washing.—A decoction of the fruit is a common beverage; and a kind of wine is obtained from it by fermentation.—The top of the stalk is a good boiled vegetable.—The leaves are much used for packing, and many other purposes; the fibre of their stalks is used for textile purposes and for cordage; and it is probable that it might be used for paper-making; but hitherto the leaves and stems of plantains have been generally burned or left to rot.

So great is the food produce of the P., that, according to Humboldt's calculation, it is to that of the potato as 44 to 1, and to that of wheat as 133 to 1. The P. requires little attention.

The name P. is frequently extended to the whole genus *Musa*. Wild species, with austere fruit.

are found in many parts of the East. One ascends the Himalayas to an elevation of 6500 feet. A species found in the South Sea Islands (*M. troglodytarum*) is remarkable for bearing its clusters of fruit erect, not pendent like the other species. Its fruit is eatable, as is that of *M. Cavendishii* and of *M. Chinensis*, species or varieties smaller than the common plantain.—The *Musa* which is extensively cultivated in the Philippine Islands for its fibre, *Abaca* or *Manilla Hemp*, is very similar to the common P., but has a green, hard, and austere fruit. It is generally cut when about a year and a half old, before flowering. The outer layers of the stem yield the coarsest fibre; that of the inner is so fine that a garment made of it may be enclosed in the hollow of the hand.—The young stems of *M. Ensete*, the *ENSETE* of Abyssinia, are used in that country as a boiled esculent.

PLANTAIN-EATER (*Musophaga*), a genus of birds of the family *Musophagide*, to the whole of which the same English name is often extended. The *Musophagide* are tropical birds, African and South American, of the order *Insectores*, and tribe *Contirostres*, allied to finches, but many of them large, and more like gallinaceous birds than finches. They are birds of beautiful plumage. They have strong thick bills, more or less curved on the top, the cutting edges jagged or finely serrated, so as to render them very efficient instruments for cutting soft vegetable substances, on which they feed, as the plantain and other fruits, and for dividing the succulent stems of plants, which they cut off close to the ground. They live much among the boughs of trees, and are active and wary birds. The true plantain-eaters (*Musophaga*) have the base of the bill extending upon the forehead; the *TOURACOS* (*Corythaix*) have a smaller bill, and the head crested.

PLANTATION, a term sometimes applied to places where timber trees have been planted. In that sense, as a general rule, whoever is the owner of the soil, is entitled to the trees which are planted in such soil. When land is let by lease to a tenant, the tenant does not become the owner of the trees, and cannot cut them down. But he is in England and Ireland entitled to reasonable estovers; that is, to cut sufficient wood to repair or build the houses, or make implements of husbandry. The common law of England was very defective in protecting plantations, for it was held that, as the trees were part of the realty, or soil, and nobody could steal the soil, hence nobody could be punished for larceny of trees. But this defect was cured by statute. Whoever cuts, breaks, roots up, or otherwise destroys or damages, with intent to steal, the whole or any part of a tree, sapling, or shrub, if the damage is of the amount of one shilling, may be convicted summarily, before justices of the peace, and fined £5; for a second offence, he may be committed to the house of correction for twelve months or less; and for a third offence, he is guilty of felony, and may be punished as for larceny. So, whoever steals or damages a live fence, may be fined by justices a sum of £5; and for a second offence, may be committed to the house of correction for twelve months. Moreover, if any person is found in possession of a piece of a tree or live fence, and do not give a proper account of his coming into lawful possession of the same, he may be fined £2.—In Scotland, various acts of the Scotch parliament were directed against offences of damaging trees, which are punishable as malicious mischief; the penalty being £10 Scots for each tree less than ten years old, and £20 Scots for each older tree. Tenants may also be fined for such offences. In case of injuries to fences, old Scotch statutes also provide a punishment.

PLANTATION AND PLANTING OF TREES. See ARBORICULTURE.

PLANTIGRADA, in Cuvier's zoological system, a tribe of *Carnivora* (q. v.), characterised by placing the whole sole of the foot on the ground in walking. The sole is generally destitute of hair. Both fore and hind feet are five-toed in all the plantigrada. The P. are generally more or less nocturnal in their mode of life, and their movements are slower and their gait more clumsy than those of the *Digitigrada*. They are also, in general, less carnivorous; many of them feed in part or occasionally on vegetable food. The conformation of their limbs and feet gives them a power of standing erect on their hind-feet, which none of the *Digitigrada* possess, and of which advantage is taken in tame bears for the amusement of spectators.

Plantigrade Foot.

PLANTIN, CHRISTOPHE, an eminent printer, was born at St Avertin, near Tours, in 1514, and set up a printing-establishment at Antwerp in 1550, which soon became the greatest and most celebrated of the time. He had often twenty presses or more in active operation. Guicciardini mentions his printing-establishment as the finest ornament of the city of Antwerp, and as one of the wonders of Europe, and the learned agreed in regarding him as the first printer of his time, although he was the contemporary of Aldus and Estienne (Stephens); but this is true only as regards the number of works which issued from his establishment, and the beauty of their typography; for the services which the others have rendered to classic literature are far beyond those of Plantin. P. was nevertheless himself a man of varied, though probably not very profound learning. He superintended the publication of works in several languages, and was extremely careful of their accuracy, employing able and learned correctors of the press, whom he remunerated liberally, and publicly offering rewards for the discovery of errors. The most noted of all his publications is the *Biblia Polyglotta* (8 vols. 1569—1572), which was printed under the personal superintendence of Arias Montanus, the court chaplain of Philip II. of Spain, and towards which, Philip gave 6000 ducats for the purchase of paper. But the oldest book known to have proceeded from the press of P. is the *Institution d'une Fille de Noble Maison, traduite de Langue Toscane en François*, by Jean Beller (Ant. 1555). P. died at Antwerp in 1589. He had set up printing-establishments in Leyden and Paris, and these, with that in Antwerp, were carried on by the husbands of his three daughters.

PLANTS, in point of law, when put in a garden or other ground let to a tenant, belong to the landlord, and not to the tenant, for they become part of the soil. Hence, a tenant cannot dig them up and remove them, at the termination of his lease. This right of the landlord, however, is seldom enforced with much strictness, partly because the tenant may alter and remove the plants at discretion during his lease, and thus can evade the rule of law. In the case of nursery-grounds, however, the above rule does not apply, as between landlord and tenant, for the plants are considered the stock-in-trade of the nurseryman, who puts them in the ground, not with a view to let them grow permanently, but as a convenient mode of keeping them for sale. Hence, at the termination of his lease, the tenant can remove them all.

PLANUDES, MAXIMUS. See ANTHOLOGY.

PLASEN'CIA, an ancient and much-decayed, but most picturesque town of Spain, in Estremadura, 43 miles north-north-east of Cáceres, stands on a steep hill, with beautiful and fertile valleys, extending on the north-west and south-east sides. It is almost wholly girdled by the clear waters of the Jerte; and the surrounding scenery, embracing city, castle, river, rock, and mountain, and over-arched by a sunny and unclouded sky, is remarkably beautiful. The city contains the picturesque remains of an ancient castle, and is surrounded by crumbling walls, surmounted by 68 towers, and pierced by six gates. Water is brought to the town by an aqueduct of 80 arches. There are seven Gothic churches, an episcopal and several other palaces, and the cathedral, an ornate Gothic edifice, begun in 1498, and some portions of which are still unfinished, while others have been altered and disfigured. The cathedral contains many noble tombs, with effigies. P., once a flourishing and important city, was founded in 1190. It now carries on some minor manufactures of cotton, woollen, and hempen fabrics, and of hats and leather. Pop. about 6000.

PLASMA, a silicious mineral, a variety of quartz or chalcedony, of a bright-green colour, black when polished, and seen by reflected light, but very translucent when held between the eye and the light. It is very nearly allied to heliotrope or bloodstone, but has no red spots, is more translucent, and is not susceptible of so brilliant a polish. It is never found crystallised. It is a rare mineral, and the finest specimens are brought from India and China. It was highly prized by the ancient Romans, who wrought it into ornaments of various kinds; and very fine engraved specimens have been found among the ruins of ancient Rome. The ancients are said to have obtained their plasma from Mount Olympus, in Asia Minor. The name plasma is supposed to be identical with the Greek *prason*, a leek, the *r* having passed into *l*.

PLASTER OF PARIS. See GYPSUM.

PLASTERING, the art of covering walls, partitions, ceilings, &c., with a composition of lime mixed with sand and hair. It is usually done in three coats. The first coat is the solid foundation on which the rest is placed; it is therefore of a good thickness, and is hatched or crossed with lines, so as to give a bond for the next coat. The first coat is allowed to dry thoroughly; then the second coat is floated over the first, and rubbed well in with a flat board, about 12 inches square, so as to bring it all to a fair and equal surface (in Scotland this is called the 'straightening'); and before the second coat has thoroughly dried, the third or finishing coat is applied in finer materials, and in a more liquid state. In the case of ceiling cornices, mouldings, &c., plaster of Paris or stucco is generally used. This sets or hardens more rapidly than lime, and has a finer and whiter surface.

Ornaments (called enrichments) are generally composed of plaster of Paris, and cast in moulds. They are then set in their places after the cornice has been made, or run.

PLASTERS are a class of medicinal agents which are employed externally with various objects. They are solid and tenacious compounds, adhesive at the ordinary temperature of the body, and owing their consistency—1. To the chemical combination of oxide of lead, with one or more fatty acids; or 2, to a due admixture of wax, or fat, and resin; or 3, to the chemical action of the component parts of the plaster on each other. Strictly speaking, the term *Plaster* should be restricted to the

first class of compounds; viz., to combination of oxide of lead with fatty acids. In the British Pharmacopœia, there are directions for making 12 plasters, viz., ammoniac and mercury plaster, Belladonna plaster, cantharides plaster, chalybeate plaster, galbanum plaster, litharge (or lead) plaster, mercurial plaster, opium plaster, pitch plaster, resin plaster, soap plaster, and warm plaster. The litharge (or lead) plaster, directly or indirectly, enters into the composition of all the twelve official plasters, excepting those of ammoniac and mercury, cantharides, and pitch. *Lead Plaster*, which is usually sold under the name of *Diachylon*, in combination with resin, constitutes the ordinary adhesive plaster. The best plaster of this kind for strapping is composed of a mixture of six drachms of resin with a pound of lead plaster. The *cantharides plaster* and the *ammoniac and mercury plaster*, are examples of the second and third varieties.

Plasters are generally kept in rolls; and when they are to be used, they are melted at a temperature of not more than 212°, and spread on soft leather. They are employed to answer two distinct indications, namely, to act *mechanically*, as by affording artificial support to weak muscular structures, by preventing threatened or tedious excoriations, by protecting parts already excoriated from the action of the air, &c.; and to act *medicinally* as stimulant, discutient, alterative, anodyne, &c.

PLATA, LA. See ARGENTINE REPUBLIC.

PLATA, RIO DE LA, a wide estuary of South America, between Uruguay on the north and the Argentine Confederation on the south, forms the mouth of the Parana (q. v.) and the Uruguay (q. v.). It is 180 miles long, 29 miles broad at Buenos Ayres, and 130 miles broad at its mouth, between Punta Negra and Cape San Antonio. At its mouth it is, on an average, only about 10 fathoms deep; at Monte Video it is only 3 fathoms; and at Buenos Ayres about 16 feet deep. Some conception of the vast volume of water which this estuary carries to the Atlantic may be had when it is remembered that with its affluents it drains an area of 1,250,000 square miles. The strong and irregular currents, and the sudden tempests of the La P., render its navigation extremely dangerous. It is estimated that through this estuary about one-fourth of the produce of South America is brought to market. For the navigation of its affluents, see PARAGUAY, PARANA, and URUGUAY.

PLATÆA, or PLATÆÆ, a city in the western part of Bœotia, on the borders of Attica, and at the foot of Mount Cithæron. It was about 6½ miles from Thebes. In 480 B.C., it was destroyed by the Persians, because the inhabitants had taken part with Athens in the battle of Marathon; but in the following year, it was the scene of the glorious victory won by the Lacedæmonian Greeks, under Pausanias and Aristides, over the Persian hordes commanded by Mardonius—a victory that finally delivered Greece from the threatened yoke of the invader. In the third year of the Peloponnesian war (429 B.C.), it was attacked by a Theban-Lacedæmonian force—for the Plateans were firm friends of Athens—and heroically defended itself for more than two years, until it was starved into surrender. The little garrison of about 200 men were put to the sword, and the city was razed to the ground. Such of the Plateans as escaped were hospitably received at Athens. By the treaty of Antalcidas (387 B.C.), their children were allowed to go back again, and rebuild their city, after an exile of 40 years; but they were again driven out by their implacable enemies, the Thebans; and half a century elapsed before the victory of Philip of

Macedon at Chæroneia enabled the Plataeans to finally return to their homes. After this, the city remained inhabited, probably till the latest days of the empire. It is mentioned in the 6th c. A. D. Some ruins of P. are still visible near the village of *Kokhla*.

PLATA'LEA. See **SPOONBILL**.

PLAT-BAND, in Architecture, a flat fascia or band, with less projection than breadth.

PLATE, in Heraldry, a Roundel (q. v.) argent. It is represented flat, and in the heraldry of Scotland is known as a *Bezant argent*.

PLATE-MARKS are legal impressions made on articles of gold or silver at the various assay offices, for the purpose of indicating the true value of the metal of which the articles are made. The marks are a series of symbols, which are embossed in a line of about three-quarters of an inch in length, and usually on every separate piece of which an article is composed. These symbols are—1. The maker's own mark or initials. 2. The standard or assay mark; viz., for gold, a crown, and figures denoting the number of carats fine. This means that pure gold is reckoned at 24 carats, and every part of alloy added reduces that standard number (see **CARAT**); so that if a piece of gold-plate or jewellery is marked with a crown and 18, it indicates that it consists of 18 parts of pure gold, and 6 parts of some other metal alloyed with it. Gold of eight carats is now legal, but as it is marked by the assay office, there can be no deception, if the public understand the plate-marks. If not, they may pay for pure gold, relying upon the hall-mark, when in reality they only receive a third part gold. *For Silver*—England, a lion passant; Ireland, a harp crowned; Edinburgh, a thistle; Glasgow, a lion rampant. 3. The hall-mark of the district office—London, a leopard's head crowned; York, three lions and a cross; Exeter, a castle with two wings; Chester, three wheat-sheaves or a dagger; Newcastle, three castles; Birmingham, an anchor; Sheffield, a crown; Edinburgh, a castle and lion; Glasgow, a tree, salmon, and ring; Dublin, the figure of Hibernia. 4. The duty-mark, indicating the payment of duty, viz., the head of the reigning sovereign. 5. The date-mark. Each office has its alphabetical mark, indicating the date of the stamp. In London, the assay year commences on the 30th of May, and the date of the current year is indicated by one of the first twenty letters of the alphabet used in regular succession; thus, the Goldsmiths' Company of London have used the following marks:

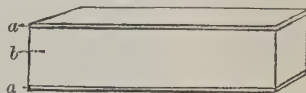

From 1716 to 1755,	Roman Capital Letters.
" 1756 " 1775,	Roman Small Letters.
" 1776 " 1795,	Old English Letters.
" 1796 " 1815,	Roman Capital Letters A to U.
" 1816 " 1835,	Small Roman Letters a to u.
" 1836 " 1855,	Old English Letters A to A.
" 1856 "	Small Black Letters a to z.

Thus, **E S A Q I** would represent the mark on Elkington's plate, made in the year 1864.

PLATE-POWDER, a composition used for cleaning gold and silver plate and plated articles. It is also called Rouge-powder (see **ROUGE**). It is made by levigating rouge with three times its weight of prepared chalk, until they are thoroughly mixed into an almost impalpable powder. Sometimes Putty-powder (q. v.) is used instead of rouge, and a little rose-pink added to colour it. A plate-powder is also sometimes made by levigating quicksilver with twelve times its weight of prepared chalk, until it is thoroughly incorporated, and forms a gray powder. It puts a

remarkable brilliancy on silver-plate, but is very injurious to it.

PLATING signifies the covering of an inferior metal with one of the precious metals, the object being to give the appearance of silver or gold to articles chiefly intended for table use. At present, the articles are generally made of German silver, or some of the similar white-metal alloys; but formerly, copper, or an alloy of that metal with brass, was used; the disadvantage of which was that, as the coating of silver wore off, the red colour of the copper became disagreeably apparent through the thin covering of silver. Gold is rarely plated on any other metal than silver, except for purposes of deception. Previous to the introduction of electroplating, the method generally pursued was that which has acquired the name of *Sheffield-plating*, from the large extent to which it was carried on in that town. It consists in soldering on to one or both sides of an ingot of the baser metal, a thin plate of silver. The ingot is always of an oblong shape, and is most carefully prepared on the surfaces which are to receive the silver, so that nothing shall prevent the complete union of the two. The shape and relative proportion of the ingot, and its

plating of silver, are seen in the figure: *aa* is the silver on the upper and lower surfaces, for double-plated goods; *b*, the body of the ingot, of copper or white-metal alloy. The soldering is a process requiring much care and nicety: the plates of silver are thinly coated with a concentrated solution of borax, and are then applied to the prepared surfaces of the ingot, to which they are firmly bound with iron wire, and then placed in the *plating-furnace*, and subjected to a strong heat. This furnace is so arranged that the interior can be constantly watched, and when the proper temperature is attained, the workman knows the exact instant to withdraw it. The act of soldering is almost instantaneous, and fusion would immediately follow, if the ingot was not quickly withdrawn. When cooled, the wire is taken off, and the ingot is taken to the rolling-mill, where it is passed backwards and forwards, of course with the silver above and below, until it is rolled out into a sheet of the exact thickness required. However thin it may be made, it is found that the relative thickness between the ingot and its layers of silver is always the same. As usual in all cases of rolling or striking metal, annealing from time to time is necessary, to remove the brittleness which these operations cause.

This method does not admit of the manufacture of any portions such as ornamental moulded borders, &c.; these had therefore to be formed separately of copper, and were coated by the process called *Silvering* (q. v.). Now, however, it is found better to make them of silver rolled thin, and fill them inside with lead, to give them solidity; by this plan is avoided the annoyance of the silver rubbing off, and exposing the copper. Sheffield-plating is still made extensively, but the manufacture is rapidly declining in presence of the newer art of electro-plating. See **GALVANISM**.

Within a very recent period, and since the subject of electro-plating was treated under the article **GALVANISM**, some very remarkable applications of the process have been discovered; for instance, it is no longer confined to the deposit of silver and gold; aluminium, silicium, titanium, tungsten, molybdenum, tin, cadmium, lead, bismuth, palladium, rhodium, iridium, and the alloys

PLATINUM.

brass and bronze and zinc, are all now deposited under patent processes. Of all these, by far the most important is the deposit of the alloys, and a very large trade has sprung up in manufactures of iron coated with brass and zinc. The importance of being able to cover a metal so cheap yet so easily corroded as cast iron, with so ornamental an alloy as brass or bronze, can hardly be overrated. Many extensive and satisfactory pieces of this work have already been made.

PLATINUM (symb. Pt, equiv. 197.4, sp. gr. 21.5) is one of the 'noble metals,' which may be obtained in more forms than one. It is only found in the native state, usually occurring in small glistening granules of a steel-gray colour, which always contains an admixture, in varying proportions, of several metals, most of which are rarely found except in association with platinum. Sometimes, however, it occurs in masses of the size of a pigeon's egg, and pieces weighing ten or even twenty pounds have occasionally been found. The following table shews the composition of crude platinum ore as obtained from different parts of the globe. The analyses are by Messrs. Deville and Debray, and that from Oregon by C. A. Kurlbaum, Jr.

	Colum- bus.	Calif. ornia.	Ore- gon.	Spain.	Aus- tralia.	Russia.
Platinum, . . .	80.00	79.85	43.54	45.70	59.80	77.50
Iridium, . . .	1.55	4.20	0.60	0.95	2.20	1.45
Rhodium, . . .	2.50	0.65	0.28	2.65	1.50	2.80
Palladium, . . .	1.00	1.95	0.49	0.85	1.50	0.85
Gold, . . .	1.50	0.55	1.32	3.15	2.40	...
Copper, . . .	0.65	0.75	0.32	1.05	1.10	2.15
Iron, . . .	7.20	4.45	4.62	6.80	4.30	9.60
Osmide of Iridium, . . .	1.40	4.95	48.77	2.85	25.00	2.35
Sand, . . .	4.35	2.60	...	35.95	1.20	1.00
Osmium and loss,	0.05	...	0.05	0.80	2.30

Rhuthenium is also almost always present, and in the above analyses is probably included with the iridium, which it closely resembles.

There are two modes of obtaining platinum in the form of ingots from the ore, both of which require notice. The method which has been universally employed, till within the last ten years, was that discovered by Wollaston, the leading steps of which were as follows: After the removal of the metals associated with the platinum, by the successive action of nitric and hydrochloric acids, the platinum itself is dissolved in aqua regia, from which it is precipitated by a solution of sal ammoniac in the form of a sparingly soluble double salt, the chloroplatinate of ammonium, represented by the formula $(\text{NH}_4)_2\text{PtCl}_6$. This salt is washed and heated to redness, by which means the chlorine and ammonia are expelled, leaving the metal in the form of a gray, spongy, soft mass, known to chemists as *spongy platinum*. In this form, it is very finely powdered under water, is next shaped by intense pressure into a mass, and is then exposed to an intense heat in a wind-furnace, the ingot being formed by hammering it upon its two ends. (If hammered on its sides, it splits.) This heating and forging must be repeated till the metal becomes homogeneous and ductile.

Deville and Debray have introduced an entirely new method for the extraction of platinum from its ores. They first form a fusible alloy of this metal with lead, by exposing the platinum ore—2 cwt. being used in a single experiment, with equal weights of galena and litharge gradually added, and a little glass to act as a flux—to full redness in a reverberatory furnace lined with clay. The sulphur of the galena is oxidised and expelled, and the liquid alloy of lead and platinum is allowed to rest for some time, to allow the osmide of iridium, which is not affected by the preceding operations, to sink to the bottom. The upper

portions of the alloy are then decanted, and cast into ingot-moulds, which are submitted to cupellation; and the metallic platinum which is left after the cupellation is melted and refined in a furnace of lime—which is employed in consequence of its being a very bad conductor of heat—by means of the oxyhydrogen blow-pipe. The platinum obtained in this manner is nearly pure, and very ductile and malleable. For details regarding this process, which has been patented both in France and in this country, the reader is referred to the memoir, 'On Platinum and the Metals which accompany it,' in the *Annales de Chimie et de Physique* for August 1859.

Platinum, as obtained by either of the above processes, exhibits a bluish-white metallic lustre; it is exceedingly malleable and ductile, and is very infusible, melting only before the oxyhydrogen blow-pipe, or in a very powerful blast-furnace, such as that used by Deville and Debray. It expands less by heat than any other metal, and it is usually regarded as the heaviest form of matter yet known; but, according to Deville and Debray, osmium and iridium are about equally dense. It is unaffected by atmospheric action, and does not undergo oxidation in the air at even the highest temperatures. It is not acted on by nitric, hydrochloric, sulphuric, or hydrofluoric acid, or in short, by any single acid; but in aqua regia it slowly dissolves, and forms a soluble bichloride. In consequence of its power of resisting the action of acids, it is of great service in experimental and manufacturing chemical processes, platinum spatulas, capsules, crucibles, &c., being employed in every laboratory; while platinum stills, weighing sometimes as much as one thousand ounces, are frequently used for concentrating oil of vitriol. Platinum is, however, corroded if heated with the alkalies or alkaline earths, and especially with a mixture of nitrate of potash and hydrated potash, an oxide being formed which combines with the alkaline bases.

The form of the metal known as *spongy platinum* has been already noticed. The metal may, however, be obtained in a state of subdivision much finer than that in which it is left on heating the double chloride of platinum and ammonium—namely, in the state known as *Platinum Black*. In this form it resembles soot. It may be prepared in various ways, of which one of the simplest is to boil a solution of bichloride of platinum, to which an excess of carbonate of soda and a quantity of sugar have been added, until the precipitate formed after a little time becomes perfectly black, and the supernatant liquid colourless. The black powder is then collected on a filter, washed, and dried by a gentle heat. In its finely comminuted state, either as spongy platinum or platinum black, it possesses a remarkable power of condensing and absorbing gases, one volume of platinum black being able to absorb more than 100 volumes of oxygen. The absorption appears to be accompanied by a conversion of some or all of the oxygen into the modification known as Ozone (q. v.), since the metal becomes capable of exerting the most energetic oxidising action, even at ordinary temperatures. For example, it can cause the combustion of a jet of hydrogen, can oxidise sulphurous acid into sulphuric acid, ammonia into nitric acid, and alcohol into acetic acid, the rise of temperature in the last case being often sufficiently great to cause inflammation. Platinum in the compact form, as foil or wire, possesses similar powers, but in a far lower degree.

Platinum may be easily alloyed with most of the metals, the alloys being in general much more fusible than pure platinum. Hence care must be taken not to heat the oxides of metals of easy reduction, such as lead and bismuth, in platinum

crucibles, as, if any reduction took place, the crucible would be destroyed by the fusion of the resulting alloy. An alloy of platinum, iridium, and rhodium is found, by the investigations of Deville and Debray, to be harder and capable of resisting a higher temperature than the pure metal; and hence is admirably adapted for the formation of crucibles, &c.

There are two *oxides* of platinum, the platinous, Pt_2O , and the platinum, Pt_2O_3 , neither of which can be formed by the direct union of the elements. Excepting that the change which platinum vessels undergo when containing the caustic alkalies, &c., and exposed to a red heat, is due to the formation of a superficial layer of oxide (probably platinic), these compounds are of little interest. The *sulphides* and *chlorides* correspond in number and composition to the oxides. Of these compounds, the tetrachloride (Pt_2Cl_4) alone requires notice. It is formed by dissolving platinum in aqua regia, and evaporating the solution to dryness; and it is obtained as a deliquescent, reddish-brown mass, which forms an orange-coloured solution in water, from which, on evaporation, it crystallizes in prisms. It is also freely soluble in alcohol and ether. A solution of this salt is much used for the recognition and determination of potash and ammonia.

Platinum has long been used in the form of crucibles in the analytical laboratory, but has recently been employed in the arts on a large scale. Stills for the concentrating sulphuric acid have been made capable of producing eight tons per day, and valued at \$2500. Iridio-platinum has been employed for vents for Whitworth guns.

PLATO, who, along with Aristotle, represents to modern Europe the whole compass of Greek speculation, was born at Athens in the year 429 B.C., shortly after the commencement of the Peloponnesian war, and the same year in which Pericles died. He was of a good family—being connected, on the mother's side, with Solon; and on the father's side, with Codrus, one of the ancient kings of Athens. He received a good education, according to the common practice of the Greeks, in music, gymnastics, and literature. His rich and gorgeous imagination is said at first to have essayed its powers in poetry; but when about 20 years of age, having become acquainted with Socrates, he threw all his verses into the fire, and consecrated his great intellect to philosophy. When he was 20 years old, the political troubles, of which the death of Socrates was only one terrible symptom, forced him to leave Athens for a season, and he resided at Megara, with Euclid, the founder of the Megaric sect. The disturbed state of his native country, doubtless, also was one cause of the frequent travels which he is reported to have made. Of these, his three visits to Sicily, during the time of the elder and younger Dionysius, are the most celebrated and the best authenticated. That he visited Italy, is extremely probable; at all events, he was most closely connected with Archytas and the Pythagorean philosophers; though, as Aristotle (*Metaph.* i. 6) justly remarks, he borrowed from Heraclitus as well as from Pythagoras, and put a stamp of freshness and originality on all that he borrowed. After returning from his first visit to Sicily, being then in his fortieth year, he commenced teaching philosophy publicly, in the *Academeia*, a pleasant garden in the most beautiful suburb of Athens, and there gathered around him a large school of distinguished followers, who maintained a regular succession after his death, under the name of the Philosophers of the Academy. He lived to the age of 82; was never married; and must have possessed some independent property, as he expresses himself

strongly against teaching philosophy for fees, and we nowhere read of his having held any public office from which he could have derived emolument. Such are the few reliable facts known as to the life of Plato.

The principles of his philosophy are happily better known; for all his great works have been preserved, and have always been extensively read wherever the Greek language was known. The only danger to which the students of his philosophy have been exposed is the confusion of the doctrines distinctly taught by him with the exaggeration of these as afterwards worked out by the Neo-Platonists of Alexandria; but this is a danger which the exact critical scholarship of modern times has put out of the way for all persons who exercise common precaution in the acquisition of knowledge. The distinctive character of the Platonic philosophy is expressed by the word *idealism*, as opposed to *realism*, *materialism*, or *sensationalism*, using these words in their most general and least technical sense, the capacity of forming and using ideas being taken as an essential virtue or quality of mind, as contrasted with matter; of thought as contrasted with sensation; of the internal forces of individuals and of the universe, as contrasted with the external forms by which these forces are manifested. As such, the ideal philosophy stands generally opposed to that kind of mental action which draws its stores principally from without, and is not strongly determined to mould the materials thus received by any type of thought or hue of emotion derived from within. In other words, the philosophy of P. is essentially a poetical and an artistical philosophy; for poetry, painting, and music all grow out of idealism, or those lofty inborn conceptions by which genius is distinguished from talent. It is also, at the same time, a scientific philosophy, for the purest science, as mathematics—on which P. is well known to have placed the highest value—is a science of mere ideas or forms conditioned by the intellect which deduces their laws; and, above all, it is essentially a moral and a theological philosophy, for practice, or action, is the highest aim of man, and morality is the ideal of action; and God, as cause of all, is the ideal of ideals, the supreme power, virtue, and excellence to which all contemplation recurs, and from which all action and original energy proceed. The distinctive excellence of the Platonic philosophy is identical with its distinctive character, and consists in that grand union of abstract thought, imaginative decoration, emotional purity, and noble activity, which is the model of a complete and richly endowed humanity. The poetical element in P., so wonderfully combined with the analytical, shews itself not only in those gorgeous myths which form the peroration of some of his profoundest dialogues, but in that very dialogic form itself, of which the situation is often extremely dramatic; though this form of philosophic discussion perhaps owes its existence more to the lively temper and out-of-door habits of the Greeks, than to the special dramatic talent of Plato. On the other hand, the defects of the Platonic philosophy arise from its essential one-sidedness, as a polemical assertion of the rights of thought against the claims of the mere sense, of the stability of the eternal type against the constant change that characterises the ephemeral form. In his zeal to submit all that is external to the imperatorial power of internal conception, the philosopher of ideas is apt to forget the obstinate and unpliant nature of that external world which he would regulate, and after projecting a grand new scheme of society, according to what appears a perfect model, shews like the architect who, after drawing out the model of a

ble temple, finds he has only bricks to build it with. For this reason, extremely practical men, and those who are compelled to reason chiefly by an extensive induction from external facts, have ever felt an instinctive aversion to the Platonic philosophy; and P. himself, by some of the strange and startling conclusions, in matters of social science, to which his ideal philosophy led, has, it must be confessed, put into the hands of his adversaries the most efficient weapons by which his ideal system may be combated.

The starting-point of the Platonic philosophy, as, indeed, it must be of all philosophy, properly so called, is the theory of knowledge. This is set forth in the *Theætetus*, the *Sophistes*, and the *Parmenides*; and in the *Cratylus*, the foundations are laid for a science of language, as the necessary product of a creature energising by ideas. The Platonic theory of knowledge, as developed in the *Theætetus*, will be most readily understood by imagining the very reverse of that which is vulgarly attributed to Locke; viz., by drawing a strong and well-marked line between the province of thought and that of sensation in the production of ideas, and taking care that, in the process of forming conceptions, the mind shall always stand out as the dominant factor. In other words, the hackneyed simile of the sheet of blank paper, applied to the mind by extreme sensational philosophers, must either be thrown away altogether or inverted; the more active part of the operation must always be assigned to the mind. The formation of knowledge, according to P., may be looked on as the gradual and systematic elimination of the accidental and fleeting in the phenomenon from the necessary and permanent; and the process by which the mind performs this elimination—and it can be performed only by mind—is called *Dialectics*. This word, from *dialegomai*, originally signifies only conversational discussion; thence, that discussion conducted in such scientific fashion as to lead to reliable results, i.e., strictly logical. The product of dialectics is ideas, and these ideas being the *eidè*, forms or types of things which are common to all the individuals of a species, all the species of a genus, all the genera of a family, and all the families of a class, generate classification—that is, knowledge of the permanent in phenomena—and definition, which is merely the articulate verbal expression of this permanency. The construction of the confused results of observation into the orderly array of clear conceptions, by a sort of cross-examination of the phenomena, performed by minds impassioned for truth, is exhibited as the great characteristic of the teaching of Socrates, in the *Memorabilia* of Xenophon. In the dialogues of P., the same purification of the reason, so to speak, from the clouds of indistinct sensuousness, is exhibited on a higher platform, and with more comprehensive results. For between Socrates and P., notwithstanding a deep internal identity, there was this striking difference in outward attitude—that the one used logic as a practical instrument in the hands of a great social missionary and preacher of virtue; while the other used it as the architect of a great intellectual system of the universe, first and chiefly for his own time and his own place, but, as the event has proved, in some fashion also for all times and all places.

We should err greatly, however, if we looked on P. as a man of mere speculation, and a writer of metaphysical books, like certain German professors. Neither P. nor any of the great Greeks looked on their intellectual exercises and recreations as an end in themselves. With them, philosophy did not mean mere knowledge or mere speculation, but it

meant wisdom, and wisdom meant wise action, and wise action meant virtue. The philosophy of P., therefore, with all its transcendental flights, of which we hear so much, was essentially a practical philosophy; all his discussions on the theory of knowledge and the nature of ideas are undertaken mainly that a system of eternal divine types, as the only reliable knowledge, may serve as a foundation for a virtuous life, as the only consistent course of action. Virtue, with Socrates and P., is only practical reason. As in the Proverbs of Solomon, all vice is folly, so in the philosophy of P., the imperial virtue is *phronēsis*—i.e., 'wisdom' or practical 'insight.' The other two great Greek and Platonic virtues—*sōphrosynē*, 'moderation' or 'soundmindedness,' and *dikaïosynē*, 'justice,' or the assigning to every act and every function its proper place—are equally exemplifications of a reasonable order applied to action—such an order as alone and everywhere testifies the presence of mind. The theory of morals as worked out from such principles is, of course, as certain as the necessary laws of the reason which it expresses; and accordingly, the Platonic morality, like the Christian, is of that high order which admits of no compromise with ephemeral prejudice or local usage. The contrast between the low moral standard of local respectability and that which is congruous with the universal laws of pure reason, stands out as strikingly in Plato, as the morality of the Sermon on the Mount in the Gospels does against the morality of the Scribes and Pharisees. Splendid passages to this effect occur in various parts of P.'s writings, particularly in the *Republic* and the *Gorgias*. In perfect harmony with the Platonic theory of noble action, is his doctrine with regard to pure emotion and elevated passion. Love with P. is a transcendental admiration of excellence—an admiration of which the soul is capable by its own high origination and the germs of godlike excellence, which are implanted into it from above. The philosophy of love is set forth with imaginative grandeur in the *Phædrus*, and with rich dramatic variety in the *Banquet*, of which dialogue there is an English translation by Shelley. The philosophy of beauty and the theory of pleasure are set forth with great analytic acuteness in the *Philebus*. With P., the foundation of beauty is a reasonable order, addressed to the imagination through the senses—i.e., symmetry in form, and harmony in sounds, the principles of which are as certain as the laws of logic, mathematics, and morals—all equally necessary products of eternal intellect, acting by the creation and by the comprehension of well-ordered forms, and well-harmonised forces, in rich and various play through the living frame of the universe; and the ultimate ground of this lofty and coherent doctrine of intellectual, moral, and æsthetic harmonies lies with P., where alone it can lie, in the unity of a supreme, reasonable, self-existent intelligence, whom we call God, the fountain of all force, and the creator of all order in the universe; the sum of whose most exalted attributes, and the substantial essence of whose perfection may, as contrasted with our finite and partial aspects of things, be expressed by the simple term *to agathón*—the Good. From this supreme and all-excellent intelligence, human souls are offshoots, emanations, or sparks, in such a fashion, that they partake essentially of the essential nature of the source from which they proceed, and accordingly possess unity as their most characteristic quality, attest their presence everywhere by a unifying force which acts by impressing a type on whatever materials are submitted to it, and is filled with a native joy in the perception of such types, the product of

the same divine principle of unity, wheresoever presented. The undivided unity and unifying force which we call the soul is immortal, being from its nature altogether unaffected by the changes of decay and dissolution to which the complex structure of the material human body is exposed. The doctrine of the immortality of the soul is most fully set forth in the *Phædo*, a dialogue which combines with the abstract philosophical discussion, a graphic narrative of the last hours of Socrates, which, for simple pathos and unaffected dignity, is unsurpassed by any human composition.

The most complete and systematic exhibition of the opinions of P. will be found in the *Republic*, or ideal commonwealth, of which an excellent English translation has been recently made by Davies and Vaughan. The *Republic* is not, as the title would lead us to suppose, a political work, like the *Politics* of Aristotle. It is, as Baron Bunsen well remarked, not so much a state as a church with which this great work has to do; or at least, both a state and a church; and the church is the superior and dominating element. In the *Republic*, accordingly, we find the necessity of virtue to the very idea of social life proved in the first book; then the whole process of a complete moral and scientific education is set forth with such fulness as to throw the strictly political part of the book, including the germs of what is now called political economy, very much into the shade. The principles and government of an ideal moral organism, of which the rulers shall be types of fully developed and perfectly educated men, is the real subject of the *Republic*, which accordingly forms a remarkable contrast to the inductive results of the thoroughly practical work of Aristotle on the same subject. P.'s commonwealth is a theoretical construction of a perfect ideal state of society; Aristotle's is a practical discussion on the best form of political government possible under existing conditions. Of the value of P.'s work, both suggestively in the world of politics, and dogmatically in the region of moral and religious speculation, there can be no doubt; but as a practical treatise on politics, it is vitiated throughout, both by its original scheme, and by an inherent vice in the author's mind, which prevented him from recognising the force of the actual in that degree which necessarily belongs to such a complex art as human government. Of this fault, the author was himself sufficiently conscious, and has accordingly, in another large political treatise, the *Laws*, endeavoured, for practical purposes, to make some sort of compromise between the transcendental scheme of his *Commonwealth* and the conditions of existing society. But however he might modify individual opinions, there was a one-sidedness about P.'s mind, which rendered it impossible for him to struggle successfully with the difficulties of complex practical politics. He was too much possessed with the idea of order, and, moreover, had planted himself with too manifest a polemical attitude against Athenian democracy, to give due weight to the opposite principle of freedom, proved by experience to be so indispensable to every healthy and vigorous political development.

Physical science, in the days of P., stood on no basis sufficiently sure or broad to authorise a philosophy of the material universe with any prospect of success. Nevertheless, in his *Timæus*, the great philosopher of ideas has attempted this; and it is a work which, however valueless in the face of the grand results of modern chemical and kinetical research, will ever be consulted with advantage, as a grand constructive summary of the most important facts and theories of nature, known to the Greeks, before the accurate observations of Aristotle,

and the extended mathematics of the Alexandrian school. The great question as to what matter is, and whence, P. nowhere seems to settle very clearly; but the general tendency of ancient thought was towards a dualism, which recognised the independent existence of a not very tractable element called matter, in which P. seems to have acquiesced.

The works of P. were extensively studied by the Church Fathers, one of whom joyfully recognises, in the great teacher of the Academy, the schoolmaster who, in the fulness of time, was destined to educate the heathen for Christ, as Moses did the Jews. A lofty passion for P. likewise seized the literary circle of the Medici at the period of the revival of letters in Italy. Since that time, the tyrannous sway of Aristotle, characteristic of the middle ages, has always been kept in check by a strong band of enthusiastic Platonists in various parts of Europe. Since the French Revolution particularly, the study of Plato has been pursued with renewed vigour in Germany, France, and England; and many of our distinguished authors, without expressly professing Platonism—as Coleridge, Wordsworth, Mrs Browning, Ruskin, &c.—have formed a strong and a growing party of adherents, who could find no common banner under which they could at once so conveniently and so honourably muster as that of Plato. The amount of learned labour expended on the text of Plato during the present century, has been in proportion; and in this department the names of Bekker, Ast, and Stallbaum stand pre-eminent. Professor Jowett also, in Oxford, has made P. his standard author for many years. Mr Grote, the historian of Greece, published *Plato and the other Companions of Socrates* in 1865. One of the best accounts of the Platonic philosophy in the English language will be found in Archer Butler's *History of Greek Philosophy*, vol. ii. See also a sketch of P. by Dr Joseph Thomas, in his *Universal Dict. of Biography*, Philada., 1870.

PLATOFF, MATVEI IVANOVITCH, COUNT, the Hetman of the Cossacks of the Don, and a Russian cavalry general, was born on the banks of the Don, 6th August 1757, and was descended from an ancient and noble family, which had emigrated from Greece. Having acquired a considerable reputation for valour and bravery, he was appointed by the Czar Alexander I. Hetman of the Cossacks; and subsequently, as a lieutenant-general in the Russian army, and afterwards as commander of the Russian irregular cavalry, he took a prominent part in the wars both with France and Turkey. After the French had evacuated Moscow, and retreated, P. hung upon their rear with the utmost pertinacity, wearying them out by incessant attacks, cutting off straggling parties, capturing their convoys of provisions, and keeping them in a state of continual terror and apprehension. The French historians state that Bonaparte's army suffered more loss from the attacks of P.'s Cossacks than from privation and exhaustion. He defeated Lefebvre at Altenburg. After the rout of the French at Leipzig, he inflicted great loss upon them in their retreat, and subsequently gained a victory over them at Laon. The inhabitants of Seine-et-Marne will long remember him by the devastations and pillage committed by his undisciplined bands. He was enthusiastically welcomed by the Parisians (to their shame), and also by the English, who presented him with a sword of honour on the occasion of his visit to London in company with Marshal Blücher. The allied monarchs loaded him with honours and decorations, and the czar gave him the title of Count. He retired to his own country, there to mourn the death of his only son who had been killed in the campaign of 1812 and died near Tcherkask in 1818.

No other Russian general ever exercised such an influence over the men under his command, and their awe of him was not greater than their affection; but this was doubtless owing to the inflexible and speedy justice which he administered to them, and to the freedom with which he left them to rob and pillage.

PLATONIC LOVE, the name given to an affection subsisting between two persons of different sex, which is presumed to be unaccompanied by any sensuous emotions, and to be based on moral or intellectual affinities. The expression has originated in the view of Plato, who held that the common sexual love of the race, harassed and afflicted with fleshly longings, is only a subordinate form of that perfect and ideal love of truth which the soul should cultivate. Whether such a sentiment as Platonic love can really subsist between persons of different sex, has been frequently disputed; but without pronouncing positively on a point so delicate, and depending so much on differences in our spiritual organisation, it may be safely affirmed, that wherever a feeling—calling itself by this name—exists, it has undoubtedly a tendency to develop into something more definite and dangerous.

PLATOON (probably from the French *peloton*) was a term formerly used to designate a body of troops who fired together. A battalion was commonly divided into 16 platoons, and each company into two platoons, the platoon thus corresponding to the present subdivision. The word is obsolete in this its original sense; but it survives in the expression 'platoon exercise,' which is the course of motions in connection with handling, loading, and firing the musket or rifle.

PLATTE. See NEBRASKA.

PLATTEN-SEE. See BALATON.

PLATTSBURG, a village of New York, U.S., on the west shore of Lake Champlain, at the mouth of the river Saranac, which furnishes water-power to several mills and factories. It has a custom-house, academy, and nine churches. In Plattsburg Bay was fought the naval battle of Champlain, in which the British flotilla, under Commodore Downie, was defeated by the American commodore M'Donough, September 11, 1814; while the land forces, amounting to 14,000 men, under Sir George Prevost, were defeated by General Macomb. Pop. in 1870, 5139; in 1880, 5245.

PLATYPUS. See DUCK-BILL.

PLATYSTOMA (Gr. broad-mouth), a genus of fishes of the family *Siluridae*, having a very flat (depressed) snout, and a very large mouth with six long barbels; the skin quite destitute of scales; two dorsal fins; the eyes lateral, level with the nostrils. The species are numerous, some of them attaining a large size, many of them notable for their distinct and conspicuous markings. Several are natives of the rivers of the north-east of South America; and among these are some of the most beautiful and delicious of fresh-water fishes, as *P. tigrinum*, known among different tribes of Indians by various names—*Corutto*, *Colite*, *Oronni*, &c., which has an elongated body, light blue, transversely streaked with black and white, and a spreading forked tail. It is both taken by baited hooks and shot with arrows by Indians, as are several other species, some of which are found as far south as Buenos Ayres.

PLAUEN, an important manufacturing town of Saxony, in a beautiful valley on the White Elster, 74 miles south of Leipzig by railway. It was the chief town of the Saxon Voigtland (q. v.), and its castle was at one time the residence of the Voigt,

or advocate, but is now used as the seat of justice and other courts. P. contains a gymnasium, a royal palace, and numerous educational and benevolent institutions. It carries on extensive manufactures of muslin, cambric, and jaconet goods, as well as embroidered fabrics and cotton goods. In September 1844, 150 buildings were destroyed by fire, and after that event, the town was almost wholly rebuilt. Pop. about 40,000.

PLAUTUS, M. ACCIUS, or, more correctly, T. MACCIUS, the great comic poet of Rome, was born about 254 B.C. at Sarsina, a village of Umbria. We have no knowledge of his early life and education; but it is probable that he came to Rome while still a youth, and there acquired a complete mastery of the Latin language in its most idiomatic form, as well as an extensive familiarity with Greek literature. It is uncertain whether he ever obtained the Roman franchise. His first employment was with the actors, in whose service he saved an amount of money sufficient to enable him to leave Rome and commence business on his own account. What the nature of this business was, or where he carried it on, we are not informed; we know, however, that he failed in it, and returned to Rome, where he had to earn his livelihood in the service of a baker, with whom he was engaged in turning a hand-mill. At this time—a few years before the outbreak of the Second Punic War—he was probably about 30 years of age; and while employed in his humble occupation, he composed three plays, which he sold to the managers of the public games, and from the proceeds of which he was enabled to leave the mill, and turn his hand to more congenial work. The commencement of his literary career may, therefore, be fixed about 224 B.C., from which date he continued to produce comedies with wonderful fertility, till 184, when he died in his 70th year. He was at first contemporary with Livius Andronicus and Nævius; subsequently with Ennius and Cæcilius.

Of his numerous plays—130 of which bore his name in the last century of the republic—only 20 have come down to us. Many of them, however, were regarded as spurious by the Roman critics, among whom Varro in his treatise (*Questiones Plautinae*) limits the genuine comedies of the poet to 21. With the exception of the 21st, these Varronian comedies are the same as those we now possess. Their titles, arranged (with the exception of the Bacchides) in alphabetical order, are as follows: 1, *Amphitryo*; 2, *Asinaria*; 3, *Aulularia*; 4, *Captivi*; 5, *Curculio*; 6, *Casina*; 7, *Cistellaria*; 8, *Epidicus*; 9, *Bacchides*; 10, *Mostellaria*; 11, *Menæchmi*; 12, *Miles*; 13, *Mercator*; 14, *Pseudolus*; 15, *Pænilus*; 16, *Persa*; 17, *Rudens*; 18, *Stichus*; 19, *Trinummus*; 20, *Truculentus*; 21, *Vidularia*. As a comic writer, Plautus enjoyed immense popularity among the Romans, and held possession of the stage down to the time of Diocletian. The vivacity, the humour, and the rapid action of his plays, as well as his skill in constructing plots, commanded the admiration of the educated no less than of the unlettered Romans; while the fact that he was a national poet prepossessed his audiences in his favour. Although he laid the Greek comic drama under heavy contributions, and 'adapted' the plots of Menander, Diphilus, and Philemon with all the license of a modern playwright, he always preserved the style and character native to the Romans, and reproduced the life and intellectual tone of the people in a way that at once conciliated their sympathies. The admiration in which he was held by his contemporaries descended to Cicero and St Jerome; while he has found imitators in Shakespeare, Molière, Dryden, Addison, and Lessing.

and translators in most European countries. The only complete translation of his works into English is that by Thornton and Warner (5 vols., 1767—1774). Unfortunately the text of his plays, as they have come down to us, is in such a very corrupt state, so defective from lacunæ, and so filled with interpolations, that much yet remains to be done by the grammarian and the commentator before they can be read with full appreciation or comfort. Of complete editions, the best are those of Weise and Fleckeisen; while those plays edited by Ritschl are treated with such admirable acuteness and learning as to cause regret that they are yet so few.

PLAYFAIR, JOHN, a Scottish mathematician and natural philosopher, was born at Benvie in Forfarshire, March 10, 1748. His father, who was minister of the united parishes of Liff and Benvie, sent him to the university of St Andrews at the age of 14, to study with a view to the ministry; and here P. obtained great reputation as a diligent and successful student, especially in mathematics and natural philosophy; so much so, that while a student, he for some time discharged the duties of the Natural Philosophy chair during the illness of the professor. In 1773, he entered the ministry, and succeeded his father in the parish of Liff and Benvie. During his leisure hours, he still prosecuted his favourite studies, the fruits of these labours being two memoirs, *On the Arithmetic of Impossible Quantities*, and *Account of the Lithological Survey of Schiathallion*, which were communicated to the Royal Society of London. In 1782, he resigned his parochial charge, to superintend the education of the sons of Mr Ferguson of Raith; and in 1785, he became joint-professor of Mathematics along with Adam Ferguson in the university of Edinburgh; but exchanged his chair for that of Natural Philosophy in 1805. He took the part of Mr (afterwards Sir John) Leslie (q. v.), his successor in the Mathematical chair, and published a pamphlet full of biting satire against the 'new-sprung zeal for orthodoxy.' He became a strenuous supporter of the 'Huttonian theory' in geology, and after publishing his *Illustrations of the Huttonian Theory of the Earth* (Edin. 1802), he made many journeys for the sake of more extensive observations, particularly in 1815, when he visited France, Switzerland, and Italy. He died at Edinburgh, 19th July 1819. P., according to Jeffrey (*Annual Biography*, 1820), 'possessed in the highest degree all the characteristics both of a fine and a powerful understanding; at once penetrating and vigilant, but more distinguished, perhaps, by the caution and success of its march, than by the brilliancy or rapidity of its movements.' P. was, during the later part of his life, Secretary to the Royal Society of Edinburgh. From 1804, he was a frequent contributor to the *Edinburgh Review*, criticising the works of Laplace, Zach, and Kater, and the great trigonometrical surveys, both French and English, which had just been completed. He also wrote the articles 'Æpinus' and 'Physical Astronomy,' and an incomplete 'Dissertation on the Progress of Mathematical and Physical Science,' for the *Encyclopædia Britannica*. His contributions to the *Transactions of the Royal Society of Edinburgh* are numerous and exceedingly varied, a treatise on 'Naval Tactics' even appearing among them. His separate works are the *Elements of Geometry* (Edin. 1795), containing the first six books of Euclid, with supplementary articles on Trigonometry, Solid Geometry, and the Quadrature of the Circle; and his *Outlines of Natural Philosophy* (Edin. 1812 and 1816), being the heads of his lectures delivered in the university on that subject. A third volume of

the *Outlines*, completing the work, was promised, but never appeared.

PLEA is a technical term in the law of the United Kingdom. In England, it has a very restricted meaning, being confined to the pleading of a defendant to an action at common law. It has a similar, though still more restricted meaning when used in Chancery proceedings.—In Scotland, it is not used in the same sense, but denotes the short legal ground on which a party, whether pursuer or defender, bases his case or pleading. Hence the pleas in law are only short propositions of law. Pleas are subdivided according to their subject-matter, into pleas dilatory and peremptory, pleas of abatement, pleas to the jurisdiction. Pleas in bar are the same as peremptory pleas; but in criminal cases in England, special pleas in bar are pleas stating some ground for not proceeding with the indictment, such as a plea of former acquittal, or autrefois acquit; or of conviction, or autrefois convict; or a plea of pardon.—In Scotland, a 'plea of panel' means a plea of guilty or not guilty. Pleas of the crown was an expression anciently used to denote the divisions of criminal offences generally, as in the well-known work called *Pleas of the Crown*, by Sir Matthew Hale, and other writers. The phrase was so used because the sovereign was supposed in law to be the person injured by every wrong done to the community, and therefore was the prosecutor for every such offence.

PLEADING, as a Legal term, has two meanings —a restricted and a general meaning. In the former sense, it is a generic term to denote the written formula containing the subject-matter of a litigant's demand, or claim, or of his defence or answer thereto. In its general sense, it denotes that system of rules on which the particular pleadings of litigants are framed. In the practice of English common law, the pleadings in an action are called the declaration, plea, replication, rejoinder, surrejoinder, rebutter, surrebutter, &c.—the first being a statement of the plaintiff's demand; the second, the defence thereto, and so on, each alternately answering the other, until the parties arrive at a stop, called an issue, which means a proposition of fact, which the one affirms, and the other denies. When an issue is arrived at, the parties can go no further; and the next step is to send the issue before a jury, that they may decide it. When the parties differ, not on a question of fact, but on one of law, it is called a demurrer, which must be decided by the court. In the practice of the English Court of Chancery, the pleadings are called by other names. The suit begins either by a bill or a petition, or a summons on the part of the plaintiff, and the defendant's pleading is called the answer. In Scotland, the pleadings of the parties are called the summons (including the condescendence), the defences or answers, the revised condescendence, the revised answers, &c. The peculiar technical rules to which the pleadings of parties must conform, are capable of being understood only by lawyers.

PLEBEIANS (Lat. *plebs*, from same root as Lat. *impleo*, to fill; and Gr. *plethos*, multitude), the common people of Rome; one of the two elements of which the Roman nation consisted. Their origin, as a separate class, is to be traced partly to natural, and partly to artificial causes. The foundation of Rome, probably as a frontier-emporium of Latin traffic (according to Mommsen's suggestion), would bring about the place a number of inferior *employés*, clients, or hangers-on, of the enterprising commercial agriculturists, who laid the primitive basis

of the material and moral prosperity of the city. These hangers-on were the original plebeians, or non-burgesses of Rome, whose numbers were constantly increased by the subjugation of the surrounding cities and states. Thus, tradition states that, on the capture of Alba, while the most distinguished citizens of that town were received among the Roman patricians, the greater part of the inhabitants, likewise transferred to Rome, were kept in submission to the *populus* or patricians of Rome—in other words, swelled the ranks of the plebeians. Similar transfers of some of the inhabitants of conquered towns are assigned to the reign of Ancus Martius. The order of plebeians thus gradually formed, soon exceeded the patricians in numbers, partly inhabiting Rome, and partly the adjoining country. Though citizens, they were neither comprehended in the three tribes, nor in the *curiæ*, nor in the patrician *gentes*, and were therefore excluded from the comitia, the senate, and all the civil and priestly offices of the state. They could not intermarry with the patricians.

The first step (according to traditionary belief) towards breaking down the barrier between the two classes was the admission, under Tarquinius Priscus, of some of the more considerable plebeian families into the three tribes. Servius Tullius divided the part of the city and the adjacent country which was inhabited by plebeians, into regions or local tribes, assigning land to those plebeians who were yet without it. The plebeian tribes with tribunes at their head, formed an organisation similar to that of the patricians. The same king further extended the rights of the plebeians by dividing the whole body of citizens, patrician and plebeian, into five classes, according to their wealth, and forming a great national assembly called the *Comitia Centuriata*, in which the plebeians met the patricians on a footing of equality; but the patricians continued to be alone eligible to the senate, the highest magistracy, and the priestly offices. These newly-acquired privileges were lost in the reign of Tarquinius Superbus, but restored on the establishment of the Republic. Soon afterwards, the vacancies which had occurred in the senate during the reign of the last king, were filled up by the most distinguished of the plebeian equites, and the plebeians acquired a variety of new privileges by the laws of Valerius Publicola. The encroachments on those privileges on the part of the patricians, began the long-continued struggle between the two orders, which eventually led to the plebeians gaining access to all the civil and religious offices, acquiring for their decrees (*plebiscita*) the force of law. Under the Hortensian law (286 B.C.), the two hostile classes were at last amalgamated in one general body of Roman citizens with equal rights. Henceforth, the term *populus* is sometimes applied to the plebeians alone, sometimes to the whole body of citizens assembled in the *Comitia Centuriata* or *Tributa*, and *plebs* is occasionally used in a loose way for the multitude or populace, in opposition to the senatorial party. See PATRICIAN.

PLEBISCITE, the name given, in the political phraseology of modern France, to a decree of the nation obtained by an appeal to universal suffrage. Thus, Louis Napoleon, for example, was chosen president, and subsequently emperor, by a plebiscite. The word is borrowed from the Latin; but the *plebiscitum* of the Romans properly meant only a law passed at the *Comitia Tributa*, i. e., assembly of the *plebs*, or 'commons,' as distinguished from the *populus*, or the 'nobles;' and although it was ultimately obligatory on both classes of the community, it, of course, could only refer to such matters as it was within the province of the *Comitia Tributa* to

legislate upon, and could not fundamentally alter or destroy the constitution.

PLECTOGNATHI, in the system of Cuvier, and also in that of Müller, an order of osseous fishes, but having the skeleton less perfectly ossified than osseous fishes generally; the skin furnished with ganoid scales or spines; and particularly characterised by having the maxillary and premaxillary bones ankylosed or soldered together. The gill-lid and rays are concealed under the thick skin, with only a small opening. The ribs are very short, and there are no distinctly developed ventral fins. The fishes belonging to this order are not many. In the system of Cope they are regarded as a low type of the Percoid division.

PLEDGE is the depositing of a chattel or movable with a creditor in security of a debt, and is a contract between the parties that the pledgee shall keep the chattel till the debt is paid. In England, when A pledges property with B for a debt, and other debts are incurred, B cannot retain the pledge for the additional debts; but in Scotland, this can be done. When chattels are pledged in England for debt, the pledgee may sell the goods, if the debt is not paid at the time agreed, or within a reasonable time after notice given; but in Scotland this can only be done by getting the authority of the sheriff and a warrant to sell the goods. Owing to the frequent occasions of poor and needy persons to pledge their goods in order to procure advances of money for temporary purposes, the legislature has enacted a code of special laws to regulate these contracts. See PAWNBROKING.

PLEIADES, in Greek Mythology, were, according to the most general account, the seven daughters of Atlas and Pleione, the daughter of Oceanus. Their history is differently related by the Greek mythologists: according to some authorities, they committed suicide from grief, either at the death of their sisters, the Hyades, or at the fate of their father, Atlas (q. v.); according to others, they were companions of Artemis (Diana), and being pursued by Orion (q. v.), were rescued from him by the gods by being translated to the sky; all authorities, however, agree that, after their death or translation, they were transformed into stars. Only six of these stars are visible to the naked eye, and the ancients believed that the seventh hid herself from shame that she alone of the P. had married a mortal, while her six sisters were the spouses of different gods. Their names are Electra, Maia, Taygete, Alcyone, Celæno, Sterope (the invisible one), and Merope.

In Astronomy, a group or constellation of six stars placed on the shoulder of Taurus, the second sign of the Zodiac, and forming, with the pole-star and the twin Castor and Pollux, the three angular points of a figure which is nearly an equilateral triangle. Many believe, from the uniform agreement that the P. were 'seven' in number, that the constellation at an early period contained 'seven' stars, but that one has since disappeared; not a very uncommon occurrence.

PLEIOCENE (Gr. more recent), the name given by Sir Charles Lyell to a section of the Upper Tertiaries, because the organic remains found in it contain between 60 and 70 per cent. of living species; a greater proportion than exists in the older Miocene, but not so great as that found in the succeeding Pleistocene.

In North America they are principally found in Nebraska, Kansas, Idaho, and California. In the former region they are of fresh-water origin, and mostly of incoherent materials (Hayden). They contain numer-

ous remains of *Vertebrata*, as four species of Canidæ, two Felidæ, three ruminating hogs (*Merychys*, Leidy), six species of camels, rhinoceros, elephants, and ten species of horses of the genera *Hipparion*, *Protohippus*, *Merychippus*, and *Equus*.

In Idaho they contain numerous species of freshwater fishes and mammalia, the former Salmonidæ (*Rhabdofario*, Cope), Cyprinidæ (*Anchylopsis* and *Semotilus*), and Cobitidæ (*Diatichus*, Cope). The mammalia are *Equus* and *Mastodon*. The result of the investigations on these and the molluscs confirms those derived from the other beds and the Miocene, that there was land connection with Asia.

The beds belonging to this period in Britain are very local. They have been noticed in several places in Europe, but have been chiefly studied in Suffolk, the only locality in which they occur in Britain. Here they cover the upper beds of the London Clay; and being composed of shelly sand, they have, like similar deposits, been used for fertilising lands deficient in calcareous matter, and have received the local name of 'Crag.' They are divided into the (1) Red Crag, 50 feet; (2) Coralline Crag, 50 feet.

The Red Crag consists of beds of quartzose sands and gravel with a mixture of shells, for the most part rolled, and sometimes broken up into sand. The whole deposit, with the contained fossils, has a deep ferruginous or ochreous colour. It seems to have been formed in shallow water, the currents of which have given it a very variable character, and frequently confused the stratification, as in some modern sandbanks. The fossils have a somewhat boreal character. They consist chiefly of mollusca; but there have been also found the bones and teeth of large sharks, skates, and other fish, and the ear-bones of one or more true whales.

The Coralline Crag is generally calcareous and marly, consisting of a mass of shells and polyzoa, separated in some places by thin layers of hard limestone, and coral-like masses, which occupy the position in which they lived. It is easily separated from the Red Crag by its white colour. It has been formed at a greater depth and in more tranquil water than the newer deposit. The fossils have a more southern facies than those of the Red Crag, and indicate that they lived in an ocean with a higher temperature. Among these southern forms may be mentioned species of the genera *Conus*, *Oliva*, *Mitra*, *Voluta*, and *Pyrula*. The calcareous polyzoa are abundant and very beautiful; and several interesting forms of echini have been described. A few fossils of the same species as those occurring in the London Clay have been found in this and the Red Crag, but these are believed to have been washed out of the inferior deposits.

Mr Searles Wood has obtained 345 species of testacea from the Coralline Crag, and 230 from the Red Crag, of which about 150 are common to both; about 70 per cent. of the newer division are also recent, and about 60 per cent. of the older.

Pleocene deposits have been observed in the neighbourhood of Antwerp and on the banks of the Scheldt, from which 200 species of shells have been obtained, two-thirds of which were already known from Suffolk. More than a half are recent species found in the northern seas, and a few are still living in the Mediterranean. Similar deposits occur in Normandy. The low hills between the Apennines and the sea on each side of Italy are formed to a considerable extent of beds belonging to this period; and the marine strata of the seven hills of Rome are of the same age. Beds of a brackish water origin, observed on the shores of the Caspian, Aral, Azof, and Black Seas, have been referred to this period.

PLEIOSAU'RUS (Gr. literally 'more a lizard,'

i.e., than the *Plesiosaurus*), a genus of fossil sea-reptiles nearly allied to the *Plesiosaurus*, but having a very short neck, and comparatively a larger head. The jaws also are furnished with stronger teeth, which are subtriangular in cross section, with one side flattened, and bounded by prominent lateral ridges on the more convex sides. Three species have been described. They are peculiar to the Oxford and Kimmeridge clays of the Upper Oolite Period.

PLEISTOCENE (Gr. most recent), or NEWER PLEIOCENE, terms introduced by Sir Charles Lyell to designate the most recent Tertiary deposits, the organic remains of which belong almost exclusively to existing species. Within the last few years, no section of the earth's crust has received so much attention as the strata included under this name. The obscurity arising from great antiquity and metamorphic changes in deposits, and the consequent necessity of calling to some extent on the imagination in investigations into the older strata, have always thrown a peculiar charm round geology; but the examination of the little changed newer deposits, containing animals scarcely differing in genera from, and many of them the same even in species as, those now living, being based on simple observation, has been overlooked, although the best method in all obscure inquiries is that which starts from the known, and gradually proceeds to the unknown. The Palæozoic rocks have been carefully grouped and classified, and the fossils described and figured; while the order and contents of the Pleistocene deposits are little known. Their isolated nature to some extent accounts for this; but, on the other hand, as they exhibit the changes that have immediately preceded the present order of things, and so give us the first sure footing in our progress downwards, they deserve the most careful attention.

Not only in organic contents, but in the physical conditions under which they were deposited, the Pleistocene strata shew that the earth, as regards its general temperature, was, at the time of their deposition, in a condition nearly approaching to its present. There is consequently a considerable difference in the deposits and fossils of this period in the different regions of the world. The alluvial pampas of South America and the gravels of Australia exhibit, by their structure and contents, a temperature of some warmth; while corresponding deposits of Britain and the continent shew a state of cold that is scarcely conceivable at so recent a period. The whole of Northern Europe must have been under ice like the interior of Greenland at the present day. Perhaps the best classification of the deposits is one based on the relation which they bear to the temperature of the period when they were formed. The oldest Pleistocene deposits represent a time of intense cold. They were formed at the bottom of a sea into which immense glaciers forced their way. The fine mud in which the organic remains are buried was obtained from the melting glaciers. All the shells belong to species now living in arctic or boreal seas. The Bridlington beds, near Flamborough Head, consisting of sand, clay, and pebbles, with numerous marine shells, belong to this period. Of the 63 species determined by Dr Woodward, one-half are at present living only in seas north of Britain. The clay deposits on the east of Scotland, at Elie and Errol, lately described by the Rev. Thomas Brown, contain fossils that have a similar arctic facies. The shells of the Bridlington, Elie, and Errol deposits differ from those of the other Pleistocene strata in being much more arctic, and they consequently shew that the cold had reached its climax at the time of their formation. To this period most probably belongs the boulder-clay of

the south of England, which contains erratics from Scandinavia. Both the clay and the boulders seem to have been transported to their present position by floating icebergs.

The temperature, however, after a time improved, reducing the extent of the ice-covering, and driving the arctic fauna northwards from our shores. In the Norwich Crag, we find a larger proportion of southern species, only one-sixth of these being truly arctic. This deposit, found in the neighbourhood of Norwich, consists of beds of sand and gravel which contain fresh-water and marine shells, and the bones of large mammalia. Contemporaneous with the Norwich Crag are the marine deposits of the Clyde, at least the older of them, for though the fossils of all the beds have hitherto been grouped together, they certainly represent two periods which differ from each other by reason of the increasing temperature. While these beds were being deposited around the shores, the ice was disappearing from the land. The glaciers were gradually creeping inwards, leaving an ever-increasing margin of bare land between the glaciers and the sea, which they covered with a continuous layer of mud and rubbed stones—the materials taken up in their progress over the surface—and so forming the boulder-clay of Scotland and the north of England. This is a remarkable deposit of unstratified mud, the character and colour of which are influenced by the rocks on which it rests, and from which it was derived. It contains numerous rounded and polished blocks of stone of various sizes, promiscuously scattered through it, the whole seeming to be the result of an irregular pell-mell hurrying forward and deposition of the materials. It has been always a puzzle to geologists (see BOULDER-CLAY); but Mr Geikie, in his recently published Memoir, by shewing it to be the terminal moraine formed by the slowly retreating sheet of glacier-ice, has given an explanation which meets all the singular phenomena connected with it. Connected with the disappearance of glaciers, are the lateral moraines which exist on many hillsides; and perhaps a little later, the long ridges of gravel which are called Kames in Scotland, and Eskers in Ireland. The loamy deposits of the valleys of the Rhine and the Danube, known as the Loess, were formed at this time by the fine mud from the glaciers, with which every torrent rushing from the icy caverns at the termination of a glacier is charged, and which is now forming a similar deposit in some places on the coast of Greenland.

When the glaciers began to disappear, mammalia again occupied the land; their remains, we have already seen, occur in the Norwich Crag. They continued to increase as the conditions for their existence improved. The caves of the British Islands and the continent were inhabited by hyenas, bears, and other wild beasts, which have left their remains buried in the mud at the bottom of the caves. The raised sea-beaches of this period contain the shells of mollusca now living in the neighbouring seas. In many places around the shores of Britain and Ireland, submarine forests are met with dipping down under low water, and exhibiting the stumps and roots of trees, in the position of growth, belonging to species now living in Britain. Some of the older peat-bogs require to be placed also among the later Pleistocene deposits.

The classification, then, of these strata, which we propose, from the light thrown on them by recent observation, may be put into the following tabular form. The subdivisions are the names of recognised deposits, and though arranged in tabular series, the order is not one of strict sequence, representing the superposition of the different beds; they are all very local deposits, and many of them, though

differing in character, were formed contemporaneously.

Post-Glacial.	{	Peat-bogs.
		Submarine Forests.
Glacial.	{	Modern Raised Sea-beaches.
		Cave Deposits.
Arctic.	{	Loess.
		Kames and Eskers.
	{	Lateral Moraines.
		Boulder-clay.
	{	Newer Clyde Beds.
		Older Clyde Beds.
	{	Elle, Erol, and Tirle Clay Beds.
		Bridlington Beds.

Many speculations have been made as to the causes of the remarkable change of temperature, from the comparatively warm period of the Pleiocene deposits, to the extreme cold of the early Pleistocene strata, and the subsequent gradual return to the warmer temperature of the present period. The most probable is, that it resulted from an extensive depression of the land of the northern hemisphere in some parts, and its elevation in others during the period. Deposits of glacial shells have been found more than 1000 feet above the sea-level in Wales. A depression much less than this, in the Isthmus of Panama, would give a different direction to the Gulf Stream, and so deprive Western Europe of its benignant influences. It would also put the immense sandy Sahara under water; and that it has been so at a comparatively recent period, has been clearly established by the discovery lately of existing marine shells (including *Cardium edule*) over an extensive district of the desert. Without the Sahara, the south of Europe would have no burning dry sirocco, which now melts the glaciers of the Alps; but instead, a comparatively cold sea-breeze, laden with moisture, which would to a large extent feed them. These and similar causes would do much, if they were not in themselves sufficient, to produce the extreme cold of the arctic period.

North America, on the close of the glacial portion of this period, received a part of its fauna from the South. The caves examined by Professor Cope, in Virginia and Pennsylvania, have disclosed remains of six species of gigantic sloths, two of tapirs, many peccaries, capybara, bears of South American type, etc. With these were porcupines, bison, deer, bear, raccoon, and other North American genera, with horses, lion, squirrel, arvicola, etc., now more widely spread. A warmer climate prevailed at this period in South America, and the fossil animals there belong to types still peculiar to that continent, though of a size immensely greater than their living representatives. The *Megatherium*, *Mylodon*, and *Megalonyx* were the gigantic fore-runners of the living sloth; and the small armadilloes were anticipated by the *Glyptodon*. The llamas, opossums, tapirs, and prehensile-tailed monkeys are the diminutive representatives of similar forms in the Pleistocene period. The peculiar marsupial fauna of Australia had also its gigantic fore runners during this period. The skull of one species (*Diprotodon*, an animal between the kangaroo and the wombat), now in the British Museum, measures three feet in length. The huge wingless *Dinornis*, and its allies of New Zealand, were nearly allied to the small wingless *Apteryx*, now living in that island.

The question of the antiquity of man is intimately associated with the Pleistocene deposits. Whatever be the age of the beds in which either the remains of man or works of art have been found, it is certain that none of them pass the horizon of the boulder-clay. It is, however, equally certain that undoubted evidences of his existence contemporaneously with the mammoth and woolly rhinoceros,

with the cave-lion and hyæna, have been found in Britain; and setting aside the various French and Belgian caves and gravel deposits about which geologists are, with good cause, so divided, there is evidence in the knives, pins, &c., manufactured from the bones of the large reindeer, found in caves at Bruniquel and elsewhere, that man hunted this huge extinct animal. Its contemporaries, as far as the associated remains from these caves have been determined, yet survive: these were the chamois, ibex, horse, fox, wolf, hare, raven, partridge, and salmon. However far, when measured by years, this carries back the first appearance of man on the globe, geologically speaking, the time is insignificant as compared with the vast lapse of ages represented by even a single formation; still it represents a period in which many remarkable changes have taken place, both in the climatal condition of Europe and in its animal inhabitants.

PLENISHING, in the law of Scotland, denotes the furniture of a house or stocking of a farm. The term is now seldom used, except in the law relating to heirship Movables (q. v.).

PLEONASM (Gr. *pleon*, more), a term employed in Rhetoric to denote superfluity of expression.

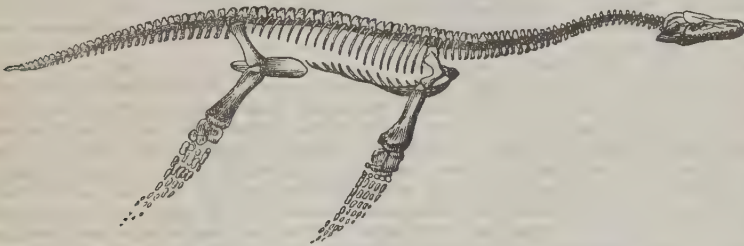

PLESIOSAURUS (Gr. near to a lizard), a remarkable genus of fossil sea-reptiles, the species of which are found in the Lias, Oolite, and Cretaceous measures. Its remains are so abundant and so perfectly preserved, that we are as well acquainted with skeletons of many of its species as we are with those of any living animals. These represent a strange animal, the structure of which Cuvier considered to be the most singular, and its character

round the periphery. The cervical vertebræ consist of a centrum, neural arch, and two ribs, which articulate into two pits on the sides of the centrum. In the dorsal vertebræ, the ribs are articulated to diapophyses from the neural arch; and in the tail, they gradually descend again to the sides of the centrum. The tail is much shorter than in the ichthyosaur. In the abdominal region, the extremities of each pair of ribs are connected below by the development of the hæmal spine.

The two pair of limbs were equal in size and shape, with probably a single exception. The bones of the hind-limbs closely correspond in number, arrangement, and form with those of the fore-limbs, so that the descriptions of the one set answer to the corresponding bones of the other. The humerus is a stout and moderately long bone, curved slightly backwards, rounded at its proximal extremity, and flattened as it approaches the elbow joints. The radius and ulna are short and flat bones—the former straight, the latter reniform, with the concavity toward the radius. The carpus consists of six to eight flat round bones in a double row. The five metacarpals are long, slender, and slightly expanded at both ends. The numerous phalanges are alike in form, but progressively decrease in size. The radial digit has generally three; the second from five to seven; the third, eight or nine; the fourth, eight; and the fifth, five or six phalanges. The limbs were covered with integument, so as to form simple undivided paddles, as in the turtle.

The supposed habits of the plesiosaur are thus described by Conybeare: 'That it was an aquatic, is evident from the form of its paddles; that it was marine, is almost equally so, from the remains with

which it is universally associated; that it may have occasionally visited the shore, the resemblance of its extremities to those of the turtle may lead us to conjecture; its motion must have, however, been very awkward on land; its long neck must have impeded its progress through the water, presenting a

Plesiosaurus.

the most anomalous, that had been discovered amid the ruins of former worlds. In the words of Buckland: 'To the head of a lizard, it united the teeth of a crocodile, a neck of enormous length, resembling the body of a serpent, a trunk and tail having the proportions of an ordinary quadruped, the ribs of a chameleon, and the paddles of a whale.'

The skull is small and depressed. From the nostrils backwards, it is quadrate; it suddenly contracts at the nostrils, and is continued into a parallel-sided apex, which is sometimes slightly swollen at the point. No sclerotic plates have been found in the orbits. The rami of the lower jaw are remarkably expanded at their anterior anchylosed extremity. No intervening vacuity separates the angular and surangular pieces, as in the crocodiles, but they are joined throughout, as in the lizards. The teeth occupy distinct cavities; they are sharp-pointed, long, slender, circular in cross section, and with fine longitudinal ridges on the enamel. The most striking peculiarity of the vertebræ is the great length of the neck-portion, which is composed of from 20 to 40 vertebræ. The articular surfaces of the bodies of the vertebræ are either flat or slightly convex in the centre, with a concavity

striking contrast to the organisation which so admirably fits the ichthyosaur to cut through the waves. May it not, therefore, be concluded—since, in addition to these circumstances, its respiration must have required frequent access to the air—that it swam upon or near the surface, arching back its long neck like the swan, and occasionally darting it down at the fish which happened to float within its reach? It may perhaps have lurked in shoal-water along the coast, concealed among the sea-weed, and, raising its nostrils to the surface from a considerable depth, may have found a secure retreat from the assaults of dangerous enemies; while the length and flexibility of its neck may have compensated for the want of strength in its jaws, and its incapacity for swift motion through the water, by the suddenness and agility of the attack which they enabled it to make on every animal fitted for its prey which came within its reach.'

The first remains of this animal were discovered at Lyme Regis in 1822. Since then, twenty-two species have been described, the specific differences chiefly resting on peculiarities in the form and structure of the vertebræ.

PLETHORA—PLEURISY.

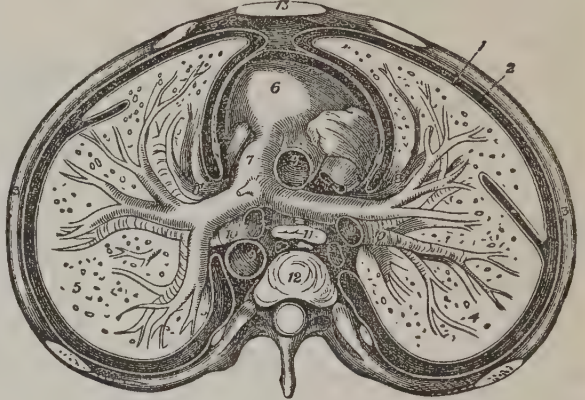

PLETHORA (Gr. 'fulness' or 'excess'), designates a general excess of blood in the system. It may arise either from too much blood being made, or from too little being expended. The persons who become plethoric are usually those in thorough health, who eat heartily and digest readily, but who do not take sufficient bodily exercise, and do not duly attend to the action of the excreting organs. With them, the process of blood-making is always on the increase, and the vessels become more and more filled, as is seen in the red face, distended veins, and full pulse. The heart is excited and over-worked, and hence palpitation, shortness of breath, and probably a sleepy feeling, may arise; but these symptoms, instead of acting as a warning, too often cause the abandonment of all exercise, by which the morbid condition is aggravated. The state of plethora thus gradually induced may be extreme without any functions materially failing, and yet the subject is on the verge of some dangerous malady, such as apoplexy, or structural disease of the heart or great vessels, or of the lungs, kidneys, or liver.

Plethora is said to be *sthenic* when the strength and irritability of the muscular fibres (especially of the heart and arteries) are fully or excessively developed. This form commonly affects the young and active, and those of sanguineous nature. The blood is rich in red cells and fibrine; and there is a tendency to general febrile excitement, active hæmorrhages, fluxes, and inflammation. A natural cure is thus often effected by the supervention of an attack of bleeding from the nostrils or from piles, or of mucous or bilious diarrhoea. The plethora is said to be *asthenic* (Gr. *a*, not; and *sthenos*, strength) when there is a deficiency of contractility and tone in the muscular fibre. In this case, the heart and vessels, instead of being excited (as in sthenic plethora) by the augmented quantity of blood, are oppressed by its load, and cannot duly expel their accumulated contents. The face is purple instead of red; the extremities cold, and the excreting organs sluggish. This form affects persons weakened by age, excesses, or previous disease. It tends to produce congestions and passive hæmorrhages, fluxes, and dropsies; and, if continued, structural changes, such as dilatation of the heart, enlarged liver, varicose veins, &c.

In *sthenic* plethora, blood-letting is the first remedy, and this, with the continued use of aperient medicine and a sparing diet, is often sufficient to complete the cure. If these means fail, recourse must be had to antimonials, salines, digitalis, and sometimes mercury or colchicum. In the *asthenic* form, Dr Williams (to whose article on 'Plethora,' in his *Principles of Medicine*, we refer our readers for further details) observes that 'the continued use of alterative aperients and diuretics, such as mild mercurials, with rhubarb, aloes, or senna, salines and taraxacum, nitric acid, iodide of potassium, &c., may prepare the way for various tonics, such as calumba, bark, and iron.' He also recommends the use of the Cheltenham, Leamington, and Llandrindod waters; first the saline, which are aperient and diuretic; and afterwards the chalybeate, which, although tonic, usually contain enough of saline matter to keep the secretions free. Food may be taken more freely than in the sthenic form; and in both varieties, as much exercise in the open air

should be taken as can be borne without causing exhaustion.

PLEURÆ. Each lung is invested externally by a very delicate serous membrane termed the *pleura*, which, after enclosing the whole organ, except at its root, where the great vessels enter it, is reflected upon the inner surface of the thorax or chest. That portion of the pleura which is in contact with the surface of the lung is called the

A transverse Section of the Thorax, shewing the reflections of the Pleura, and the relative position of the Viscera, &c.

(From Gray's Anatomy.)

- 1, The visceral and, 2, the parietal layer of the pleura, on the right side; 3, 3, the ribs; 4, 5, section of the right and left lungs; 6, the heart; 7, the pulmonary artery, dividing into the right and left branches; 8, 8', the right and left pulmonary veins; 9, 9', the ascending and descending aorta, the intervening arch being cut away; 10, 10', the right and left bronchi; 11, the œsophagus; 12, body of dorsal vertebra; 13, the sternum.

pleura pulmonalis, or visceral layer; whilst that which lines the interior of the chest is called the *pleura costalis*, or parietal layer; while the space intervening between these two layers is called the *cavity of the pleura*. Each pleura, as will be at once seen by a reference to the figure, is a closed sac, and quite independent of the other. The interspace between the pleuræ on the right and left side, is termed the *mediastinum*, and contains all the viscera of the thorax excepting the lungs. The inner surface of each pleura is smooth, glistening, and moistened by a serous fluid; the outer surface is closely adherent to the surface of the lung, to the roots of the pulmonary vessels as they enter the lung, to the upper surface of the diaphragm, and to the walls of the chest. The lobes of the lungs are separated from one another by involutions or in-foldings of the visceral layer; two such involutions—one on either side—are shewn in the figure. The use of these serous sacs is much the same as that of the *Peritoneum* (q. v.); each pleura retains the lung and, to a certain extent, the greater vessels in position, while it at the same time facilitates, within certain limits, the movements of those parts which are essential to the due performance of the act of respiration.

PLEURISY, or inflammation of the investing membrane of the lung, is one of the most serious diseases of the chest. It is very often, but by no means invariably associated with inflammation of the substance of the lung, commonly known as *Pneumonia* (q. v.). Pleurisy without pneumonia is much more common than pneumonia without pleurisy. When both are present, but pneumonia preponderates, the correct term for the affection is *pleuro-pneumonia*, although it is frequently spoken of simply as pneumonia, probably in consequence

of the remedies being applied mainly to it, as the more important of the two elements in the compound malady.

The pleura being a serous membrane, its inflammation is attended with the same course of events as have been already described in our remarks on the two allied diseases, *Pericarditis* and *Peritonitis*. The inflammation is of the adhesive kind, and is accompanied by pain, and by the effusion of serum, of fibrinous exudation (the *coagulable lymph* of the older writers), or of pus, into the pleural cavity. In consequence of the anatomical relations of the pleura—one part of the membrane (the parietal) lining the firm walls of the chest, while the other part (the visceral) envelops the soft and compressible lung; and these opposed surfaces being freely movable on one another—it follows that very different effects may be produced by its inflammation. For example, the visceral layer may be glued to the parietal layer, so as to prevent all gliding movement between them, and to obliterate the pleural cavity (similarly to what often happens in *Pericarditis*, q. v.); or the two surfaces which are naturally in contact, may be abnormally separated by an infusion of serum between them; or from a combination of these results, the opposite surfaces of the pleura may be abnormally united at some points, and abnormally separated at others.

The general symptoms of pleurisy are rigors, pain in the side, fever, difficulty and rapidity of breathing, cough, and an impossibility of assuming certain positions; and of these, the most marked is the pain or *stitch in the side*, the *Point de côté* of the French writers. From the prominence of this pain, which occupies a single spot, and is of a sharp, stabbing character, the Latin writers term pleurisy *Morbus lateris*. This spot is usually about the centre of the mamma of the affected side, or just below it; but why the pain should be usually restricted to that one small spot, when the inflammation pervades a considerable extent of surface, is a question that has never received any satisfactory answer. The pain is, however, occasionally felt in other parts—as in the shoulders, in the hollow of the armpit, beneath the collar-bone, along the breast-bone, &c. Cruveilhier observes that the pain sometimes affects the loins, and simulates lumbago; while Andral and Dr Watson have directed attention to the fact, that the pain often affects the hypochondrium, and may be readily mistaken for a symptom of peritonitis, or (if occurring on the right side) of hepatitis. The pain is increased by percussion, by pressure between the ribs, by a deep inspiration, by cough, &c.; and the patient is often observed to suppress a natural desire to cough, or never to draw more than a short and imperfect inspiration. The cough is not invariably present, although it is an ordinary symptom. It is small, suppressed as far as possible by the patient, and is either dry, or accompanied by the expectoration of slight catarrh. If much frothy mucus is brought up, it is a sign that Bronchitis (q. v.) is also present, and the appearance of rust-coloured sputa indicates the co-existence of pneumonia. Although the above named symptoms, especially when most of them occur together, afford almost certain evidence of the existence of pleurisy, yet to the physician the physical signs are still more valuable, especially those furnished by percussion and auscultation.

Pleurisy far more commonly arises from exposure to cold than from any other cause, especially if a poisoned condition of the blood, predisposing to inflammation of the serous membrane, is present; but it may be occasioned by mechanical violence (as by a penetrating wound of the thorax by the splintered ends of a broken rib, &c.), or by the

accidental extension of disease from adjacent parts. The disease may terminate in resolution and complete recovery; or in adhesion, which often only causes slight embarrassment of breathing: or it may end with such a retraction of one side of the chest as to render the corresponding lung almost or totally useless: or it may cause death either directly by actual suffocation, if the effusion is very copious, and is not removed by tapping; or indirectly, by exhaustion. It is seldom, however, that simple pleurisy proves fatal.

In acute pleurisy, occurring in a robust and previously healthy subject, free blood-letting should be at once resorted to. If there is a sharp stitch in the side, and the respiration is short, quick, and restrained, the patient should be bled, in the upright position, from a large orifice in the vein, until the pain is relieved, and he can draw a full breath without discomfort, or until he is about to faint; and if the pain and difficult breathing should return, and the pulse continue firm and hard, either the venesection must be repeated, or leeches must be freely applied to the painful side. The bowels should be freely evacuated, after which calomel should be given, guarded with a little opium, to the extent of producing *slight* mercurialisation, with the view of checking the effusion of fluid. The more rapidly the system can be thus affected, the better, and hence it has been recommended (by Dr Walsh) that during the first six hours a grain and a half of calomel, combined with a sixth of a grain of opium (or more, if the pain continues acute), should be given every half-hour; while mercurial ointment is rubbed into the skin of the affected side, near the arm-pit, every fourth hour. Care must be taken that neither decided salivation nor narcotism is induced; and as soon as there is any evidence from the breath, or from the appearance of the gums, that the mercurial action has been established, the further administration of the calomel and the ointment must be suspended. After the pain and fever have ceased, we must facilitate the absorption of the fluid by diuretics. A pill composed of half a grain of digitalis, a grain of squills, and three grains of blue pill taken twice a day, usually acts efficiently; and the compound tincture of iodine of the London (*not* the British) Pharmacopœia, in doses of twenty minims, taken, largely diluted, three times a day, has been strongly recommended.

There has been considerable discussion of late years as to how far the operation of tapping the chest, and letting out the fluid, is justifiable in this disease. The best authorities are of opinion that in simple pleurisy it ought never to be performed unless (1) the life of the patient is in immediate danger from the continued pressure of the fluid in the sac; (2) unless all other means of getting rid of the fluid having failed, the patient is evidently losing strength daily; and (3) unless there is good reason to believe that the fluid consists of pus, in which case it should be let out. In all cases in which the operation is contemplated, a grooved needle should be introduced into the pleura. By this means, we not only ascertain the actual presence of fluid, but we discover its nature. If it be serous, it will flow readily along the groove, and trickle down the patient's side; if it be purulent and thick, a drop or two will probably be visible at the external orifice, and when the needle is withdrawn, its groove will be found to contain pus. The puncture thus made is quite harmless, and inflicts very little pain.

PLEURISY ROOT. See BUTTERFLY WEED.

PLEURODYNIA is a rheumatic affection of the intercostal muscles, and is characterised by acute pain in the side upon taking a full breath or coughing.

and by great tenderness on pressure. If it happens to be attended by slight febrile excitement, or by a cough, it is impossible to distinguish it from pleurisy, except by attending to the physical signs which characterise the latter disease. Cruveilhier maintains that 'pleurodynia is nothing more than adhesive pleurisy,' and in many cases of assumed pleurodynia, there is little doubt that the pain is due to old adhesions. The disease generally yields to local measures, such as blistering, or counter-irritation in a milder form by rubefacient liniments. A mixture of soap-liniment and chloroform rubbed over the affected part two or three times a day, often gives relief. In the more persistent cases, leeches may be applied with benefit.

PLEURONECTIDÆ, a family of fishes included in Cuvier's order *Malacopterygii*, but belonging to the order *Anacanthini* of Müller's system (see *MALACOPTERYGII*), and remarkable for a character to which there is nothing similar in any other vertebrate animals, a want of symmetry in the head, and for swimming not with the back uppermost, like other fishes, but with one side uppermost. The peculiar structure of the head adapts it to this mode of swimming, both eyes being on that side which is uppermost. Some of the bones of the head are distorted to a very considerable degree, but there is no want of symmetry in those of the body. The sides of the mouth are unequal. The body is extremely compressed, whence the P. are popularly termed *Flat Fish*, the back and belly being mere edges fringed by the dorsal and anal fins. The pectoral fins are generally unequal, also the ventral fins, those of the lower side being smaller than those of the upper. The upper side is often brown, or of some darkish colour, and variously marked; the lower side whitish. The colour of the upper side generally corresponds so much with that of the bottom, close to which these fishes swim, that they readily escape observation; and on this they seem chiefly to depend for safety, although, when hard pressed, they raise themselves in a vertical position, and suddenly throw themselves upward and forward to some distance, but then resume their ordinary posture, and as close to the bottom as possible. Their ordinary swimming is by a kind of undulating movement. They swim with great activity. They have no air-bladder. They abound chiefly where the bottom is smooth, either muddy or sandy. All of them are sea-fishes, but some are very common in brackish water, ascend rivers, and can be kept in fresh-water ponds. Many of them are in great esteem for the table. The turbot, halibut, brill, plaice, and flounder are examples of this family.

PLEURO-PNEUMONIA, in an epizootic form, first appeared amongst the horned cattle of Great Britain and Ireland in 1841. From time immemorial it had, however, been known in the great cattle-breeding plains of Central and Northern Europe. It consists in a sub-acute inflammation of the structure of the lungs and their investing membrane, shews a great tendency to early exudation, and is accompanied by low fever. It is contagious, but, like many other contagious disorders, it occasionally occurs independently of contagion, and is fostered by overcrowding, exposure to cold and wet, damp, dirty hovels, and other such causes, which depress the vital powers. The symptoms come on insidiously, appetite and rumination are irregular, there is fever, dulness, a short, half-involuntary cough, with quickened breathing and pulse. In cows, the yield of milk is early diminished. After three or four days, large portions of the lungs become filled with the products of

inflammation, hence the laboured breathing, quick indistinct pulse, wasting, and fatal weakness. Death generally occurs in from ten to twenty days. When pleuro-pneumonia first appeared in this country, it was greatly more fatal than it has since become, and fully four-fifths of the cattle attacked died; with prompt and rational treatment, more than one-half of the affected cases now recover. But as a favourable result is uncertain, and much flesh is lost even during a slight attack, it is still advisable, when pleuro-pneumonia breaks out in a herd, to consign to the shambles any of the cattle in good condition that have mixed with those diseased. The best treatment consists in avoiding bleeding and all reducing remedies, supporting the strength, and keeping up the action of the skin, bowels, and kidneys, in order that the poisonous products of the disease may be rapidly got rid of. For this end, the patient should be provided with a cool comfortable house, clothing to the body, bandages to the legs, a daily dose of two ounces each of nitre and common salt given in treacle and water. When the bowels are costive, gentle laxatives are required. By the second or third day, counter-irritants may be applied to one or both sides, which should first be bathed with hot water and thin mustard paste, or a mixture of cantharides and euphorbium ointments well rubbed in. By the third or fourth day, or earlier, if there is weakness, arrested secretion, and coldness of the skin, give several times daily some stimulant, such as a quart of warm ale, with an ounce or two of ginger or other stomachic, some good whisky-toddy, three-ounce doses of sweet spirit of nitre, or of spirit of ammonia. Whilst the disease continues, and even during early convalescence, all food requiring rumination must be interdicted, and mashes, flour and treacle, bruised grain, or any light digestible articles substituted for the ordinary hay, straw, or roots. As pleuro-pneumonia is in many cases propagated by contagion, the sick should be separated from the sound stock; and any premises they have occupied carefully cleansed by whitewashing, and the use of McDougall's, Condyl's, or other effectual disinfectants. When pleuro-pneumonia prevails in a neighbourhood, all fresh purchases should be placed in quarantine, and kept perfectly away from the home-stock for at least three weeks. Attention to this simple precaution has preserved many farmers from pleuro-pneumonia, even while it has raged all around them.

PLEXIMETER. See **PERCUSSION**.

PLEYEL, IGNAZ, a musical composer of some note, born in 1757 at Rupperstahl, near Vienna. He studied music under Vanhall and Haydn, and made in early life an extensive tour in Italy, to hear the works of the best composers. In 1783, he was made *Capellmeister* of Strasburg Cathedral, and during the succeeding ten years, composed most of the works on which his popularity rests. In 1791, he visited London, and composed there three symphonies. Two years afterwards, during the frenzy of the French Revolution, he fell under suspicion, and in proof of his acquiescence in the new order of things, had to compose a musical drama for the anniversary of the 10th of August; which saved his life. After a long career in Paris as a publisher of music and pianoforte manufacturer, he retired to an estate which he had purchased near Paris, and died in 1831. His compositions, consisting of quartetts, concertantes, and sonatas, are full of agreeable melodies, sometimes light and trivial, but occasionally vigorous.

PLICA POLONICA is the name given to a disease of the scalp, in which the hairs become

matted together, by an adhesive and often fetid secretion, and which is especially prevalent in Poland, although it occasionally occurs in other countries. The hair is found, on microscopic investigation, to be infested with a fungus of the genus *Trichophyton*. The only treatment that is beneficial is the removal of the hair, and strict attention to cleanliness; but as it is popularly believed in Poland that this affection affords a security from all other sickness and misfortune, it is often difficult to persuade patients to have recourse to these means. For an account of the parasitic fungus that attacks the hair in this disease, and of the changes of structure which it induces, the reader is referred to Küchenmeister's *Manual of Parasites*, vol. ii. pp. 148—152.

PLINTH, the square member at the bottom of the base of a column. Also the plain projecting band forming a base of a wall.

PLINY (C. PLINIUS SECUNDUS), often called Pliny the Elder, and author of the celebrated *Historia Naturalis*, was born in the north of Italy, either at Novum Comum (*Como*) or Verona, 23 A.D. Whether it was his birthplace or not, the former town was certainly his family's place of residence, since he had estates in its neighbourhood; his nephew, the Younger Pliny, was born there, and inscriptions relating to members of his family have been found near it. While still young, he was sent to Rome, where his ample means and high connections secured him the best education. At the age of 23, he entered the army, and served in Germany, as commander of a troop of cavalry, under L. Pomponius Secundus, of whom, in later life, he wrote a memoir. He travelled over nearly all the frontier of that extensive province, visited the Cauci and the sources of the Danube, composed during the intervals of military duty his treatise *De Jaculatione Equestri*, and commenced a history (afterwards completed in twenty books) of the Germanic wars. On his return to Rome in 52 with Pomponius, he entered on the study of jurisprudence; but his practice as a pleader proved him to have no great capacity for the legal profession; and accordingly, he retired to his native place, where he spent the greater part of the reign of Nero in miscellaneous authorship. It was during this period that he wrote his *Studiosus*, a treatise in three books on the training of a young orator from the nursery to his entrance on public life, and apparently intended to guide the education of his nephew; also his grammatical work, *Dubius Sermo*, in eight books. Shortly before Nero's death, we find him a procurator in Spain, where, in 71, he heard of his brother-in-law's decease, and of his being intrusted with the guardianship of his nephew, Pliny the Younger, whom he adopted on his return to Rome before 73. Vespasian, the reigning emperor, whom he had known while serving in Germany, received him as one of his most intimate friends; and it was at this period that he completed, in thirty-one books, and brought down to his own time, the Roman history of Aufidius Bassus. His mode of study at this time was a model of systematic assiduity. When living in the busy world of Rome, he would begin his studies by candle-light in autumn at a late hour of the night, and in winter at one or two in the morning. Before daybreak, he would call on the emperor, for whom he would proceed to execute various commissions; this done, he would return home, and resume his studies. A slender meal would follow; after which he would, in summer weather, lie in the sunshine, and take notes or extracts from the books which were read to him. The practice of jotting down important facts or

observations was habitual with him, and he was often heard to say that there was no book, however bad, from which some good could not be got. A cold bath, followed by a light meal and a short sleep, occupied another interval, after which he would study till the *cena*, or dinner-time. Even at this meal, some book was read to him, on which he would make comments. When in his country residence, he studied nearly all the time, except when in the bath; and even then, while his attendants were performing the duties incident to that luxury, he would be listening to some one who read to him, or he would be dictating to his amanuensis. When on a journey, again, he was never without a secretary at his elbow, provided with a book and tablets. By this mode of life, he collected an immense mass of materials, from which he compiled his great *Historia Naturalis*, published about 77. No fewer than 160 *volumina* of notes were found at his death, two years afterwards. The great eruption which, in 79, submerged Herculaneum and Pompeii was at its height when he was stationed off Misenum, in command of the Roman fleet. Eager to examine the phenomenon more closely, he landed at Stabiae, where he was suffocated by the vapours caused by the eruption. He was, as his nephew tells us, corpulent and asthmatic, and sunk the more readily. None of his attendants shared his fate.

Of all his works, only his *Historia Naturalis* has come down to us. It comprehends a greater variety of subjects than we now regard as included under that title. Astronomy, meteorology, geography, mineralogy, zoology, botany, everything, in short, which is a natural or non-artificial product, finds a place in P.'s Natural History. Even to this elastic interpretation of the term, he by no means rigidly adheres; the work being interspersed with digressions on such subjects as human institutions and inventions, and the history of the fine arts. It is divided into 37 books—the first of them being a dedicatory epistle to Titus, with a table of contents of the remaining books, and embraces, as we are told in the preface, 20,000 matters of importance, extracted from about 2000 volumes. Its scientific merit is not great. There is little attempt at philosophical arrangement; the observations are nearly all taken at second-hand, and shew small discrimination in separating the true from the false, or the probable from the marvellous. His meaning is often obscure, from his writing of things with which he was personally unacquainted, and from his having missed the true sense of the authors whom he cites or translates. But it cannot be denied that the work is a great monument of industry and research—most praiseworthy as having been constructed and completed amid the labour of other onerous undertakings, and amid the distractions of a life engaged in active official employment; and most valuable as supplying us with details on a great variety of subjects, as to which we have no other means of information. The best critical edition of the text is that of Sillig (Leips. 5 vols. 1831—1836). The best commentary is that of Panckoucke, which embodies, along with a French translation, the notes of Cuvier and other distinguished French savants. Pliny's work has been translated into almost all European languages.

PLINY (C. PLINIUS CÆCILIUS SECUNDUS), nephew of the preceding, and son of C. Cæcilius, frequently called Pliny the Younger, was born at Novum Comum, 61 A.D. He was still young when he lost his father, and was adopted by his uncle, under whose care, and that of his mother, Plinia, and his tutor, Virginus Rufus, his education was prosecuted. Passionately devoted to literature, he wrote a Greek

tragedy at the age of 13; studied eloquence under Quintilian; and became so famous for his literary accomplishments, that he acquired the reputation of being one of the most learned men of the age. His oratorical powers were also considerable; in his 19th year, he began to speak in the forum; and his services as an advocate before the court of the Centumviri and the Roman senate were in frequent request. He held numerous official appointments; served, while a young man, as *tribunus militum* in Syria, where he listened to the teaching of Euphrates the Stoic, and Artemidorus; was afterwards *questor Cesaris*; was praetor about 93, and consul in 100, when he wrote his *Panegyricus*, an adulatory eulogium of the Emperor Trajan, and containing little information as to the author and his times. He was appointed, in 103, proprator of the province Pontica, an office which he vacated in less than two years; and he also discharged the function of curator of the banks and channel of the Tiber. He was twice married, his second wife being Calpurnia, granddaughter of Calpurnius Fabatus, and considerably younger than her husband, by whom she was much beloved for her accomplishments and amiability. He had no issue by either marriage.

Our knowledge of P. the Younger is mainly derived from his letters or *Epistolæ*, of which there are ten books. He collected them himself, and probably wrote many of them with a view to publication. They hold a high place in epistolary literature, and give us many interesting glimpses into the life of their author and his contemporaries. P. himself appears in them to considerable advantage, as a genial and philanthropic man, enamoured of literary studies, and fond of improving his estates by architectural ornament. His ample fortune was liberally bestowed; and his slaves always found in him an indulgent master. Infirm health impaired throughout life his constitution, which was naturally weak; but of the time or cause of his death, we know nothing. Of the facts contained in his letters, however, the most interesting to us are those relating to the punishment of the Christians. Death appears to have been the penalty attached even to the confession of being a Christian; although the adherents of the faith admitted no other acts, on examination, than those of meeting on a fixed day before dawn, when a hymn to Christ was sung, and taking an oath to avoid theft, adultery, breach of faith, and denial of a deposit. Nothing more unfavourable to them than this could be extorted by P. from two female slaves, reputed to be deaconesses, whom he put to the torture. P. having asked Trajan how he was to stop the spreading superstition, the emperor replied that no general rule could be laid down; that he ought not to institute a search after persons supposed to be Christians; but if any were brought before him, and the charge was proved, such were to be punished, if still impenitent. The best edition of P.'s *Panegyricus* and *Epistolæ* together, is that of Schaefer; of the *Epistolæ* alone, that of Gierig.

PLOCARIA, a genus of *Algæ*, of the order or suborder *Ceramiceæ*, having a cartilaginous frond, composed of large cells, as if jointed, and dividing into slender, tufted, and densely aggregated branches. *P. helminthochorton* is the CORNIC Moss of the apothecaries' shops, once of some reputation as a vermifuge, but now little used, and believed to be of little efficacy. It is a small plant, with a filiform entangled frond, and grows on the shores of the Mediterranean. It has a strong marine odour and a salt taste. It consists in great part of a vegetable jelly or mucilage, which renders it nutritious, and contains much chloride of sodium, sulphate of lime, and carbonate of lime. As sold in the shops,

it is always much mixed with other *algæ*.—*P. lenax* is a small plant with filiform, branched, and somewhat gelatinous frond, much used by the Chinese as a glue. It is also used in China as an article of food.—*P. candida* is used to a considerable extent as an article of food in the East. It is popularly called CEYLON MOSS. The frond is whitish and much branched, the branches long and somewhat clustered. It is exported to China from the islands of the Indian Archipelago, forming a portion of the cargo of almost every junk. The Chinese make it into a jelly with sugar, and use it as a sweetmeat. It consists in great part of a vegetable jelly, with a considerable quantity of starch. It has been introduced into Britain as a light and nourishing food for children and invalids, and is found particularly suitable in cases of irritation of the mucous surfaces.

PLOCE'US. See WEAVER BIRD.

PLOCK (Russ. Plotzk), a town of Poland, capital of the government of the same name, occupies an elevation on the right bank of the river Vistula, 78 miles west-north-west of Warsaw. Its principal buildings are the cathedral, built in 961, the bishop's palace, theatre, &c. Agriculture, and the export of grain to Danzig and other ports, are the chief employments. Pop. about 25,000.

PLOCK (Russ. Plotzk), a government in the north of Poland, bounded on the north by Prussia, and on the south-west by Warsaw. Area, 3995 square miles; pop. 442,626, 80 per cent. of whom are Poles. Hills occur in the north and on the banks of the Narew and Vistula, which with the Bug are the chief rivers. One-third of the surface is covered with forests, and there are many marshes and lakes. The inhabitants are engaged chiefly in agriculture, and in cattle and sheep breeding.

PLONGÉE, in Artillery and Fortification, means a slope towards the front. Thus, in speaking of the course of a shell through the air, its plongée is from the point of greatest altitude to the point at which it strikes the earth. So, in fortification, the plongée is the top of the parapet sloping gently towards the front. This slope is ordinarily 1 in 6; but a deviation is permissible of from 1 in 9 to 1 in 4: the sharper the slope, however, the more liable is the crest of the parapet to be destroyed by an enemy's fire. Moreover, as flat a plongée as possible is desirable, that sandbags may, when required, be laid upon it to form a cover for riflemen. See FORTIFICATION, fig. 7.

PLOTINUS, the most original and important philosopher of the Neo-Platonic School, was born at Lycopolis in Egypt 205 A.D.; but such was his utter indifference to things human, 'being ashamed almost to live in a body,' that he never would divulge even his parentage. He would never allow his birthday to be celebrated, although he gave feasts on those of Socrates and Plato; nor would he ever permit a painter or sculptor to perpetuate his features, or, as he called it, to produce the image of an image—the body being to him only a faint image of existence. He deemed it tedious enough already to have to drag about this image whithersoever he went in this life. His body was altogether contemptible in his eyes; he would see no physician in his illness, and was very sparing in the use of food, refraining from meat, often even from bread. Strangely enough, his desire for the study of philosophy did not arise within him before his 28th year, when he repaired to Alexandria, and there, after having sat at the feet of the great masters for some time without feeling satisfied with their teachings, he at last became acquainted with Ammonius Saccas, and in him found the desired teacher. For ten years he

zealously attended his lectures, and although he had agreed, with two of his fellow-students, never to make known aught of Ammonius's teachings to the world, he yet became the chief representative and author of that school, less as a pupil than as an independent thinker, who taking his stand upon its theorems, developed them to their full extent. In 242 he joined Gordianus's expedition to Persia, in order to devote himself to the philosophy of India and Persia; but the emperor being murdered in Mesopotamia, he had to repair hurriedly to Antioch, whence, in 244, he went to Rome. His lectures here were attended not only by crowds of eager youths, but men and women of the highest circles flocked to hear him. Not only Platonic wisdom, in Neo-Platonic garb, but asceticism and the charm of a purely contemplative life, were the themes on which he, in ever-new variations, and with an extraordinary depth and brilliancy, held forth; and such was the impression his earnestness made upon his hearers, that several of them really gave up their fortune to the poor, set their slaves free, and devoted themselves to a life of study and ascetic piety. Dying parents intrusted their children and money to him, well knowing that an honest guardian, and one more anxious for his charges, could not be found. It is hardly surprising to find that his contemporaries coupled with his rare virtues the gift of working miracles. Sixty years old, he thought of realising Plato's dream, by founding an aristocratical and communistic commonwealth like the latter's 'Republic;' and the Emperor Gallienus was ready to grant the site of two cities in Campania for his 'Platonopolis;' but his courtiers prevented the fulfilment of this promise. P. died from a complication of diseases, in 270, at Puteoli, 66 years of age.

Although he began to write very late in life, he yet left 54 books of very different size and contents. His MS. being very carelessly written, he asked his pupil Porphyry to revise and correct it for him. The latter also divided it into six principal divisions, each subdivided again into nine books or *Enneads*. The most important parts are those which treat of Beauty, Fate, Immortality of Soul, the Good or One, the Three Original Substances, of Free Will, against Gnostics, of Providence, of the Genesis of Ideas, of the Influence of the Stars, of the Supreme Good, &c. The language is very unequal in the different portions, according to the mood and circumstances to which they individually owe their existence; but it always is original, compact, and graphic in the extreme.

P.'s system was based chiefly on Plato's theorem of the Ideas; only that while Plato assumed the Ideas to be the link between the visible and the invisible, or between the Supreme Deity and the world, P. held the doctrine of Emanation, that is, the constant transmission of powers from the Absolute to the Creation, through several agencies, the first of which is 'Pure Intelligence,' whence flows the 'Soul of the World,' whence, again, the souls of 'men' and 'animals,' and finally 'matter' itself. (For a fuller account of this part of P.'s system in its historical connection, see NEO-PLATONISTS.) Men thus belong to two worlds, that of the senses and that of Pure Intelligence. It depends upon ourselves, however, to which of the two worlds we direct our thoughts most and belong to finally. The ordinary virtues, as justice, moderation, valour, and the like, are only the beginning and very first preparation to our elevation into the spiritual realm; purification, or the exercise of *purifying* virtues, is a further step, to which we attain partly through mathematics and dialectic; and the abandonment of all earthly interests for

those of intellectual meditation, is the nearest approach to the goal. The higher our soul rises in this sphere of intellect, the deeper it sinks into the ocean of the good and the pure, until at last its union with God is complete, and it is no longer thought but vision and ecstasies which pervade it. These are a few snatches of P.'s philosophical rhapsodies, to which may be further added his mysterious belief in a kind of metempsychosis, by which souls, not sufficiently purified during life, return after death, and inhabit according to their bent, men, animals, and even plants. He further held views of his own respecting gods and demons, whom he divided into different classes, according to their degrees; and professed faith in Mantic, astrology, and magic, the conviction of the truth of which sciences he derived from his theory of the harmony in the intellectual world, reflected by the material world. Yet it is clear from his dicta on these subjects that he did not believe in these so-called sciences in the gross sense of the herd, but that he had a vague knowledge of those mysterious laws of attraction and repulsion which go through nature. P.'s philosophy, which, as it were, tried to combine all the systems of Anaxagoras, Parmenides, the Pythagoreans, Plato, and Socrates, and the Stoa into one, was the last and boldest attempt of the ancient Greek world to explain the mystery of the creation and of existence. Its influence upon modern philosophy is remarkable. From Spinoza to Schelling, the reminiscences of P., irrespective of the drift of particular parts of their systems, recur constantly.

P.'s works were well-nigh forgotten, when Marsilius Ficinus first published a Latin paraphrase of them (Florence, 1492), which was followed by the *Ed. Pr.* of the original (Basel, 1580 and 1615). The first critical edition, however, is due to Creuzer (Oxford, 1835, 4to, 3 vols.). Parts of his works were translated into German by Engelhard (Erlangen, 1820, &c.); and into English by T. Taylor (1794 and 1817). The whole of the *Enneads* has been translated into French by Bouillet (Paris, 1861, 8vo. 3 vols.).

PLOTUS. See DARTER.

PLOUGH, PLOUGHING. The first in order and importance of agricultural operations is the breaking up of the soil, and this is accomplished, in all countries where agriculture is in an advanced state, by inverting the upper stratum of earth upon which the plants grow. Such a mode not only effectually accomplishes the required object, but buries and destroys all weeds, leaving the surface clean and unencumbered. The inversion of the upper stratum is effected by turning over successive sods or slices, of the length of the field, and of varying thickness and depth, according to the nature of the soil; and the implement employed for this purpose is the *plough*. The general form of the plough is known to every one, and to the unobservant eye, it appears to be a very simple and even primitive tool; nevertheless, much mechanical skill and ingenuity have been expended in perfectly adapting it to its work. It is a combination of instruments (fig. 1) fastened to a beam, GBL; the *coulter*, K, is an iron knife-blade, for cutting the sod vertically; the *share*, CFD, which is merely a socket fitted on and not fastened to the body of the plough, has a sharp point, C, and a projecting horizontal edge, CO, on its right-hand side, its part of the work being to separate the under-surface of the sod from the subsoil; by means of the *mould-board*, H, the slice, now wholly separated from the firm ground, is raised up and turned over by the forward motion of the plough; and the *stilt*, or

handles, one of which, BL, is a continuation of the beam, the other, M, being fastened partly to the former by rods, and partly to the lower portion of

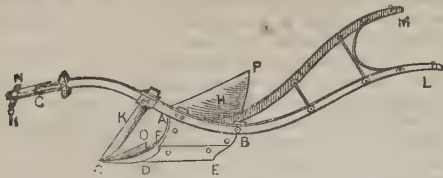

Fig. 1.

the framework (fig. 2, which also shows the point of the plough with the share removed), are for the purpose of guiding the implement. The front

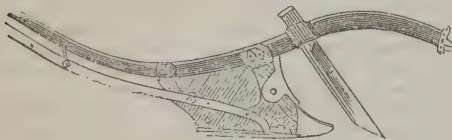

Fig. 2.

part of the beam is formed with an upward curve; at its extremity, is placed the *bridle*, N, to which the horses are attached by means of swing-trees and chains or traces, and the object of which is to enable the workman to elevate or depress the line of draught, or move it to the right hand or the left, as may be found necessary. The left sides of the coulter, share, and framework ADEB, should evidently be in the same vertical plane. The form of the mould-board is of the utmost importance, and has chiefly attracted the attention of agricultural machinists since the time when improvements on the plough were first projected. Its office being to raise and turn the sod, it is necessary that the surface should slope upwards and outwards from the front, so as to apply a pressure in both directions, and, accordingly, the surface is so shaped that from the point of the share, where it is horizontal, it gradually curves upwards, till, at the extremity, P, it inclines over away from the body of the plough. The gradual change produced on the position of the furrow-slice is seen in fig. 3, where ABCD on the left-hand side,

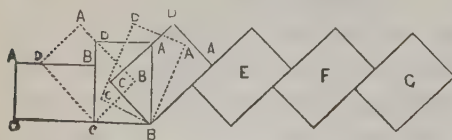

Fig. 3.

represents the slice untouched by the plough, AD being the line of section by the coulter; DC, by the share; BC, the open side from which the previous furrow (E) to the right-hand side has been separated; and the four successive rectangles, ABCD to the right, illustrate the successive changes of position of the furrow as the mould-board is pushed forward under and on its left side, till it is finally left, as represented in ABCD on the right hand; E, F, G are furrows which have previously been laid in their proper position. The advantages of laying the furrows in the position shewn are these: in the first place, the weedy side of each furrow being closely applied to the previous furrow, and kept pressed against it by

its own weight, the weeds are completely buried; secondly, the ridged surface thus presented, affords the means of covering the seed by harrowing; and lastly, the openings below increase the amount of surface accessible to air, and drain off superfluous water. The plough is wholly formed of iron; the share and the framework of malleable, and the mould-board of cast iron; while the coulter is frequently welded with steel on the right-hand side, the better to resist attrition. In most of the English (as distinguished from the Scotch) ploughs, wheels are attached at or near the front end of the beam, a contrivance which renders the implement more steady in its motion, more easily managed, and capable of doing better work in the hands of an inferior workman; but it is generally believed, in Scotland at least, that the plough without wheels, or *swing-plough*, as it is technically termed, is greatly more efficient in the hands of a thoroughly skilled ploughman. The usual dimensions of the furrow-slice in lea or hay-stubble are 8 or 9 inches in breadth by 6 in depth; and in land for green crop, 10 inches in breadth, and 7 or 8 in depth; though shallower ploughing is not unfrequently adopted, especially on thin soils.

Other kinds of ploughs are used for special purposes, such as *trench-ploughs*, which are made on the same principle as the common plough, but larger and stronger, so as to bring up a portion of the subsoil to the surface; *subsoil ploughs*, which have no mould-board, and merely stir and break up the subsoil, thus facilitating drainage; *double mould-board ploughs*, which are merely common ploughs with a mould-board on each side, and are employed for water-furrowing, or for earthing up potatoes, &c. Of each of these ploughs, there are many varieties, each maker having generally some peculiar views regarding the form and proportion of some parts or the whole of the instrument, and this is specially the case at the present time, when competition between makers has become so active. For those who wish to study minutely the best form of plough, it will be necessary to consult works on agriculture and agricultural implements. There is, however, one very peculiar form of plough much used in various parts of England, which deserves more particular notice; this is the *turn-wrest plough*. Its chief peculiarity is, that instead of one, it has two mould-boards, one on each side, and these are alternately brought into operation, so that the furrow is always turned over in the same direction. The mould-boards are firmly fastened together in front, and kept at a constant distance from each other behind, by means of struts, while the handles are movable with reference to them; the mould-board which is intended to be used being pushed away from, and the other (which for the time does the same work as the vertical surface ADEB in fig. 1) brought nearer to the line of the beam; of course, when the next furrow is ploughed, the mould-boards exchange adjustments. This form of plough is very useful in

Fig. 4.

ploughing along a hillside, as by it all the furrows can be turned over towards the hill, thus preventing the natural tendency of the soil to work itself

downwards, leaving the upper portions bare. The form (fig. 4) here given is the rudest and least desirable form of the turn-wrest; it is that which is used in Kent, and there much esteemed.

The operation of ploughing we can only notice briefly. The usual breadth of a ridge being taken as 18 feet, the ploughman sets up a line of poles along the middle of the first ridge, to guide him in a straight line. Along this line marked with poles he drives his plough, throwing out a furrow, and after reaching the headland,* turns his horses, and returning on the same track, throws out a furrow on the opposite side. He then enters his plough on the left side of the double furrow, at a distance of 8 to 10 inches, according to circumstances, and throws back the furrow previously thrown out on that side; returning by the other side, and doing the same with the other thrown-out furrow. This process is termed *feering*. He has now two furrows turned up and leaning against each other, and he then proceeds to add furrow to furrow on each side alternately of the first pair, till a whole ridge is completed; or he may (which is the preferable plan) plough the inner half of the first ridge and the first half of the second ridge. This process is termed *gathering*; and a repetition of it on the same land, *twice-gathering*; but this is only practised on strong wet land.

Cleaving is the opposite to gathering, the furrows in the former case forming the centre of the ridge of the latter, and the position of all the furrows being reversed. *Casting* or coupling ridges is now by far the most common method of ploughing, and consists in the formation of ridges of 36 feet, or twice the usual width, the first feering being made close along the side of the field, and the next at a distance of the width of two ridges, and so on.

The first essential property of every plough is, that it shall throw the furrow cleanly off the mould-board; the next, that it shall lay it in that position which best exposes the soil to the action of the air, hence care must be taken that the mould-board be neither too long nor too short, as in the former case it plasters up the surface of the furrow, and in the latter destroys its form.

The plough is one of the most ancient of implements, and is mentioned in the Old Testament at a

instances consisted of little more than a pointed stick, which was forced into the ground as it was drawn forward. In fact, the earliest ploughs were neither more nor less than varieties of the *Hoe* (q. v.), worked by pressing the point into the ground instead of by percussion.

The earliest form of the Greek plough, the *autogon* (fig. 5, a), is an example of this; it was merely the trunk of a small tree, which had two branches opposite to each other, one branch forming the share and the other the handle, while the trunk formed the pole or beam. The more improved form, the *pektion*, in use among the Greeks, was not substantially different from the modern form in use in Mysia (fig. 5). The ancient Egyptian plough in one of its early stages is represented in fig. 6, and, like the two forms above described, is devoid of all apparatus enabling the labourer

Fig. 6.

Fig. 7.—Modern Syrian Plough.

to guide it, all that he can do being to press (by his weight applied to the handle) the share into the earth. The Egyptians, however, gradually improved the form, till it assumed the appearance of a hollow wedge formed by the two handles joined at the bottom, and with the beam fastened between the handles a little above their point of junction. The share was the point of the wedge, and the handles were placed almost upright; this is in all essential particulars the 'araire' still used in many rural districts of France, and also corresponds very closely to the modern Syrian plough (fig. 7). The Romans, an essentially practical nation, largely improved on the plough, adding to it the coulter and mould-board, and occasionally attaching wheels to the beam to prevent the share from going too deep into the earth (fig. 8). A later and more improved form, in which the handles were made to incline backwards and the coulter was placed so far back as to be directly above the share, is still in use in the north of Italy. The ploughs used in the present day in most other parts of the continent are equally rude and inefficient with the French and Italian implements. The plough was almost unknown among the American aborigines, though Prescott describes a mode of ploughing practised among the Peruvians, which consisted in the dragging forward of a sharp-pointed stake by six or eight men, its sharp point, which was in front, being kept down in the ground

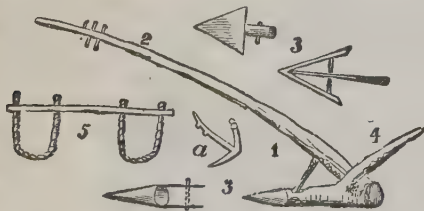

Fig. 5.

very early period, iron shares being also incidentally noticed more than seven centuries B.C. The ancient Egyptian plough was wholly of wood, and in some

* The headlands or head ridges are two ridges, one along the top, and one along the bottom of the field, which are not ploughed till the rest of the field has been completed.

by the pressure of the foot of another man who directed it. Britain and America, and their colonies, are the only countries in which the plough has been

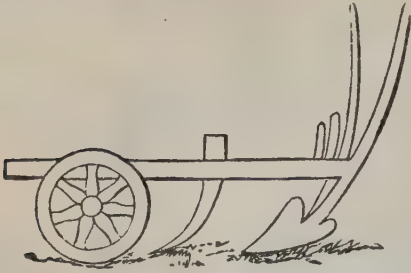

Fig. 8.

brought to a state worthy of being considered effective, and even in Britain the most important amendments on it are not two centuries old. England took the lead in improvement by rendering the form more neat and effective, and by attaching wheels to aid in keeping the plough in a proper upright position. In Scotland, for some time after this, the plough was extremely rude and cumbrous, and usually drawn by 8 oxen; but in the middle of the 18th c., some Dutch ploughs were imported, and being found more effective, an impetus was thus given to attempts at improvement. James Small, who may justly be regarded as the real inventor of the Scotch or swing-plough, made great and important changes in the form and efficiency of the coulter, share, and mould-board, producing an implement at once lighter and vastly more efficient. All the swing-ploughs of successive makers are founded upon the basis of Small's plough. Wilkie of Uddingston (Lanarkshire) formed it wholly of iron, and his modification has been universally adopted in the modern ploughs. Among the various improvers of this form of cultivator may be mentioned, besides Wilkie of Uddingston, Gray of the same place, Clarke of Stirling, Cunningham, Barrowman, Ponton, Sellars, &c. In England, swing-ploughs are occasionally met with, but the wheel-plough is the one generally used; like its Scotch neighbour it had many defects, which have been gradually remedied, chiefly by Ransomes of Ipswich (the patentee in 1785 of the cast-iron share), Howard of Bedford, Hornsby of Grantham (Lincolnshire), and Busby of Bedale, the last of whom gained a medal for his mould-boards at the Great Exhibition of 1851. The English and Scotch ploughs differ from each other in many important particulars, especially in the form of the mould-boards and in the adjustment of the coulter, the first being chiefly adapted for shallow, and the latter for deep, ploughing. In the Cotswold district, a plough constructed of wood, and with a wooden mould-board (the *Beverstone Plough*), is in general use, and is found sufficiently well adapted for the shallow ploughing there practised. For further information concerning the plough and the mode of using it, see Morton's *Cyclopædia of Agriculture* (1856), Stephens' *Book of the Farm*, *Book of Farm Implements*, by Henry Stephens and R. Scott Burn, and other works.

Steam-ploughing.—Although it is not yet ten years since cultivation of the land by steam came into successful operation, it is about two centuries and a half since it was foreseen to be possible. So long ago as 1618, David Ramsey and Thomas Wildgosse took out letters-patent for engines and machinery to plough the ground without the aid of oxen or horses; and nine years

afterwards, other ingenious men obtained letters-patent for machines to effect a similar purpose. It is the opinion of Mr Woodcroft of the Patent Office, who compiled the *Abridgments of the Specifications Relating to Steam-culture*, that steam was the motive power intended to be employed; but as the first patent was taken out nearly 40 years before the Marquis of Worcester described the steam-engine in his *Century of Inventions*, the grounds for such an opinion do not seem quite satisfactory. In 1769, however, after the steam-engine had been applied to other purposes, there was lodged in the Patent Office a specification for a new machine or engine, to plough, harrow, and do every other branch of husbandry, without the aid of horses. The patentee was Francis Moore; and so confident was he of the merits of his plan, that he sold all his own horses, and persuaded his friends to do the same; 'because the price of that noble and useful animal will be so affected by the new invention, that its value will not be one-fourth of what it is at present.' Moore, however, was much too sanguine; his method of cultivating the land without the aid of animal power failed, as those of others before him had done.

The next invention that it is here necessary to mention was one by Major Pratt, patented in 1810. His plan was to have two engines, one on each headland, drawing, by means of an endless rope, an implement between them. In order to save the labour and loss of time in turning the plough at the ends, he attached two ploughs, back to back, making them work upon a fulcrum in the centre of a frame, so that one could be raised out of the ground when the other was working. This was the first adoption of the balance-principle, now employed in most implements used in steam-cultivation. Major Pratt's apparatus, like those of his predecessors, never came into practical operation.

In the interval between 1810 and 1832, when Mr Heathcoat, M.P., a Tiverton lace-merchant, patented the first steam-ploughing machinery that ever wrought successfully in the field, there were many inventions, but these being of little utility, need not be particularised. Mr Heathcoat's machinery was principally intended for draining and breaking up soft or swampy land. It consisted of a locomotive steam-engine, with a broad, endless, flexible floor or rail, by attached to the wheels, so as to prevent them from sinking in the boggy soil. Opposite to this engine an auxiliary carriage was placed, and between the two the plough was drawn backwards and forwards by an endless chain or band—engine and carriage moving along as the work proceeded. In 1836, this plough worked with tolerable success in Red Moss in Lancashire, and in 1837 it was tried near Dumfries, under the auspices of the Highland and Agricultural Society of Scotland; but here its performance, though in some degree satisfactory, was not sufficiently so to warrant the judges in awarding to it the prize of £500, which had been offered for the first successful application of steam-power to the cultivation of the soil by the Society. The apparatus was very cumbersome and expensive to work, the engine being 25 horse-power, and the number of men and boys employed in the operation no less than ten. The amount of work done was at the rate of 8½ acres per day. Mr Heathcoat abandoned the machine after having spent about £12,000 on it.

After Mr Heathcoat, the inventors specially worthy of mention are Alexander M'Rae, who, arranging his motive-power in the same manner as Major Pratt, made the important addition of a barrel to the plough-frame upon which the slack-rope was to be wound up; Mr Hannam of Burcote, who, in 1849, designed an apparatus to be driven

by an ordinary portable engine, to be stationed at the corner of the field, which was surrounded with wire-ropes in the same way as will be afterwards described in Howard's method; and Mr Tulloh Osborn, who, in 1846, patented a plan for two engines running opposite each other on the headlands, having two drums fixed to them, one for the winding of the tight, and the other for letting out the slack, gear. This apparatus was tried by the Marquis of Tweeddale for some time at Yester; but it was found, in consequence of the great power required, and other defects in detail, to be very expensive, and was ultimately given up. To the Marquis of Tweeddale, therefore, belongs the honour of being the pioneer of steam-cultivation in Scotland.

In 1855, the Messrs Fiskien of Stamfordham, Newcastle-upon-Tyne, took out a patent for a much more perfect apparatus for cultivating the land by steam than any that had previously appeared. The power was transmitted by a stationary engine to a hempen rope (the Messrs Fiskien being anxious to dispense with wire-ropes), which was worked at a high velocity, and, passing round pulleys on two self-moving anchors, turned a drum upon the plough, whose revolution imparted motion to the implement upon which it was fixed. The important features in this system were the self-propelling anchors, the arrangement of the ploughs on the balance-principle, and the mode of steerage. This plough was exhibited at the annual show of the Royal Agricultural Society of England in the year the patent was taken out, and excited great interest, but failed to obtain any award. Three years before this, the Highland and Agricultural Society of Scotland had thought so hopefully of the idea, that a grant was voted out of its funds to assist the author in maturing his project.

In 1854, Mr Fowler exhibited his patent steam-draining apparatus at the Lincoln meeting of the Royal Agricultural Society of England; and from this time may be dated the practical history of cultivation of the land by steam; for the idea that such an apparatus could be wrought advantageously in other field-operations entered the mind of a practical farmer, Mr Smith of Woolston, near

Bletchley; and under the direction of Mr Fowler, he got constructed an apparatus, which, with modifications, he has been working successfully ever since.

The inventions since that time need not be enumerated. It may be stated generally that they have included plans for engines travelling over the surface of the ground, drawing ploughs or other cultivating implements along with them; engines working on tramways, and drawing implements after them; engines moving along opposite headlands, and working implements between them by means of wire-ropes, and stationary engines driving implements also by means of wire-ropes. The first two principles have been abandoned—the one on account of the great consumption of fuel, and the large amount of wear and tear occasioned to move the engine over uneven and soft ground; and the other, on account of the expense necessary to lay down rails over a farm. The only two systems in practical operation are what are called the direct and round-about—the former where the pull of the implement is directly to and from the engine; and the latter where the implement is drawn at right angles.

These methods are best known as Fowler's and Howard's, though, perhaps, Smith should be credited with the round-about system, but Howard's name is now much more generally given to it.

Fowler's system we hope to make intelligible by the aid of cuts. The principal elements are an engine, an anchor, a wire-rope, and a balance-plough. In commencing operations, the engine is placed at the end of one of the headlands of the field, and directly opposite it on the other headland is placed the anchor. Beneath the engine there is a large sheave or drum, five feet in diameter, the groove of which drum is composed of a series of small leaf-like pieces of chilled cast-iron, each moving independently upon its own axis. The object of these is to prevent the rope from slipping (which it is apt to do in a plain groove under great strain), and this they do in a very ingenious manner, by closing on the rope as soon as it takes the bend—that is, as soon as the rope presses upon them—and they in the same manner open and release it immediately on the pressure

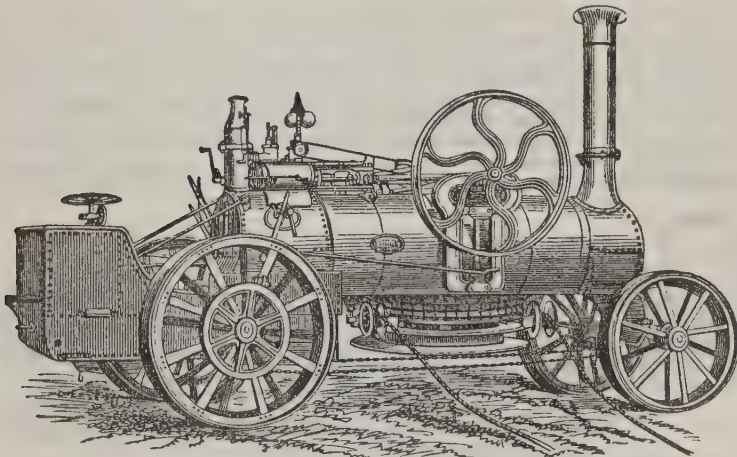

Fig. 9.—Fowler's Steam-engine.

being removed, or, in other words, as soon as the rope resumes the straight on the other side of the sheave. The position and nature of this drum on the engine will be understood by the accompanying cut. The

anchor, as will be seen from the engraving (fig. 10), is a massive square framework of wood, mounted on six sharp disc wheels, each about two feet in diameter, which cut deep into the ground, and on the lightest

PLOUGH, PLOUGHING.

land they take such hold as effectually to resist the pull of the rope which is passed round the sheave beneath. The anchor has a self-acting motion—

the power being communicated from the engine through the medium of the ploughing-rope—which enables it to move along the headland, and

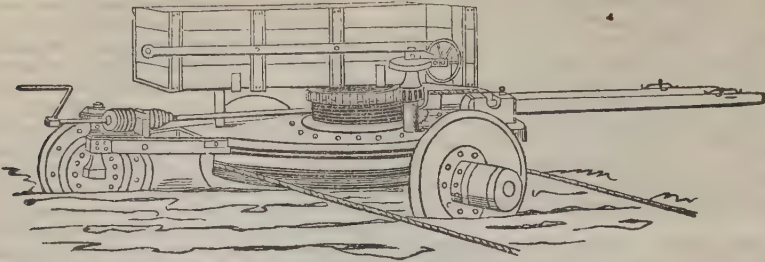

Fig. 10.—The Anchor.

keep opposite to the engine. The plough (fig. 11) is a framework of iron, balanced upon two large wheels. To each side of this framework there are attached four plough-bodies and coulter, so that four furrows are cut at one 'bout,' and the headland on which the anchor is stationed being reached, the end of the beam that was out of the ground is depressed (the other, of course, being raised), and the four plough-bodies that were out of the ground, and which point in the opposite direction, are

inserted in the soil, and turn up the furrows on the way back to the engine. By altering the position of the plough-bodies along the frame-work, a broad or a narrow furrow can be cut at pleasure. In ordinary working, an acre an hour is accomplished. The wire-rope, by which the plough is dragged through the land, passes round the sheaves on the anchor and the engine, the ends are attached to two drums upon the plough; and by a nice mechanical arrangement, the ploughman who rides

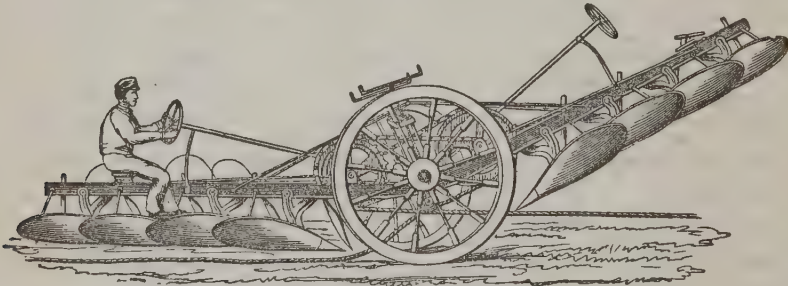

Fig. 11.—Fowler's Plough.

upon the implement is enabled to wind up, or let out slack if necessary, without loss of time. The wire-rope is made in lengths, which are easily disjoined, in order that it may be adjusted to irregularly shaped fields, or rather to fields that are not exact squares or parallelograms; for Fowler's method is not well adapted to such irregularities as prevent the engine and anchor being opposite each other. The rope is borne off the ground—a very

necessary precaution, without which the wear and tear would be alike annoying and expensive—by a number of pulleys, or 'rope-porters' as they are called, mounted on frames. The outside ones, that is, those farthest from the work, are moved along by the action of the rope; those in front of the plough are removed by boys, and placed behind the implement as it proceeds. The *modus operandi* will be patent at a glance, from the annexed plan or

Fig. 12.—Fowler's Anchor, Engine, and Plough at work.

working (fig. 12). To manage this apparatus three men and two boys are required—namely, a man at the engine, another on the plough, a third at the anchor, and the lads to look after the rope-porters. The water and coals needed for the engine must be brought by other men.

The plough-bodies can be removed from the frame, and in their place 'digging-breasts' be attached, by means of which the land is thrown up in a somewhat similar manner to that in which it is turned over by the spade. The price of the ploughing and cultivating apparatus is as follows: 14-horse

power double-cylinder engine, with self-moving and reversing gear, with tank, steerage, 20-inch wheels, clip-drum, 150 yards headland rope, snatch-block, spuds, tools, and tool-box, complete for steam-cultivation, £614; self-moving anchor, with six discs, lifting jack, headland ropes, and all tools complete, £55; four-furrow balance-plough, fitted with slack gear, digging and scarifying breasts, £97; 800 yards best steel rope, fitted with eyes and joints, £84; 10 large, and 10 small, rope porters, £25. Total, £875. Of course, in the case of an engine of less horse-power being required, the price is proportionately lower. At the Newcastle show of the Royal Agricultural Society, in July 1864, Mr Fowler introduced two engines of 7-horse power, working simultaneously on opposing headlands. The expedition with which these engines were set down to and completed their work was a matter of admiration to all present, and the subject of special remark by the judges. These gentlemen say: 'The engines worked smoothly; and so far as we could ascertain, appeared to bear an equal share of work in either direction.' They got up steam in nearly half an hour less time than the 14-horse engine, and working with them, much less time was required to arrange the tackle. 'The engines were masters of their work; and acting in combination, appeared to

possess more power than the large engine and anchor. . . . The advantages of this system appear to be, that horses are not required to move tackle; that there is a saving of time in setting down, taking up, and removing from field to field [no unimportant consideration]; and that the two small engines are both available for ordinary farm-work, such as thrashing, driving, barn-work, &c.' The cost of the two engines, with their apparatus, is £1066. The number of hands employed is the same as at the large anchor and engine; but as a skilled labourer is necessary where only an unskilled labourer is needed in the latter case, the cost per day is 2s. more; working the large engine and anchor, including the cartage of water and oil, is estimated at 16s. per day; the two engines at 13s. Fowler has been most successful in carrying off the prizes at all the competitions of steam-ploughs, having received in this way, since 1856, nearly £3200, besides gold medals.

Howard's system consists in a stationary engine driving a windlass, having two winding drums, with direct and reverse action, placed in front of it, round which is coiled about 1600 yards of wire-rope. By a simple lever movement, the man can drop the winding drums out of gear in an instant, a contrivance which enables him to attend to the proper

Fig. 13.—Howard's General Plan.

coiling of the rope, and also to arrest, in case of accident, the plough in a moment, without stopping the engine. The engine is usually placed at the corner of the plot to be ploughed, the rope is carried round the field on rope-porters, and fixed at the corners by light anchors. A snatch-block placed in front of the windlass prevents the slack-

rope running out too fast, and trailing on the ground. The plan of working given clearly illustrates the arrangement (fig. 13). The plough, as will be seen from fig. 14, is composed of two strong iron frames balanced upon four wheels, and crossing each other at their inner ends, thereby decreasing the length of the plough, and, as a matter of course, the

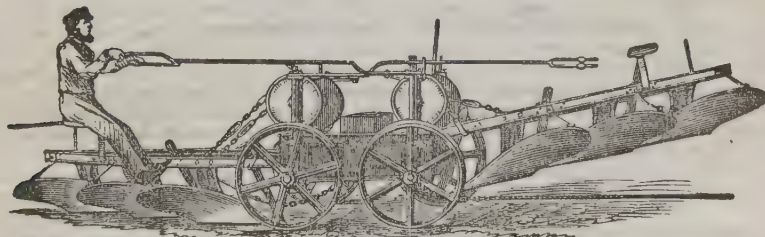

Fig. 14.—Howard's Plough.

breadth of the headland. The frames are raised and lowered in such a manner that the set of ploughs out of work is independent of, and has no

tendency to weigh or raise out of the ground the set in work. The frames are made for two, three, or four furrows, and 'diggers' or scarifiers can be

attached the same as in Fowler's. It should be mentioned that the Messrs Howard prefer the cultivator, that is, a machine to smash up the land rather than the plough, and the plough is not included in the cost given below. In this method the plough is not pulled direct between engine and anchors, but at right angles to the engine—between one anchor and another, the anchors being removed inwards by manual power, and nearer the engine every time the field is traversed by the plough. With this system there are five men and two boys required; viz., a man at the engine, another at the windlass, a third on the plough, two at the anchors, and the boys to look after the rope-porters. The cost of this apparatus—which, exclusive of engine, consists of the patent windlass, 1600 yards of patent steel wire-rope, universal joint, for connecting the windlass with engine, patent double-action steam-cultivator, with five tines, patent double snatch-block, with arrangement for slack-rope, anchors, single snatch-blocks, rope-porters, &c.—is £250; and a 10-horse portable engine is £295; making the whole £545. The cost of working this apparatus, including water-cart, and boy, and oil, is 20s. 6d. per day.

In Coleman's system, the drums upon which the rope is wound are attached to the sides of the engine, and give out and take on rope alternately. The engine moves along the headland; and the anchor, upon which there is very little strain, and which is, therefore, a very light, portable article, is shifted opposite to it by a man as the work is performed; direct action being obtained here, as in the case of Fowler's. The peculiarity of the plan consists in having two implements instead of one at work, the implements being grubbers, which smash up the ground—a practice now adopted by some farmers in England, in preference to turning the sod over with the plough. On commencing operations on this plan, the field is divided into two equal parts. The cultivators or grubbers work only one way—towards the engine. They are attached by the front to each end of a strong wire-rope, while a smaller wire-rope is fastened to their rear. The one cultivator is placed at the far side of the field, where its teeth or 'tines' are inserted in the ground; and it is pulled towards the centre of the field, tearing up the soil as it comes, the other meanwhile going out empty to meet it. When the latter reaches the middle of the field, the action of the engine is reversed, and it is dragged back to the engine, cultivating the land as it travels, while the other goes back to the headland empty. The pull out empty and working in is, of course, continued until the whole land has been tilled.

The other systems before the public are in principle the same as those described, though they are variously modified in detail.

With regard to the merits of each, it may be stated as the general opinion that Fowler's is the best for large fields. Moving along the headland, and propelling its anchor along with it, this apparatus could cultivate a field of from 350 to 400 yards in breadth, and of any length, without requiring to be shifted. Its direct action also secures that there is as little waste of power as possible. The advantages of saving time and conserving force, which these two features secure, can hardly be over-rated.

Howard's system seems to be regarded as most desirable where fields are small and irregularly shaped, as the rope can be so disposed as to enable the cultivating implement to reach almost any angle. The engine may be so placed that 40 or 50 acres may be cultivated without moving it; but the anchors, pulleys, rope-porters, &c., must be

shifted after the completion of every ten or twelve acres, and thus a considerable time is lost. There must also be some little waste of force in dragging so much rope and the implement at right angles to the engine. By this method, however, a trifling saving of water-carriage could be effected as compared with Fowler's, by having tanks at the engine-stations.

With Coleman's method, there is a little time saved at the ends in comparison with the other two, and there is also some economy in the purchase of the rope; but then there is loss of power in pulling an empty implement half through the field, and a necessary wear and tear of rope in dispensing with rope-porters, and allowing the wire to trail upon the ground.

By all the apparatus, however, tillage is much more perfectly and even cheaply performed than by horse-labour. As a rule, about three-fourths of an acre to an hour can be cultivated with either Fowler or Howard's apparatus. Where soil and climate are so variable as they are in Great Britain, it would serve no good purpose, but would be rather misleading, to name a price per acre at which steam-ploughing can be effected; but the following general statements in its favour may safely be made. That the use of the steam-plough or cultivator enables the farmer to perform his tillage operations at the best season of the year, and to free his land more quickly and effectually from weeds. Tenacious soils are rendered more friable and porous, and good drainage promoted by the efficient manner in which the subsoil can be stirred by the aid of steam. The steam-cultivator, plough, or harrows, may be frequently worked to advantage in an unfavourable season, when it would be impossible to work with horses. And not only a considerable diminution in the number of horses employed can be effected, but the horses, which are still necessary, can be kept at less expense. Consequently cultivation by steam-power, besides being more excellent, is actually cheaper, monetarily considered, than that done by horses.

There are at present about 800 or 900 steam-ploughs at work in Great Britain, and the demand for them is yearly increasing. Mr Fowler is now turning out of his Leeds' establishment about six engines with their appurtenances per week; and the Messrs Howard have also large demands. Many are exported to the continent, to the West Indies, to Egypt, and the East Indies.

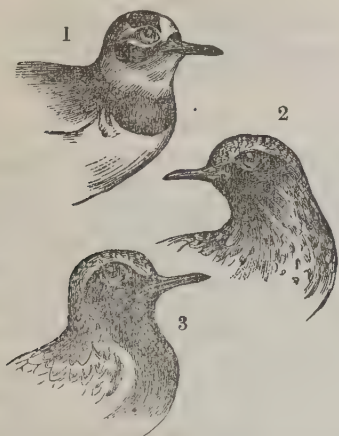

PLOUGHGATE OF LAND, in the Law of Scotland, is an expression denoting a quantity of land of the extent of 100 acres Scots. No person is qualified to kill game in Scotland who has not a ploughgate of land, and this is still the law. Paterson's *Game-laws of United Kingdom*, p. 158.

PLOVER (*Charadrius*), a genus of birds of the family *Charadriade* (q. v.), having a straight compressed bill; the upper mandible alone slightly inflated and slightly bent at the point; the nasal groove extending about two-thirds of the length of the bill, the nostrils longitudinally cleft near the base; the legs not very long, naked a little above the tarsal joint; no hinder toe; the wings rather long and pointed, the first quill-feather the longest. The species are numerous, and are found in every quarter of the globe; many of them are birds of passage. They chiefly frequent low moist grounds, where they congregate in large flocks, and feed on worms, molluscs, insects, &c.; but some of them visit mountainous regions in the breeding-season. They fly with great strength and rapidity, and run with much swiftness. The flesh and eggs of many of them are esteemed delicacies. One of the British

species is the Dotterel (q. v.). Another is the GOLDEN P., YELLOW P., or GREEN P. (*C. phœnalis*), a rather larger bird, of a blackish colour, speckled with yellow at the tips and edges of the feathers; the throat, breast, and belly black in summer, whitish in winter. The Golden P. is a bird of passage, visiting in summer the northern parts of Europe, of the west of Asia, and of North America; and migrating to the south in winter. It is known in almost all parts of Europe, and is common in many parts of Britain, breeding in the northern parts. Great numbers frequent the sandy pastures and shores of the Hebrides and of the Orkney and Shetland Islands. It makes an artless nest, little more than a slight depression of the ground, and lays four eggs. The parent birds shew great anxiety for the protection of their young, and use various stratagems to divert the attention of an enemy. The Golden P. exhibits great restlessness on the approach of wet and stormy weather, whence its specific name *phœnalis*.—The RINGED P. (*C. hiaticula*), a much smaller bird, not so large as a song

visitant. Its geographic distribution extends over most of the northern parts of the world.

PLUM (*Prunus*), a genus of trees and shrubs of the natural order *Rosaceæ*, suborder *Amygdalæ* (q. v.) or *Drupacæ*; the species of which have the stone of the fruit sharp-pointed at each end, with a longitudinal furrow passing all round, and a smooth surface; the fruit covered with a fine bloom, and the young leaves rolled up. The Common P., the Bullace, and the Sloe, are generally reckoned by botanists as distinct species, but with much doubt if they are really distinct, as the P. passes into the Bullace, and the Bullace into the Sloe by insensible gradations; although there is so wide a difference in general appearance, size of leaves, and size as well as quality of fruit, between the best cultivated plums and the sloe, that it is not without an effort we can imagine them to have sprung from a common stock. The Common P. (*P. domestica*) appears in a wild state in woods and hedges in many parts of England and on the continent of Europe; probably, however, often derived from the seeds of cultivated trees. It is commonly described as destitute of spines, and as further differing from the bullace in having the under-side of the leaves smooth except when they are very young; but if these characters are adopted, many of the cultivated plums must be referred to the bullace (*P. insititia*) as their original; nor does the ovate fruit afford a more certain character, some of the finest garden plums being globose or nearly so, like the bullace. The varieties called Damson (q. v.) are particularly like the bullace, except in the form of the fruit. Cultivated plums vary greatly in the size, form, colour, and flavour of the fruit. The fruit of some varieties, as the *White Magnumbonum*, is two inches long; while damsons of the same shape are not quite one inch, and a single fruit of the one is equal to at least eight or ten of the other. The best varieties of P. are among the most delicious dessert fruits; among these, the *Green Gage* (*Reine Claude* of the French) is one of the most esteemed both in Britain and on the continent of Europe; and is unsurpassed both in sweetness and flavour. The inferior varieties are used in pies, conserves, and sweetmeats. Some of them are very austere. In moderate quantity, plums are wholesome enough; but excess in the use of them is very apt to produce colic, diarrhœa, and cholera. The danger is greater, if they are eaten before being perfectly ripe. A very pleasant wine is made from plums; and in some parts of Europe a strong spirit is distilled from them after fermentation; but for this purpose they are mixed in the south of France, with honey and flour, and in Hungary with apples.—The dried fruit, variously known as *Dried Plums*, or *French Plums*, and *Prunes* (q. v.), is much used for the dessert; and the somewhat austere fruit of the *St Julien Plum*, cultivated in the south of France, becomes, when dried, the medicinal prune, used as a mild laxative. The drying of plums is effected very slowly in ovens, by a heat which is gradually increased. The process requires great care. The prunes called *Brignoles* are the produce of a variety grown principally near the little town of Brignole in Provence. The P. has been in cultivation from ancient times, and the first fine varieties were probably introduced into Europe from the East. The finer varieties are propagated chiefly by budding on stocks of the coarser kinds, which are procured either from seed or as suckers from the roots of P.-trees. The coarser varieties are propagated by suckers, without budding. A free loamy soil is best for plums. They are grown as standard, espalier, or wall trees. As standards, some

1, Ringed Plover; 2, Gray Plover; 3, Golden Plover.

thrush, is found at almost all seasons on the shores of the British Islands, frequenting sandy and shingly flats, from which the sea retires at ebb-tide. It is often to be seen also on the banks of large rivers, and not unfrequently of lakes and ponds. It is found in most of the northern parts of Europe and Asia, and in Iceland and Greenland. It is grayish-brown above, whitish beneath, with a collar of white round the neck, and below it a black—in winter, a brown—collar; the head marked with black and white; a white bar on the wing. Very similar, but smaller, is the KENTISH P. (*C. Cani-anus*); and also similar and of similar habits is the smallest of the British species, the LITTLE RINGED P. (*C. minor*). Both of these are rare in Britain.—North America has a number of species of P., one of which, the AMERICAN GOLDEN P. (*C. Virginianus*), very closely resembles the Golden P. of Europe; and another, the KILDEER P. (*C. vociferus*), abundant on the great western prairies, and not unfrequent in the Atlantic states, utters, when approached by man, a querulous or plaintive cry, like the lap-wing.—The name P. is often extended to species of *Charadriacæ* belonging to other genera, as *Squatarola*, in which the nasal grooves are short, the tip of the bill is tumid, and there is a rudimentary hind-toe. To this genus belongs the GRAY P. (*S. cinerea*) of America, a species rather larger than the Golden P., and chiefly known as a winter

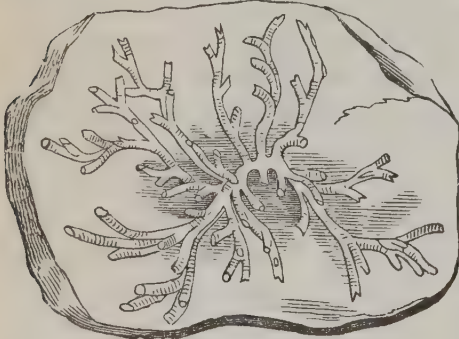

the varieties attain a height of more than 20 feet, with a moderately spreading head. The fruit is mostly produced on spurs; but some of the finest fruit on the shoots of the former year. Among the varieties of *P.* are some which ripen their fruit early, and others which ripen late in the season. The cultivated varieties are very numerous, many of which, most esteemed in the United States, are of American origin, such as the Washington, Hulings' Superb, Bleeker's Gage, Jefferson, McLaughlin, Prince's Yellow Gage, &c.—The CASHMERE *P.* (*P. Bokharensis*), cultivated in Cashmere and Bokhara, is regarded as a distinct species.—The CHERRY *P.*, or MYROBALAN *P.* (*P. cerasifera*), is a bush very similar to the sloe, with pendulous globular red fruit. It is a native of North America.—The CHICKASAW *P.* (*P. Chickasa*) is found in Kentucky and Illinois, &c.—The BEACH *P.* (*P. maritima*) is a shrub indigenous to sandy soils on the seacoast of N. America from N. Jersey to Carolina. It has a dark purple agreeable fruit, about the size of a pigeon's egg.—BLACK THORN (*P. spinosa*) occurs on roadsides and waste places in New England, Pennsylvania, &c.

The COCOA *P.* or ICACO of the West Indies is the fruit of *Chrysobalanus icaco*, a tree of the natural order Rosaceæ, suborder Chrysobalanæ. The fruit resembles a *P.*, has a sweet although slightly austere taste, and is eaten both raw and preserved.—The fruit of *Parinarium excelsum*, another of the Chrysobalanæ, is called Gray Plum at Sierra Leone.

PLUM, DATE. See DATE PLUM.

PLUMAGE OF BIRDS. See BIRDS and FEATHERS.

PLUMATELLA, a genus of zoophytes (*Polysa*), having the polypidom fixed, membranaceous, cœva-like, and branched; the polypes issuing from

Plumatella Repens.
(From Johnston's British Zoophytes.)

the extremities of the branches, with a crescent-shaped disc surrounded by a single series of many tentacles. The species are found in fresh water, attached to stones, &c. *P. repens* is a common British species, sometimes spreading over a square foot, and having branches three inches long, which adhere to some surface throughout almost their whole length. The tentacles are beautifully feathered with cilia on two opposite sides.

PLUMBAGINEÆ, or PLUMBAGINACEÆ, a natural order of exogenous plants, herbaceous or half-shrubby; with leaves somewhat sheathing at the base, and often clustered; flowers in panicles or in heads; calyx tubular, persistent, plaited; corolla very thin, of one or five petals; stamens five; ovary superior, 1-celled, with a solitary ovule; styles generally five; fruit a Utricle (q. v.). There are about 160 known species, chiefly found on the sea-shores and in the salt marshes of temperate

regions. Some are found also in elevated regions, in all zones. Many have flowers of great beauty, and are therefore favourites in gardens. Some are occasionally used in medicine as tonics and astringents; others, being exceedingly acrid, as vesicants, particularly species of *Plumbago*.

PLUMBA'GO. See BLACK LEAD.

PLUME-BIRD. See SUPPLEMENT in Vol. X.

PLUMED MOTH, the popular name of a group of 'Nocturnal Lepidoptera,' known to entomologists as *Fissipennæ* and *Pterophorites*; remarkable for having at least a pair of the wings, and often all the wings, longitudinally cleft into two or more—sometimes six—divisions, which are beautifully fringed at the edges. The wings are similar to those of other moths in their nervures, but the membrane

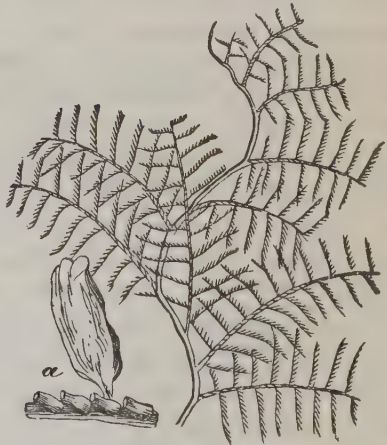

Plumed Moth.

which usually connects the nervures is interrupted. The Plumed Moths are extremely beautiful, but often pass unobserved in consequence of their small size. Some of them have the power of folding up the wing like a fan. Although they are ranked among the Nocturnal Lepidoptera, some of them fly about during the brightest part of the day.

PLUMMET, a weight of lead hung on a string, and attached to a frame, for the purpose of shewing the vertical line.

PLUMULARIA, a genus of zoophytes (*Anthozoa*); plant-like, rooted, simple, or branched; with feathery shoots and offsets; and having hydra-like polypes in small cells arranged on one side of

Plumularia Falcata (natural size):

a, the ovarian vesicle and four of the polype-cells of *P. falcata*, magnified. (From Johnston's British Zoophytes.)

the shoot or branch, usually in the axil of a horny spine. The species are numerous, inhabitants of the sea, some of them very common on the British coast,

attached to stones, shells, sea-weeds, &c. They are very beautiful objects, even as seen by the naked eye, and still more when examined by the microscope; combining great delicacy with the utmost elegance. The polypes in a single *P.* are often exceedingly numerous; those of *P. falcata*, a very common British species, often to be found at low-water mark, have been calculated as 80,000 or 100,000 in number.

PLUMULE See SEED.

PLURALISM, in Canon Law, means the possession by the same person of two or more ecclesiastical offices, whether of dignity or of emolument. Pluralism has been held unlawful from the earliest times, and is forbidden by many ancient councils, as Chalcedon, c. x. (451 A.D.), 2d Nicæa, c. xv. (787 A.D.). This prohibition, however, was not regarded as absolute and admitting no possible exception; the natural ground of the prohibition being the impossibility, in ordinary cases, of the same individual adequately discharging the duties of more than one office. It has been held, therefore, that in cases in which this impossibility does not really exist, the union of two or more offices in the hands of one person might, speaking absolutely, be permitted without infringing the divine law. Canonists therefore distinguish 'compatible' and 'incompatible' benefices or dignities. Two benefices may be incompatible in three ways—(1) if each requires residence (*ratione residentie*); (2) if the duties of both fall to be discharged at one and the same time (*ratione servitii*); or (3), if the revenue of either fully suffices for the becoming maintenance of the incumbent (*ratione sustentationis*). In other cases, benefices or dignities are considered compatible, and with the due dispensation, may be held by the same person. The rules by which dispensations from the law of residence are to be regulated, as well as the penalties for its violation, whether on the part of the patron or on that of the recipient, have formed the subject of frequent legislation, as in the 3d and the 4th councils of the Lateran, in the decretals of Innocent III. and many other popes, and especially in those of the Council of Trent. In general, it may be said that the canon law regards as incompatible (1) two benefices each having the cure of souls; (2) two 'dignities'; (3) a 'dignity' and a cure of souls; (4) a cure of souls and a simple benefice requiring residence. In other cases than these, the pope is held to have the power of dispensing. There is no department of discipline, however, in which the tendency to relaxation has been greater or more persistent; and one of the gravest of the abuses of the church was the prevalence of pluralism of 'incompatible' benefices, even of bishoprics; and although a constant effort was made to prevent this abuse, the evasions of the law were not only frequent, but even screened from punishment. In later times, the evil has in great measure disappeared in the Roman Catholic Church.

The English law, before the Reformation, in the main coincided with the canon law; and the legislation of Henry VIII. preserved the same general spirit, only substituting the dispensing power of the crown for that of the pope.

By 13 and 14 Vict. c. 98, it is provided that no incumbent of a benefice shall take and hold together with it another benefice, unless the churches are within three miles of one another by the nearest road, and the annual value of one of them does not exceed £100. Nor can two benefices be held together if the population of one exceeds 3000, and that of the other exceeds 500. The word benefice in this sense includes any perpetual curacy, endowed public chapel, parochial chapelry, or district chapelry.

But a dispensation or license can be obtained from the archbishop, so as to allow two benefices to be held together; and if the archbishop refuse his licence, the party may appeal to the Privy Council. A special provision is also contained whereby the head ruler of any college or hall in the universities of Oxford or Cambridge, or warden of Durham University, is prohibited from taking any cathedral preferment or any other benefice. If any spiritual person holding a benefice shall accept another benefice contrary to the statute, the first benefice shall *ipso facto* become void. At the same time, provision is made by statutes for uniting benefices where the aggregate population does not exceed 1500, and the aggregate yearly value does not exceed £500.—In Ireland, no faculty or dispensation can be granted to any spiritual person to hold two or more benefices.—In Scotland, it is contrary to an old Scotch statute for a minister of the Established Church to hold two or more charges; but the question has arisen almost exclusively with reference to clergymen appointed professors before or after an appointment to a country charge, in which case a resignation is necessary of one of the offices within a certain time after the appointment; but this disqualification does not apply to city charges.

PLUSH (Fr. *peluche*), a variety of woven cloth, having a long shaggy pile on the upper surface. Although woven like velvet, it differs from it in the greater length of the pile, and in its not being clipped or shorn to a uniform length. Formerly, it was made of a double warp, one thread being usually double worsted yarn, the other, intended to form the pile, of goat's hair, and the weft of worsted; occasionally, only worsted was used. Now, it is made very extensively of silk and cotton, the silk taking the place of the goat's hair to form the pile. This silk plush is the material now almost universally used for making gentlemen's hats, instead of beaver-hair, as formerly. It is also worked in coloured silks, for many articles of ladies' attire. See WEAVING.

PLUTARCH (*Ploutarchos*), the biographer and moralist, was born at Chæroneia in Boeotia. We can only approximate to the year of his birth. He tells us himself that he was a student of philosophy at Delphi, under Ammonius, when Nero was making his progress through Greece in 66 A.D.; and we may safely infer, therefore, that in that year he was beyond the age of puberty. He lived for some years in Rome, and in other towns of Italy, where he seems to have been much occupied with public business, and with giving lessons in philosophy—a circumstance to which he attributes his having failed to learn the Latin language in Italy, and his having to postpone his studies in Roman literature till late in life. During the reign of Domitian, he was delivering lectures on philosophy at Rome; but we have not sufficient evidence for the statement, that he was preceptor to Trajan, or that that emperor raised him to consular rank. The later years of his life he spent at Chæroneia, where he discharged the duties of archon and priest of Apollo. He lived down to 106, the eighth year of the reign of Trajan; but how much longer is not known. He was married to an amiable wife of the name of Timoxena, by whom he had several sons, who reached manhood, and left descendants.

The work by which P. is best known is his *Parallel Lives* of forty-six Greeks and Romans. These are arranged in pairs, each pair forming one book (*biblion*), consisting of the life of a Greek and a Roman, and followed by a comparison between the two men. In a few cases, the comparison is omitted or lost. The heroes of these biographies are the

following: 1. Theseus and Romulus; 2. Lycurgus and Numa; 3. Solon and Valerius Publicola; 4. Themistocles and Camillus; 5. Pericles and Q. Fabius Maximus; 6. Alcibiades and Coriolanus; 7. Timoleon and Æmilius Paulus; 8. Pelopidas and Marcellus; 9. Aristides and Cato the Elder; 10. Philopœmen and Flaminius; 11. Pyrrhus and Marius; 12. Lysander and Sulla; 13. Cimon and Lucullus; 14. Nicias and Crassus; 15. Eumenes and Sertorius; 16. Agesilaus and Pompeius; 17. Alexander and Cæsar; 18. Phocion and Cato the Younger; 19. Agis and Cleomenes, and Tiberius and Caius Gracchus; 20. Demosthenes and Cicero; 21. Demetrius Poliorcetes and M. Antonius; 22. Dion and M. Junius Brutus. In addition to these are placed in the editions after the 46th *Parallel Lives*, the biographies of Artaxerxes Mnemon, Aratus, Galba, and Otho. P. has no equal in ancient, and few in modern times, as a writer of 'Lives.' His power lies in his felicitous grasp of the character as a whole, and his skill in keeping minor details in subordination. It is not till the reader has seen the portrait in its completeness that his attention is attracted to accessory points. 'There are biographers (says an admirable writer in the *Quarterly Review*) who deal with the hero, and biographers who deal with the man. But Plutarch is the representative of ideal biography, for he delineates both in one.' Yet with all their artistic harmony, his lives abound with anecdotes and *bon-mots* in such profusion, that they form one of our chief authorities for the table-talk of the Greeks and Romans. Their popularity in ancient, medieval, and modern times, with readers of every rank and age, is something extraordinary, and they have in consequence exerted a very powerful and a very salutary influence on the art of biography, as subsequently practised. The other writings of P., more than 60 in number, are included under the general title of *Moralia*, or *Ethical Works*. Several of these are not purely ethical in their tenor; while many of them are probably not by him, or if they are, do him small credit. Even in the best of the *Moralia*, there is no philosophical system to be found; their merits are not speculative, but practical; and their value consists mainly in their good sense, in the justness of their views on the ordinary affairs of human life; and in the benevolence of tone diffused throughout them. The best text of the *Lives* is that of Immanuel Bekker; the best translation in English is that of Dryden and others, as re-edited by Clough. The best edition of the *Moralia* is by Wytenbach (Oxford, 1795—1800); and of the entire works, the editions of Reiske (Leip. 1774—1782) and Hutten (Tübingen, 1791—1805).

PLUTEUS, in Classical Architecture, a wall filling up the space between two columns. Also the space between two orders, placed over one another, as in the amphitheatres, &c.

PLUTO (Gr. *Ploutôn*, from *Plouteo*, to be rich), originally only a surname of HADES, as the giver or possessor of riches, is, in the Mythology of Greece, the third son of Kronos and Rhea, and the brother of Zeus and Poseidon. On the tripartite division of the universe, he obtained the sovereignty of the under-world—the realm of darkness and ghostly shades, where he sits enthroned as a 'subterranean Zeus'—to use the expression of Homer, and rules the spirits of the dead. His dwelling-place, however, is not far from the surface of the earth. P. is inexorable in disposition, not to be moved either by prayers or flatteries. He is borne on a car, drawn by four black steeds, whom he guides with golden reins. His helmet makes him invisible, whence, according to some scholars,

his name of *Hades* (from *a*, priv., and *ideîn*, to see); although others, with at least equal probability, derive *Hades* from *hado* or *chado*, to receive or embrace, and translate the word the 'all-receiver.' In Homer, *Hades* never means a place, but always a person. Moreover, it is to be noticed that the poet does not divide the realm of the shades into two separate regions. All the souls of the dead—good and bad alike—mingle together. Subsequently, however, when the ethical conception of future retribution became more widely developed, the kingdom of the dead was divided into Elysium (q. v.), the abode of the good, and Tartarus (q. v.), the place of the wicked. This change also exercised an important influence on the conception of Pluto. The ruler of the under-world not only acquired additional power and majesty, but the very idea of his character was essentially modified. He was now regarded as a beneficent deity, who held the keys of the earth in his hand, and possessed its metallic treasures (whence his new name *Pluto* or *Plutus*), and who blessed the year with fruits, for out of the darkness underground come all the riches and swelling fulness of the soil. Hence, in later times, mortals prayed to him before proceeding to dig for the wealth hidden in the bowels of the earth.

P. married Persephone (Proserpina), the daughter of Demeter (Ceres), after carrying her off from the plains of Enna. He assisted his brothers—according to the mythological story—in their war against the Titans, and received from the Cyclops, as a reward for delivering them from Tartarus, the helmet that makes him invisible, which he lent to Hermes (Mercury) in the aforesaid war, to Perseus in his combat with the Gorgons, and which ultimately came to Meriones. The Erinyes and Charon obey his behests. He sits in judgment on every open and secret act, and is assisted by three subordinate judges, Æacus, Minos, and Rhadamanthus. The worship of P. was widely spread both among the Greeks and Romans. Temples were erected to his honour at Athens, Elis, and Olympia. Among trees and flowers, the cypress, boxwood, narcissus, and maidenhair were sacred to him; bulls and goats were also sacrificed to him amid the shadows of night, and his priests had their brows garlanded with cypress wreaths. In works of art, he resembles his brothers Zeus and Poseidon; only his hair hangs down somewhat wildly and fiercely over his brow, and his appearance, though majestic, as becomes so mighty a god, has something gloomy and terrible about it. There can be little doubt that he, as well as Pan (q. v.), helped to trick out the conception of the devil prevalent during the middle ages, and not yet extinct. If it was from Pan that the devil derived those physical characteristics alluded to in the famous *Address to the Devil* by the poet Burns:

O thou, whatever title suit thee,
Auld Hornie, Satan, Nick, or Clootie,

it is no less certain that it is to P. he owes his position as 'king of Hell,' 'his Blackness,' and many of the insignia of his infernal royalty.

PLUTONIC ROCKS, the name given by Lyell to the Granitic Rocks, from the supposition that they were formed at considerable depth in the earth, and were cooled and crystallised slowly under great pressure. They were so designated in contradistinction to the Volcanic Rocks, which, though they have risen up from below, have cooled from a melted state more rapidly upon or near the surface. See GRANITE.

PLYMOUTH, an English seaport and market town, and a parliamentary and municipal borough

in the south-west of Devonshire, 246 miles west-south-west of London. It stands in the bight of Plymouth Sound (q. v.) between the estuaries of the Plym and Tamar. To the west of it is Stonehouse (q. v.), a township and coast-guard station, and still further west is Devonport (q. v.), the great naval and military station. The two former places, however, having become united by continuous lines of houses, have lost their individuality, and are (with Devonport, which is walled, fortified, and surrounded by a moat) now generally considered as one great town. Of this great centre of fashion, trade, and naval and military preparation, P. proper, which covers an area of one square mile, may be called the city, and Devonport the west-end; while Stonehouse is an intermediate district, containing chiefly factories, barracks, victualling yards, hospitals, and other institutions. P. proper extends from Mill Bay on the west to the mouth of the Plym on the east. Its site is somewhat rugged and uneven; an eminence forming the suburbs runs along its north side, and another eminence, partly occupied by the citadel, fronts the Sound. The chief buildings are the Royal Hotel, comprising an immense inn, assembly-rooms, a theatre, and the Athenæum, all partially destroyed by fire in 1862, and rebuilt in 1863; public library, containing in its Cottonian collection 300 sketches by the old Italian masters; St Andrew's Church, the tower of which dates from 1490; and Charles Church (1646—1658), dedicated, with fervent loyalty, at the Restoration, to 'St Charles the Martyr.' There are also several important educational establishments, some of which are endowed, as well as many charitable institutions. Mill Bay and Sutton Pool are two small inlets of the Sound, in which lie all the merchant-vessels bound for P. proper. Between these inlets, and running along the shore, is the eminence or high plateau of land, called the Hoe. From this ridge, whence the approach of the Spanish Armada is said to have been first descried, magnificent shore and sea views may be obtained. Its eastern end is occupied by the citadel, a fortress mounting 150 guns, which commands the entrance of the Cutwater (the lower estuary of the Plym), and of Sutton Pool. Mill Bay, on the west, is so deep that vessels of 3000 tons can lie at the pier at low-water. Here are the important Great Western Docks, covering an area of fourteen acres, and having a depth of 22 feet, constructed about the years 1855—1858. Close to these docks, and connected with them by a tram-line, are the termini of the South Devon, Tavistock, and Cornwall railways. In 1872, 5755 vessels, of 933,184 tons, entered and cleared the port. Commerce is carried on to a considerable extent with the Cape of Good Hope, the West Indies, and the Mediterranean; the coasting trade is also important, and the fisheries are productive. Pop. (1871) 70,091; (1881) 75,096.

P., described by Leland as being, in the reign of Henry II., 'a mene thing, an inhabitation of fishars,' was called by the Saxons Tameorworth (town on the Tamar); after the Conquest it was called Sutton (South Town); and it was not till the reign of Henry VI. that it received the name of Plymouth (mouth of the Plym). During the fourteenth and fifteenth centuries it was frequently attacked and set on fire by the French, and in 1512 an act was passed for the strengthening of its defences, which since then have greatly increased, until now the whole shores of the Sound are well defended by cannon, and a cordon of inland forts has been constructed at immense cost, surrounding the Three Towns at a distance of from two to three miles.

PLYMOUTH, a town in Massachusetts, U.S., on Plymouth Bay, 37 miles south-east of Boston, famous in the history of New England as the landing-place of the 'Pilgrim Fathers' from the *Mayflower*, December 11, 1620, O.S. Plymouth Rock is a granite boulder at the water's edge on which they landed. In Pilgrim Hall in a museum are preserved many relics of the first settlement of the country, among which are Governor Carver's chair and the sword of Miles Standish. The village has a good harbour and flourishing trade. Pop. in 1860. 6272; in 1870, 6238; in 1880, 7093.

PLYMOUTH BRETHREN, a religious sect which sprang into existence about 1830—1835 in Plymouth, Dublin, and other places in the British islands, and which has extended itself considerably throughout the British dominions and in some parts of the continent of Europe, particularly among the Protestants of France, Switzerland, and Italy, and also in the United States of America. It seems to have originated in a reaction against exclusive High Church principles, as maintained in the Church of England, with everything of a kindred nature in other churches, and against a dead formalism associated with 'unevangelical' doctrine. Many of the first members of the new religious communities formed in Plymouth and elsewhere were retired Anglo-Indian officers, men of unquestionable zeal and piety; and these communities began to appear almost simultaneously in a number of places. Their origin is, however, very much to be ascribed to the labours and influence of Mr Darby, from whom the P. B. on the continent of Europe are very generally known as *Darbyites*. Mr Darby was a barrister, moving in the highest circles of society; and under deeply religious impressions, became a clergyman of the Church of England, and lived for some time in a mud-hovel in the county Wicklow, devoting himself to his work; but afterwards left the Church of England from conscientious scruples, and became an evangelist unconnected with any church. In this character, he laboured both in England and on the continent of Europe, preaching in French, English, and German. He also gave utterance to his opinions in numerous pamphlets, and in a quarterly periodical called *The Christian Witness*, which for a number of years was the 'organ' of the Plymouth Brethren. He continues to visit from time to time the communities or meetings of Plymouth Brethren. His tenets, and those of the P. B. in general, are strictly Calvinistic: original sin and predestination, the efficacy of Christ's sacrifice, the merit of his obedience, the power of his intercession, the gracious operations of the Holy Spirit in regeneration and sanctification, are prominent points. Millenarian views are also generally entertained by the P. B.; and they usually practise the baptism of adults without regard to previous infant baptism. They acknowledge the sacrament of the Lord's Supper, and administer it to one another in their meetings, usually on every Sunday, or 'first day of the week'; in this, as in everything else, refusing to acknowledge any special ministers. They utterly reject confirmation. Their most distinctive peculiarity, when contrasted with other Calvinistic churches, is their complete rejection of ecclesiastical organisation. They suppose the whole Christian body in the world to have declined from truth and duty, like Israel of old, and therefore to have been 'corporately rejected of God,' and believe the true church to consist of themselves and of other chosen ones in the various Christian churches. They refuse to recognise any form of church government, or any office of the ministry; they insist much on the equal right of every male member of the church to

'prophecy' or preach; and in their meetings, after each hymn or prayer, there is usually a pause, that any one, moved by the Spirit, may undertake this office. They exclude persons known to have been guilty of gross sins from participation with them in the Lord's Supper, until proof is afforded of repentance. The P. B. reject every distinctive appellation but that of Christians; although a special denomination is found necessary to designate them; and, in fact, no one not holding their views could remain associated with them. A great schism took place among them in consequence of doctrines preached at Plymouth and Bristol concerning the human nature of Christ; Mr Darby vigorously opposing what he deemed a dangerous error, and he and his adherents utterly separating from the fellowship of those who maintained or even refused to condemn it. One of the most noted (if not notable) converts to the principles of the sect was the revivalist Guinness, who was baptised in 1860 by another Plymouth brother, Lord Congleton.

On the continent of Europe, the P. B. have in many places given great trouble to the Protestant churches, by their opposition to all ecclesiastical order or organisation. See Mrs H. Grattan Guinness's *Answer to the Question: Who are the Plymouth Brethren?* (Philadelphia, 1861).

PLYMOUTH SOUND, a well-known roadstead on the south-west of Devonshire, important as a naval station, has considerable claims to the distinction of being called, as it frequently has been, the most beautiful estuary on the English coast. Its position at the entrance of the English Channel is much in its favour. It is two and a half miles wide, and extends inland for three miles. It penetrates into the country by means of the harbours of Hamoaze and Catwater, the estuaries of the Tamar and Plym respectively. On its west side is Cawsand Bay. The shores, which present many beautiful views, rise in hills of from 100 to 400 feet, and are dotted over with woods and with villages, and bound by coasts which are generally rocky and abrupt. Mount Edgecombe Park, the beautiful seat of the Earl of Mount Edgecombe, occupies the west shore of the sound. At the mouth of the Tamar is the small island of St Nicholas, or Drake's Island, a pyramidal rock strongly fortified. The Sound is open to the south-west, from which direction strong winds frequently blow, and violent surges are thrown in from the Atlantic. In order to protect the shipping in the harbour, a massive stone breakwater, 1700 yards in length, was constructed at a cost of about £1,500,000, and completed in 1841. See **BREAKWATER**. On a sunken rock just inside the breakwater and at its centre, a strong stone fort has been erected; and an extensive series of stone batteries have been erected at Bovisand and Picklecombe on the mainland, on either side of the entrance to the harbour. Fourteen miles south-south-west of Plymouth is Eddystone Light-house. See **EDDYSTONE**.

PNEUMATIC DISPATCH. This name is given to a mode of sending parcels and mail-bags through a tube by atmospheric pressure, or by a partial vacuum. Early in the present century, Mr Medhurst conceived the idea of some such contrivance. He published two pamphlets, one under the name of *A New Method of Conveying Letters and Goods by Air*; and the other, *A New System of Inland Conveyance for Goods and Passengers*. He proposed to construct air-tight tunnels, with carriages moving through them on rails; and these carriages were to be propelled by compressed air from behind, or else by suction, in virtue of a vacuum formed in front of

them. He also planned, as an alternative, how there might be a parcels' carriage within the tunnel or tube, and a passenger carriage running along the top of the tube: the two being connected by an upright bar passing through a valved slit in the tube. Medhurst was laughed at by his contemporaries as a visionary; but his speculations were called to mind in later years, and led to the attempts noticed under **ATMOSPHERIC RAILWAY**.

In 1861, was announced a *Pneumatic Dispatch* project, based on a reconsideration of the causes of failure in the earlier schemes. The conveyance of passengers and of bulky goods was not here contemplated; parcels and mail-bags were the articles held chiefly in view. To test the theory, a quarter of a mile of iron tube was experimentally laid down near Battersea, with a fair average of gradients and curves purposely given to it. The tube was about 30 inches in diameter, and it was found easy to propel a train through the tube, consisting of two iron carriages of 7 cwt. each, at the rate of 30 miles an hour.

After many financial discouragements, a *Pneumatic Dispatch Company* obtained capital in 1862, and began operations in 1863. The experimental tube was removed to London, and laid down beneath the roadway of Seymour Street, Euston Square, from the Euston station of the London and North-western Railway to the N. W. district post-office in Eversholt Street—a distance of one-third of a mile. Mail-bags being successfully transmitted in this way, the company commenced in 1864 the construction of a tube on a larger scale, and this has since been completed. The tube is laid down from Euston Square to St Martin's-le-Grand, by way of Tottenham Court Road, Holborn, and Newgate Street—a distance of 2½ miles. The tube is of large size, nearly 4½ feet in diameter, laid down at as small a depth beneath the carriage-way of the several streets as the water and gas pipes will permit. It is chiefly of cast-iron, but some portions on a sharp curve are of brick; there is a large engine-house on the south side of Holborn, near Lincoln's Inn Fields, to supply all the power for working the whole tube in both directions. Rarefied air in one half of the tube will draw a train of iron carriages, laden with parcels and mail-bags, from Euston Station to Holborn; and compressed air will drive them through the other length of tube from Holborn to the General Post-office—there being suction in the one case, and pressure in the other. A reverse action will bring trains in the other direction. The necessary amount of rarefaction in the one case and of compression in the other will be determined by experiment; but both will be produced by means of a revolving fan of peculiar construction and large dimensions, worked by a powerful steam-engine at the Holborn Station. The sectional area of the tube being very much greater than that of the experimental tube tried in Seymour Street, carriages of much greater length, width, height, and strength can be accommodated, and more of them in one train—provided the steam-power be sufficient. If the plan succeeds, other tubes will be laid down from Holborn to Charing Cross, and in other directions, to connect the General Post-office with the district offices, and with the chief railway termini. With regard to parcels, provisional agreements have been made with Messrs Pickford and other carriers for extending the tube to certain great dépôts in the city, and for carrying railway parcels to and fro between those dépôts and the railway termini. If the anticipations are borne out, there will be great saving of time in the delivery of letters and parcels, and a material lessening of the number of parcels and mail-vans and carts in the over-crowded streets of the metropolis. The work will be silently going

on underground, instead of visibly and noisily occupying the roadways.

The problem of *passenger* conveyance within a pneumatic tube was shewn to be practicable by Mr Ram-mell, in an experiment tried at the Crystal Palace in 1864; but nothing further has been done in the matter. More success has attended the introduction of a system for transmitting small rolls of paper through tubes of a few inches diameter by pneumatic pressure. Mr Siemens introduced it at Berlin; it was next tried with success at Paris; Mr Latimer Clark constructed similar apparatus in London, and the plan is in regular use by the postal authorities in the telegraph department of the new buildings connected with the General Post-office in St Martin's-le-Grand. Small tubes two or three inches in diameter are arranged for the reception of telegram forms or papers made up into a roll and put into a felt cylinder. The purpose is to economise time and expense in conducting the government postal telegraph business by *blowing* along the telegram forms at the rate of 30 miles an hour instead of sending them by street conveyance. Two parallel tubes have been laid down beneath the pavements of the streets from the General Post-office to Temple Bar, to Charing Cross, to the Stock Exchange, and to other parts of London. One tube in each pair may be called the down line, the other the up; the two are placed in connection at each end, and one steam-engine works them both. The felt cylinder very nearly fills up the tube, but still moves easily along it; this movement is brought about either by the formation of a partial vacuum in front of the cylinder, or by compressing the air behind it; and the steam-power is so applied as to produce either or both of these results, according as convenience may suggest. An ingenious plan is adopted for accommodating one or more intermediate offices, just as local stations are accommodated between the two termini of a railway. The cylinder or *carrier* travels from end to end of the tube, unless a block or check action is purposely put in force at an intermediate station; and the mode of effecting this is one of the most beautiful of Mr Siemens' inventions relating to the subject. Two pieces of pipe, the *receiver* and the *transmitter*, are made exactly alike, and are so pivoted together that either may be adjusted into a cavity cut in the tube, and made temporarily to form part of it. The carrier, we will suppose, is intended to stop at the intermediate stations to admit of the removal of some telegram papers and the introduction of others. A click is heard, the carrier strikes against an obstruction in the receiver; the cavity is opened; the exchange of papers is made; the carrier is re-introduced, but into the transmitter instead of the receiver; the cavity is closed again; and the carrier resumes its journey. All this is the work of a few seconds merely. If the intermediate station has nothing to send and nothing to receive, the transmitter alone is used, and the carrier travels on without stopping. The up-tube and the down-tube have each its apparatus of receiver and transmitter. The felt cylinder and its contents being very light, a slight rarefaction of the air in front of it, or condensation of the air behind it, is sufficient to produce a speed equal to 20 or 30 miles an hour. Practically, there is a current of air maintained circulating through the two tubes and their terminal connections; wherever a carrier is placed in this current, it is blown along; and there may be two or more carriers travelling at the same time.

PNEUMATIC TROUGH, is a piece of chemical apparatus originally devised by Priestley, and now in daily requisition in every laboratory. By its means, gases can be collected in vessels for experiments or examination, and can be decanted from one jar to another with as much ease as if we were dealing with liquids. The pneumatic trough consists of a vessel of water, provided with a ledge

or shelf at the depth of two or three inches from the top. The jars in which the gas is to be collected are filled with water, and placed with their mouths downward upon the shelf, which is kept a little under water, so as to prevent the entrance of air into the jars. When the edge of the jar is brought over the extremity of the tube carrying the gas, the bubbles of gas rise through the water, collect in the upper part of the jar, and displace the liquid. As soon as a jar is filled, it may be removed by sliding under its open mouth, while still under water, a plate or tray containing enough of water to cover the edge of the jar; and oxygen and many other gases may be thus preserved for hours. Another jar full of water is substituted for the removed jar. The trough is best constructed of japanned copper, and may be made of any size corresponding to that of the jars; and in the shelf a groove should be made about half an inch in width, and the same in depth, to admit the extremity of the gas-delivering tube beneath the jar.

PNEUMATICS (Gr. *pneuma*, spirit or breath, air) is the science which treats of the mechanical properties of æriform fluids, such as their weight, pressure, elasticity, motion, &c. The great representative of the æriform fluids is the atmosphere. The atmosphere is very frequently called 'air,' to distinguish it from the others, which are known as 'gases.' The fact of air having weight, and generally exercising pressure and resistance, was unsuspected by most of the ancients, though they were aware of the latter property in particular cases, from seeing and feeling the effects of the wind; but the idea that air in a state of rest exerts pressure on a body immersed in it, never seems to have occurred to them. Aristotle, however, asserted that air had weight, and so did several subsequent philosophers; but the truth of this opinion was not established till the time of Torricelli (q. v.), who not only shewed that it had weight and exerted pressure, but also found the amount of this weight or pressure. See ATMOSPHERE. Pascal (q. v.) completed the investigation, and invented the Barometer (q. v.). The experiments of these philosophers proved that what is called 'suction' is nothing more than an effect of the pressure of the air on one side of a body, unbalanced by an equal pressure of air on the opposite side of it. To this property of air we owe the working of the various kinds of Pumps (q. v.), the Barometer (q. v.), the siphon, cupping-glass, &c. But the great distinguishing feature of æriform bodies is the repulsive force which their molecules exercise over each other, and the consequent expansion of these bodies when pressure is removed, or compression when pressure is increased. The investigation of the expansibility and compressibility of air was carried on by means of the Air-pump (q. v.), an invention of Guericke (q. v.), and soon resulted in the discovery of a law by Boyle (about 1650), and Mariotte (1676), called *Mariotte's Law* (q. v.), which affirms, that 'at a given temperature the volume of a gas is inversely as the pressure.' See GASES. The second great law of tension and pressure is that of Dalton and Gay-Lussac: (1801), which states, that 'when the tension remains the same, the density of a gas varies inversely as the temperature'—that is to say, when the temperature is increased by equal increments, the bulk is increased by equal increments. The motion of gases is subject to the same laws with that of liquids, the laws which regulate the motion of liquids depending for their efficacy not on the liquidity, but on the fluidity (see FLUID) of these bodies. The flow of gases in tubes seems to be retarded by friction against the sides, in the same way as that of water

is, and the diminished efflux at an orifice shews that the *vena contracta* exists for gases as well as for liquids. Abundance of examples and further explanations of the properties of air will be found under such heads as ATMOSPHERE, BALLOON, BAROMETER, DIVING-BELL, MAGDEBURG HEMISPHERES, &c.

PNEUMOGASTRIC NERVE, or *Par Vagus*, derives the first of its names from its supplying the lungs and stomach with nervous filaments, and the second from the wandering course which it pursues. It emerges from the medulla oblongata by eight or ten filaments, which unite and form a flat cord, that escapes from the cavity of the cranium (in association with the glossopharyngeal and spinal accessory nerve) by the jugular foramen. In this foramen, it forms a well-marked ganglionic swelling, while another is observed immediately after its exit from the skull. The nerve runs straight down the neck between and in the same sheath as the internal jugular vein and the carotid artery. Below the root of the neck, its course is different on the two sides; the right nerve running along the back of the œsophagus, is distributed to the posterior surface of the stomach, and finally merges into the solar plexus; while the left nerve runs along the front of the œsophagus to the stomach, sending branches chiefly over its anterior surface.

From anatomical considerations, based on the distribution of this nerve, and from the results of experiments on animals, it may be concluded that this is a mixed nerve, containing filaments both of sensation and motion. The pulmonary branches exercise a most important influence upon the respiratory acts, for when the pneumogastrics on both sides have been divided above the giving off of the pulmonary branches, the most severe dyspnoea comes on, the number of respirations is much diminished, and the animal breathes as if it were asthmatic; after a short time, the lungs become congested and dropsical, and the bronchial tubes filled with a frothy serous fluid; and if the cut ends of the nerves are kept apart, the animal never survives above three days. The gastric branches influence the movements of the stomach, while their destruction does not materially affect the secretion of the gastric juice or the process of chylification. Loss of voice and difficulty of breathing have been frequently traced to the pressure of an aneurism or other tumour on the recurrent or inferior laryngeal. Hooping-cough is ascribed by many high authorities to an affection of the pneumogastric nerve; and the violent spasmodic cough which accompanies enlarged bronchial glands, is probably due to the irritation of its pulmonary branches. The sympathy which exists between the digestive and the respiratory and circulating organs, is explained by the anatomical relations of this nerve. For example, both asthma and palpitation of the heart are often to be traced to some deranged state of digestion. Vomiting may be excited by irritation of the central or the distal extremities of the nerve. In disease of the brain, the vomiting, which is often an early symptom, is caused by irritation of the central extremity; and in sea-sickness, it is that extremity also which is irritated by the disturbed state of the circulation in the cranium; while by introducing emetic substances into the stomach, the vomiting is produced by the irritation of the peripheral (or distal) filaments.

PNEUMONIA, or Inflammation of the Substance of the Lungs, is a disease which is divided by pathologists into three distinct stages, corresponding to different degrees or periods of inflammatory action. The first stage is that of *engorgement*, in which the lung or a portion of it is gorged

with blood, is of a darker colour externally, and crepitates (or crackles) less under pressure than healthy lung does; the air that ought to exist in the pulmonary cells being in a great measure replaced by fluid. On cutting the engorged portion, the section is seen to be redder than natural, and to yield a great quantity of reddish and frothy serum. The most engorged portions will generally float in water, although they are heavier than healthy lung. If the inflammation continues, new characters appear. The affected portion of the lung ceases to crepitate under pressure, and sinks when placed in water, in consequence of its now containing no air. The spongy character of the lung is gone. It is now solid, and the cut surface so closely resembles that of liver, that the term *hepatisation*, first suggested by Laennec, is generally applied to this stage. On examining with the microscope a torn fragment of the hepatised lung, it will be seen to be composed of small red granulations pressing upon one another, which are doubtless the air-cells clogged up, thickened, and made red by the inflammation. In the third and most advanced stage, the pulmonary tissue remains, as in the last stage, dense, solid, and impervious to air; but its section, in place of being red, is now of a reddish-yellow, or straw, or drab, or stone colour, or is of a grayish tint; and the little granulations which were red in the second stage, are now whitish or gray, from the presence of pus or matter, which permeates through the pulmonary tissue, rendering it very soft and friable. To this stage, which is in reality one of *diffused suppuration*, Laennec applied the terms *gray hepatisation*, or *purulent infiltration*. Besides revealing to us the above information regarding the changes which the pulmonary textures undergo in the three stages of this disease, morbid anatomy teaches us that inflammation does not attack all parts of the lung on both sides indiscriminately. It is much more common on the right side of the body than the left. Of 210 cases collected by Andral, 121 were on the right lung alone, and 58 on the left side alone; while in 25 it was double (i. e., occurred in both lungs), and in six the seat was uncertain; so that pneumonia is more than twice as common on the right side as on the left, and only occurs on both sides together as often as once in eight times. According to Grisolle, however, whose *Traité Pratique de la Pneumonie* is the standard work on this disease, the relative frequency with which the right lung is affected is rather less than two to one (11 : 6). Moreover, pneumonia is considerably more common in the lower than in the upper lobes of the lung—a point of great importance in diagnosis. Of 88 cases observed by Andral, the inflammation was found to affect the lower lobe 47 times; the upper lobe, 30; and the whole lung at once, 11. Inflammation of the bronchial tubes so constantly accompanies inflammation of the tissues of the lung, that although bronchitis often exists without pneumonia, pneumonia never occurs without bronchitis. Moreover, a certain amount of pleurisy or inflammation of the investing membrane, accompanies pneumonia in a very large majority of cases.

The alterations which take place in the tissue of the lung give rise to important modifications of the ordinary sounds yielded by auscultation and percussion; the discrimination of which, however, belong to the physician.

The following are the general symptoms, as distinguished from the physical signs, of pneumonia. The disease generally commences with inflammatory fever; and pain in the side, due to pleurisy in most cases, soon supervenes. The breathing is always more or less affected, especially when the

upper lobe is inflamed. According to Professor Gairdner, the dyspnoea of *pure pneumonia* is a mere acceleration of the respiration, without any of the heaving or straining respiration observed in bronchitis, or in cases where the two diseases are combined. Delirium is a very frequent, and always a dangerous symptom, indicating that the due arterialisatation of the blood is much interfered with, and that the impure circulating fluid is affecting the brain. The cough is usually dry at first, but in a few hours it is accompanied by the expectoration of sputa of so characteristic a nature as to afford almost certain evidence of the presence of the disease. On the second or third day, the expectoration, which previously consisted merely of a little bronchial mucus, consists of transparent and tawny, or rust-coloured sputa, which unite in the vessel containing them into one gelatinous mass. The colour is owing to the complete blending of the blood and mucus, and in proportion to the quantity of the former, the sputa is more or less deeply tinged. So long as the expectorated matter flows readily along the side of the vessel when it is tilted, there is reason to believe, unless physical signs tell us otherwise, that the inflammation is still in the first stage; but when the sputa are so viscid that the vessel may be inverted and strongly shaken without their being detached, there is reason to fear that the pneumonia has reached the second stage. If improvement now commences, the sputa become less tenacious, less rust-coloured, and gradually like the expectoration of common catarrh. But if the disease advances, the rust-coloured sputa, although in less quantity, may go on to the end; or there may be no expectoration, either on account of its own tenacity, or of the patient's want of power to eject it, in which case the air-passages get gradually filled, and death from suffocation occurs; or there may be the expectoration of a fluid of the consistence of gum-water, and of a brownish-red colour (resembling prune-juice), which, according to Andral, affords strong evidence that the disease is in its third stage; or, lastly, pure pus may be excreted during the third stage.

In its first and second stages, this disease is tolerably amenable to treatment. Whether, when the lung has reached the third stage, it is still susceptible of repair, we cannot tell, because we have no certain sign of the commencement or establishment of this third stage during life, although we may guess that it is established, if the face has become very pale and corpse-like; if there is the prune-juice or purulent expectoration; and if the disease has lasted for a sufficient time to have advanced so far, although it would be very difficult to state, with any approach to accuracy, what the necessary time is. The average duration of pneumonia may be placed at ten days or a fortnight.

Of the causes of this disease, very little need be said. Sometimes no cause can be traced. Very often it is the consequence of exposure to cold, especially when the body was previously heated by exercise; but why such exposure should in one person cause pneumonia, in a second, pleurisy, in a third, pericarditis, and in a fourth, peritonitis, we cannot tell.

The following is a brief outline of the treatment to be adopted, provided the patient was previously strong and healthy. In the first stage, free venesection, tartarised antimony (one-third of a grain to half a wine-glassful of water every hour, and the dose to be increased to a grain or more hourly, if there is no purging or vomiting, which may often be prevented by the addition of a few drops of laudanum to each dose), and antiphlogistic regimen, generally are of service. Under this system there

are often signs of improvement in five or six hours, although sometimes there is no change for the better till twenty-four hours or more have elapsed. When the disease has reached the second stage, in preference to continuing the antimony, we should as speedily as possible get the system gently under the influence of mercury, in the mode recommended in the articles PERICARDITIS and PERITONITIS. If there is great depression of the vital powers, as indicated by a feeble and irregular pulse, and the other ordinary signs of sinking, it will be requisite to administer stimulants, such as wine and carbonate of ammonia, and to feed the patient on beef-tea.

There are few diseases in which it is of greater importance to watch the patient during convalescence than in pneumonia. The convalescence is often rather apparent than real, and as Dr Watson truly observes: 'A patient can never be pronounced perfectly secure so long as any trace of crepitation remains in the affected lung, and this may often continue long; nay, it not unfrequently ceases only on the supervention of another more surely fatal though less rapid disorder—viz., tubercular consumption.'

PO (anc. *Eridanus* and *Padus*), the largest river of Italy, rises in two springs on the north and south sides of Monte Viso, one of the Cottian Alps, close to the French frontier, and in lat. about 44° 40' N. It flows eastward for upwards of 20 miles, when, arriving before Saluzzo, it emerges from its rocky defiles, and enters upon the plain. From Saluzzo, it flows north-north-east past Turin; and arriving at the town of Chivasso, it changes its course toward the east, in which direction it flows to its embouchure in the Adriatic. Upwards of 50 miles above its mouth, it begins to form its delta, the principal branches being the *Po della Maestra*, on the north, and the *Po di Primaro*, on the south. The unhealthy marsh of the *Val di Comacchio* extends immediately north of the Primaro branch. The Po receives from the left, the Dora Ripaira, Dora Baltea, Sesia, Ticino, Adda, Oglio, and Mincio; from the right, the Tanaro, Bormida, Trebbia, Taro, Parma, Enza, Secchia, and Panaro. At Turin, the Po is about 700 feet broad; at Pavia, 1000 feet; at Cremona, 1000 feet; and below Polesella, after throwing off the Po di Primaro branch to the south, its breadth is about 800 feet. It has an entire length of 450 miles, is navigable for small barges 60 miles from its source, and drains an area of nearly 40,000 square miles.

POA. See MEADOW GRASS.

POACHING, though not strictly a legal term, has so long been appropriated in popular parlance to describe a well-known legal offence, that it is now usually adopted in legal works. It means the unlawfully trespassing on another's lands for the purpose of catching or pursuing game; and it is likewise extended to the cognate offence of unlawfully catching or pursuing fish in another's waters.

1. *As to poaching game*.—The general law as to who is entitled to game, and in what circumstances, is stated under the head GAME. As a general rule, whoever is the proprietor of land, is the only person exclusively entitled to catch and kill the game; and where the land is let to a tenant, then, in England and Ireland, if nothing is said or agreed on the subject, it is the tenant, and not the landlord, who is entitled exclusively to the game. In Scotland, the rule is the reverse, for the landlord, and not the tenant, is there entitled to the game; but generally there is an express stipulation in leases, providing for this somewhat important right; and of course the parties may agree to anything they like on that head. Whoever, therefore, is entitled

to the exclusive privilege of killing the game, can alone give permission to a stranger to go and kill game there; and if this permission is not obtained, such stranger, whether qualified or not—i. e., whether he pays the government tax or not—is a poacher, if he go and kill the game. In England, there is a Day-poaching Act and a Night-poaching Act, imposing penalties on poachers. By the Day-poaching Act (1 and 2 Will. IV. c. 32, s. 30), whoever unlawfully goes upon lands not his own to pursue or kill not only Game (q. v.), but also rabbits, woodcocks, snipes, quails, and landrails, is liable to a penalty of £2. It has been held that this offence is committed whenever a stranger has *de facto* gone upon the lands to shoot without having previously expressly obtained the permission of the party entitled to the game, even though he may have had good reason to believe that such permission, if asked, would have been granted as a matter of course, and though, after hearing of the trespass, the owner quite approved and ratified it. Moreover, any person whatever, whether interested in the lands or not, may institute the proceedings for the punishment of the poacher; and the informer is entitled to half the penalty, the other half going to the poor of the parish. When a poacher is found trespassing on lands in search of game, the person entitled to the game there, or the tenant, or a gamekeeper, or servant of either, may demand the poacher's name and place of abode, and if it is refused, may arrest such poacher, and take him before a justice of the peace; but the poacher must be taken within twelve hours before the justice, otherwise he is entitled to go at large. It is only the persons named (and not any one of the public, or even a constable) who can arrest the poacher, and it can only be done when he is caught in the act on the very lands; for if the poacher clear the fence, and go on to other lands, he cannot then be arrested at all. If game is found on the poachers at the time they are caught, and it appear to have been newly caught, the party who is entitled to arrest him is entitled to seize the game also. If the poacher when convicted do not pay the penalty within the time fixed by the justices, he may be committed to the house of correction for a period not exceeding two calendar months. The party may appeal against his conviction to the Court of Quarter Sessions; but he must either remain in custody in the interval, or give security for the costs. The offence of poaching is punished more severely when five or more go out together, shewing thereby an attempt to intimidate gamekeepers and others, and in such case, each is liable to a penalty of £5. Moreover, if any of these five or more persons, acting in concert, be armed with a gun, and use violence, each is liable to an additional penalty of £5. As to the Night-poaching Act (9 Geo. IV. c. 69), it is provided, that any person by night—i. e., between the first hour after sunset and the first hour before sunrise—unlawfully trespassing in search of game, shall for a first offence be committed by the justices to the house of correction for three months, or in some cases for six months; for a second offence, shall be committed for six months, or in some cases for twelve months; and for a third offence, shall be guilty of a misdemeanour, and be imprisoned for two years. In case such night-poachers are found on the lands and in the act, the owner or occupier of the land or his servants may arrest the poachers, and take them before justices. If the night-poacher, when arrested, use firearms, sticks, or offensive weapons, he shall be guilty of a misdemeanour, and be punishable by two years' imprisonment in addition. In case of three or more night-poachers being armed with guns, bludgeons, or other offensive weapons, each is guilty of a

misdemeanour, and is liable to imprisonment for three years. Poachers have no right to kill game on the highway any more than in fields or enclosures, for the owners of the adjoining land are entitled to the game on the highway. Under the former law, it was, as already mentioned, incompetent for any person except the owner or occupier of the lands to apprehend the poacher, and even this could only be done when the poacher was caught in the act on the lands themselves; and hence, even constables had no power to seize the poacher, though seen to be coming from such lands. But by the recent Poaching Prevention Act (25 and 26 Vict. c. 114), which applies to the United Kingdom, if a constable now meet a suspected poacher on the highway, whom he has reason to suspect of coming from land where he has been poaching, such constable may stop and search the poacher; and if game, or implements for taking game, are found on him, may seize and detain them, and summon him before the justices. When before the justices, if it be proved by circumstantial evidence or otherwise that such game was procured by poaching, or that the implements were used, the poacher may be fined in a penalty of £5, besides forfeiture of the game, and guns, nets, and other implements which he may have so used. The person convicted may appeal, if he chooses, to the next Quarter Sessions, or, in certain cases, to the Court of Queen's Bench. With regard to the poacher's property in the game he kills, it is only in those cases where he is caught in the act, and on the spot, that the game can be taken from him; and this, for obvious reasons, seldom happens. In all other cases, the general rule applies, that whoever first catches (whether legally or illegally) a wild animal, is entitled to the property in it; and as game is in the category of wild animals, the poacher, though, it may be, committing several offences in catching the game, is yet generally entitled to keep it against all comers. The law of Scotland does not materially differ from that of England as to poachers; and the Night-poaching Act applies to it equally as to England. The Scotch Day Trespass Act (2 and 3 Will. IV. c. 68) closely agrees with the English act. But it is singular, that, in the case of night-poachers, the game cannot be taken from the poacher, even when caught in the act and on the lands; though it can be so in England.—*Paterson's Game-laws of the United Kingdom*, p. 172. The act conferring power on constables to stop and search poachers on the highway, also extends to Scotland. In England, the poaching of hares or rabbits by night in preserves is a misdemeanour; whereas it is only an offence punishable summarily in Scotland. In Ireland, the law as to poaching is not identical with the law of England, there being distinct statutes; but substantially the law is the same.—*Paterson's Game-laws*, 182. The law of the United Kingdom has often been described as too severe against poachers, inasmuch as most of the penalties are cumulative, and the justices who administer the laws are generally game-preservers, and so inclined to convict on the smallest scintilla of evidence. But, on the other hand, it is answered, that poaching is in reality only stealing under a milder name, and that the classes who poach are divided by a thin partition from thieves, game being, in every point of view, as much the fruit of the soil as apples or turnips, and the transition from habitual poaching to stealing being not only easy, but inevitable.—See *Paterson's Game-laws*.

2. *Poaching fish* is the unlawfully entering on another's fishery in order to catch fish. The law of fisheries is not uniform in the United Kingdom. In England, the general rule is, that any one of the

public may fish freely in the sea and in all navigable rivers; and where he can fish, he can catch salmon as well as every other kind of fish. But there is an exception to this generality, which consists in this, that as the crown could before Magna Charta (which took away such right) legally grant a several or exclusive fishery in the sea or a navigable river to an individual, and as this was, in point of fact, often granted, it follows that it is not uncommon to find, even at the present day, an individual, generally the lord of an adjacent manor, still claiming a several fishery in these places. If he can prove that he has exercised this exclusive right as far back as one or two centuries, it will be inferred that his right dates from before Magna Charta, and therefore will be legal. When such is the case, the public have no right to fish even in a navigable river or the sea at the specified places, the sole fishery being vested in this individual owner. In streams not navigable, the rule is, that each riparian owner—i. e., the owner of the lands on the bank of the stream—has a right to a several or exclusive fishery up to the middle line of the stream. If he is owner on both sides of the stream, then he has the exclusive fishery in the whole of the stream, so far as his lands extend. As to ponds, whoever is owner of the soil, is the owner of a several fishery there, unless he has let it to another. As to lakes, it is not clearly ascertained how the fishery is to be divided between the owners of the lands abutting thereon; but much will depend on the title to the lands and the subsequent user. As a general rule, there is no such thing as a right in the public to fish anywhere except in a navigable river or the sea, and that is subject to the exception of an individual claiming a several fishery, as before mentioned. It is often supposed that, at all events, if a highway adjoins a private stream, any one may fish in the stream or angle there; but this is a delusion. Nobody is entitled to use a highway for the collateral purpose of either fishing or poaching, the use of the highway, so far as the public are concerned, being confined to the purposes of travelling or transport. The general rule as to all several, i. e., exclusive, fisheries is, that whoever goes and poaches the fish commits an offence, for which he may be summoned before justices, and fined £5, over and above the value of the fish taken; and if the fishery where he poaches is adjoining the dwelling-house of the owner of the fishery, it is a still higher offence, for it is then an indictable misdemeanour. It is immaterial what kind of fish is caught by poachers, whether salmon or trout, or minnows; and it is immaterial how the fish are caught. But a milder punishment is awarded to the poaching angler, for even though he poach in a fishery adjoining the owner's dwelling-house, he incurs only a penalty of £5; and where the fishery does not adjoin a dwelling-house, he incurs a penalty of only £2. Whenever a fish-poacher is caught in the act of poaching, he may be at once apprehended, not only by the owner of the fishery, but by anybody; but this can only be done while he is on the spot or near it, for if he escape to the highway or to other lands before being arrested, he cannot then be apprehended, but can only be summoned before justices in the usual way. In this respect, a privilege is given to anglers, for in no case can these be arrested, if angling during the daytime; they can only be summoned for the offence. The poacher, when arrested, must be taken within a reasonable time before a justice of the peace, and charged with the offence. Though anybody may arrest the fish-poacher, still it does not follow that the fish poached can be taken from the poacher; on the contrary, the rule is the same as with reference to game, that

whoever first catches the fish, whether legally or illegally, is entitled to keep it; and though game can on certain occasions be taken from the poacher, this is by reason of an express provision in the Game Act; but there is no similar provision as to poached fish, so that the poacher, whatever other punishment he may incur, does not lose his fish. With regard, however, to the poaching implements, such as nets, it is provided by an express section of the Larceny Act (24 and 25 Vict. c. 96, s. 25), that the owner of the fishery or land where the poacher is caught, or his servant, may demand, and if refused, may seize the net, rod, line, hook, or other implement used for taking the fish, but no other person can seize these. It may also be observed that the English Salmon Fishery Act (24 and 25 Vict. c. 109), though singling out salmon from all other fish for peculiar protection, does not deal specially with poachers. Its chief object is to restrain the owners of salmon-fisheries themselves from fishing at certain times and by certain means, for which purpose, a close season is declared, during which no person, whether otherwise entitled or not, can legally catch salmon. Of course, poachers are prohibited from catching salmon at the times and by the means forbidden to the owner, and in this sense come within the Salmon Act. Thus, all persons are prohibited from poisoning salmon-rivers, from fishing salmon with lights, spears, gaffs, stroke-halls, or snatches; from using fish-roe as a bait; from selling or buying salmon roe; from using nets having meshes larger than two inches; from using fixed engines, dams and weirs, destroying young of salmon, &c., &c.

The law of Scotland, as to poachers of fish, differs considerably from that of England. In Scotland, the fundamental rule is, that salmon stands on a different footing from all other fish, and *primâ facie* belongs to the crown; so that no person in Scotland is entitled to fish salmon (except by angling) unless he can produce a grant or charter from the crown, conferring upon him such right. But, in point of fact, nearly all the great landed proprietors are in possession of such rights as pertinent to their lands. And the theory of the crown's original right to the salmon applies not merely to rivers, but to the sea-coasts all round Scotland. Hence the public have no right to fish with nets even in the sea, except by leave of the crown, or of the grantee of the crown, at the spot in question. Where a salmon-river belongs to several proprietors, the rule is, that none can fish by using fixed engines; but the only legal mode is the mode of fishing by net and coble (or boat). As regards poachers of salmon, the law is contained in the act 7 and 8 Vict. c. 95. By that law, whoever poaches salmon in a river, lake, or within a mile of the sea-shore, incurs a penalty of £5, besides forfeiting the boat, net, or other engine used to catch the fish. Though the law is as above stated with respect to fishing salmon with nets, yet no grant from the crown is required to enable a riparian owner to angle for salmon. Hence the right of angling for salmon passes as a pertinent of the property in the banks, and each owner is entitled to angle up to the middle of the stream. Anglers who are not riparian owners, and who have no permission from such, are therefore all poachers, and incur a penalty. The Scotch Salmon Fishery Act of 25 and 26 Vict. c. 97 contains prohibitions, like the English act, against owners of fisheries and others fishing salmon by fixed engines during close-time, &c. As regards other fish than salmon, the general rule is, that the riparian owner is entitled to catch all the fish he can, provided he do not interfere with the superior right of some crown grantee of the salmon-fishery. A person who poaches

trout or other fresh-water fish with a net, or by double-rod fishing, or cross-line fishing, or set lines, &c., incurs a penalty of £5, besides forfeiture of the fish caught. And he may be arrested if he is net-fishing, but not if he is fishing in another way. Moreover, a mere angler of trout, though a poacher, cannot be arrested, nor yet punished by any penalty; though he is liable to an action at law, which, however, is virtually no remedy at all. So, in the case of all poachers of trout (except angling poachers, who can neither be arrested, nor yet have their fish or fishing-rod taken from them by force), the owner of the fishery, or any person authorised by him, may seize the nets, boats, and fishing implements, if the poachers are found on the spot. Though angling for trout is thus privileged in Scotland above what it is in England in this respect, that the poaching angler cannot be arrested or fined by justices of the peace, but is only liable to an action, yet the poaching angler of salmon may be fined. The public have no right to angle from a highway adjoining a stream. Where a stream runs through a farm, the farmer has a right to angle for trout, unless the lease expressly forbid it; but he cannot fish for salmon with a net, or even by angling, for it interferes with the crown grantee, if there is one. It has also been held that he cannot fish for trout with a net, but this decision is supposed to be unsound, and would probably be reversed, if the point were raised. There is a special salmon statute for the river Tweed, and for the Solway and the Scotch rivers running into these, and for some other rivers; but these statutes do not substantially differ from the general law. In Ireland, the law of poachers of fish is the same as in England in all the main points. See the whole subject explained in Paterson's *Fishery Laws of the United Kingdom*.

POCAHONTAS. The legendary 'Princess Pocahontas,' born about 1595, was the daughter of an Indian chief of Virginia. It is due to the vanity of Captain John Smith, a bustling early settler, that this red Indian woman has been embalmed in his figmentary story as a heroine of romance in that she died of love for the said John Smith, years after she had prevented her father's braves from beating out his brains at the imminent risk of a similar visitation on her own; a fond imagination perpetuated in sculpture by Capellano, as may be seen any day over one of the doors of the Capitol at Washington. But Mr E. D. Neill has recently dispelled the halo from the brow of this 'Blessed Pocahontas, the Great King's Daughter, of Virginia.' According to evidence adduced by this gentleman, P. first appears in history tumbling wheels in the market-place of the English fort—a prototype of our city Arabs. Next she is living with a volunteer captain named Cookham. Subsequently separated from him, she is betrayed by her uncle Patowomek (Potomak?) to Captain Argall, the unscrupulous deputy-governor of Virginia, and held by him as a hostage for the purpose of extorting from her father such terms as he required. In pursuance of this plan, John Rolfe, a married Englishman, marries her. Sir Thomas Dale, the governor, afterwards brings the 'Virginian Princess' to England, as a means of extracting money from the government of James I. for the plantation. She created a sensation of curiosity in London and at court, and died at Gravesend in 1616, aged 21. The son she bore to John Rolfe returned to Virginia. Richard Randolph, son of an 'esteemed and industrious mechanic,' is said to have married Jane Bolling, the great-granddaughter of Pocahontas, and the latter is accordingly proudly referred to as an ancestress of the Randolphs and other distinguished families of the state of Virginia. See *English Colonisation of America*, by E. D. Neill (1871).

PO'CHARD (*Fuligula*), a genus of ducks, of the oceanic section (see DUCK), having the bill as long, or nearly as long as the head, broad and very flat, a little dilated towards the tip, the lamellæ of the upper mandible not projecting beyond the margin, the wings and tail short, the tail rounded. The windpipe of the male, in all the pochards, terminates in a labyrinth composed partly of bone and partly of membrane. There are numerous species, some of them natives of the arctic regions; some found, at least in winter, on the coasts of most parts of Europe, Asia, and North America; and some in the southern hemisphere.—The COMMON P. (*F.*—or *Nyroca*—*ferina*), also known as the DUN BIRD, and as the

Pochard (*Fuligula ferina*).

Red-headed Poker and Red-eyed Poker, is a frequent winter visitant of Britain. It breeds in very northern regions; and is abundant in all of them, but in winter migrates southwards, in America as far as Carolina and Louisiana, whilst in Asia it has been found even in Bengal. It is smaller than the mallard, but rather larger than the wigeon. The head and neck are bright chestnut, the eyes red, characters which at once distinguish it from every other British duck. It is highly esteemed for the table. Great numbers are sold every winter in the London market.—Several other species are reckoned among British birds.—The TUFTED DUCK (*F. cristata*) is a frequent winter visitant of the bays, estuaries, and lakes of Britain. It is a plump and short bird; black, with a white bar on the wing; the breast, belly, and sides white. The occipital feathers are elongated.—The CANVAS-BACK DUCK (*F. Valisneria*) of North America is a species of pochard.

Canvas-Back Duck (*Fuligula valisneria*).

It is very like the Common P., but is much larger, and has the bill higher at the base, and less dilated towards the tip. The upper parts are also whiter. The Canvas-back Duck breeds in the northern parts of America, and migrates southward in flocks in autumn. In winter, it abounds particularly on the

Chesapeake and its tributaries, and is also common southward to New Orleans, often collecting in very large flocks, particularly towards evening. It is very shy, but vast numbers are killed, it being in very high esteem for the excellence of its flesh.

PO'CO (Ital.), a little, a term much used in Music, as *poco animato*, rather animated; *poco forte*, abbreviated *pf.*, rather loud; *poco a poco*, signifies by degrees, little by little; *poco a poco crescendo*, becoming loud by degrees; *poco a poco rallentando*, becoming slower by degrees.

POD. See **LEGUME**.

PO'DAGRA. See **GOUT**.

PODA'RGUS, a genus of birds of the family *Caprimulgide*, nearly allied to the true Goat-suckers (q. v.), but having no connecting membrane at the base of the toes, and the middle toe not pectinated. Some interesting species are natives of Australia, strictly nocturnal in their habits, and remarkable for the difficulty with which they are roused from their sleep by day. *P. humeralis* may be pushed off a branch, and seems scarcely to waken so as to save itself from falling to the ground; and if two are sitting together, as is usually the case, one may be shot without its mate being much disturbed. But by night this bird is all activity.—Another species, *P. Cuvieri*, disturbs the night by a hoarse cry, resembling the syllables *More Pork*, by which name it is therefore known in New South Wales.

PODESTÀ (Lat. *potestas*, power), an Italian municipal magistrate. The name was first applied to foreign magistrates with supreme authority, whom the Emperor Frederick Barbarossa placed over the Italian towns on subjugating them. In the 13th and 14th centuries, an officer bearing the same designation appears, at first occasionally, like the Roman dictator, afterwards in most Italian cities as a permanent magistrate, appointed either by the constituent parliament, or by the Great Council; he superseded all the ordinary magistrates, the military officers, and occasionally the judges. The cause of appointing such an officer was the jealousy that subsisted between the richer citizens and the nobles; the podestà was a stranger, generally belonging to the nobility, and prohibited, during his term of office, from forming any intimate connections in the city which he governed. His chief duty was the execution of summary justice on the lawless barons; and in the great Lombard towns, he generally obtained a predominance for the citizens. Occasionally, however, the podestà became too strong for both parties, securing his re-election during a succession of years, and becoming the despotic ruler of the city.

Podestà is the name now given in many Italian towns to an inferior municipal judge.

PODGORI'TZA, a town of European Turkey, in Albania, 35 miles north of Scutari, close to the frontier of Montenegro. It is fortified, and contains a population of 6000, almost all of whom are Mohammedans.

PO'DICEPS. See **GREBE**.

PODIEBRAD AND KUNSTAT, **GEORGE BOZCKO OF**, son of Herant of Kunstat and Podiebrad, a powerful and influential Bohemian noble, of the Hussite party, was born in 1420. While still a youth, he threw himself, with all the ardour and resolute force of his nature, into the Hussite struggles. Like the rest of his family, however, he adhered to the moderate party of the Hussites during the government of King Sigismund; but when, on the death of that monarch, the Catholic barons

(1438) carried the election of Albrecht V. of Austria (II. of Germany), P. allied himself with the Utraquist Orders in Tabor, and offered the sovereignty of Bohemia to Casimir, king of Poland. Albrecht immediately declared war against him, and invested Tabor, but was forced by P. to raise the siege, and retire to Prague. From this time, P.'s influence was firmly established among the Utraquists; after Lipa, he was the first man of the party. When Albrecht died in 1439, Lipa was appointed regent during the minority of the new king Ladislas; but five years later, Lipa himself died, and P. obtained the government of the country. He, however, was not satisfied. His ambition was to acquire the royal dignity. In 1449, he one night seized the capital, drove away all the Catholic barons, and even imprisoned his colleague in the regency, Meinhardt von Neuhaus. This outrage led to a year or so's fighting—the final result of which was that P. was acknowledged governor or regent by the whole of Bohemia. On the death of Ladislas in 1457, P. managed to get himself chosen his successor, and was crowned 7th May 1458. From this period he began to display the full power and strength of his administrative genius. He reorganised the forms of education and religion, and strove to bring about a peaceful settlement of the religious dissensions that had desolated the land. He even went the length of respectfully soliciting the papal co-operation in his humane endeavours; but his Holiness would have no dealings with this Samaritan ruler, and in December 1463 publicly proclaimed him a heretic. All the neighbouring princes sent letters to Rome, exhorting or imploring the pope to moderation; but the only answer which Pius II. gave them was placing P. under the ban of the Vatican. Shortly after, Rudolf, the papal legate, excited the Catholics of Bohemia to insurrection. P. tried every means of conciliation, but in vain. In September 1466, a German Catholic army burst into Bohemia, but this host of pseudo-crusaders was annihilated at Riesenberg. Once more Pius excommunicated P.; and in addition, he induced Mathias (q. v.) of Hungary to invade Moravia. The Bohemian king appealed to a universal council, but he also prepared to meet force with force. Summoning back from abroad the banished Taborite warriors, he crushed the insurrection, and compelled his enemies to grant him an advantageous armistice. In 1467, his son Victorin, on the renewal of hostilities, invaded and devastated Austria, while the Hungarians who had invaded Bohemia were surrounded at Vilemov, and forced to cease from hostilities. In spite of the magnanimity shewn by P. on this occasion, Mathias acted falsely towards him, and in the following year had himself crowned king of Bohemia and Markgraf of Moravia. P. instantly summoned the Bohemian diet, and proposed to the assembled orders that they should take the king of Poland as his successor, while his own sons should merely retain the family possessions. By this means, he obtained the Poles for allies; the Emperor Friedrich also declared in his favour, while his Catholic subjects were reconciled to him, so that the Hungarians found it advisable to conclude a peace. P. died 22d March 1471. His sons, Victorin and Henry of Münsterberg, fell back into the ranks of the Bohemian aristocracy; but in the stormy days that followed, they rendered good service to their native land.

PO'DIUM, a pedestal continued horizontally, so as to form a low wall on which columns may be set. Like the pedestal, it has a base, die, and corona, all continued. When the podium breaks forward so as to form a pedestal for a column, it is called the Stylobate.

PODOCARPUS, a genus of trees of the natural order *Coniferae*, suborder *Taxineae*, the order *Taxaceae* of some botanists. The leaves, like those of the allied Ginkgo tree, have a remarkable resemblance to the fronds of ferns. The species are natives of New Zealand, the South Sea Islands, and the Indian Archipelago. Some of them are valuable timber trees. *P. cupressina* is one of the best timber trees of Java. It is found also throughout the neighbouring islands and the South Sea Islands. It is a beautiful tree, 50 to 80 feet high, with spreading pendulous branches; the wood is yellowish, and takes a very fine polish. *P. totarra*, the **TOTARRA** or **TOTARRA PINE**, is the most valuable timber tree of New Zealand. It grows in the southern parts of New Zealand, and its trunk has been known to attain a diameter of fully 12 feet. Its wood is equal to the best Baltic pine in durability and for ship-building. The wood of *P. elatus*, the **GAGALI** of the Fijians, is peculiarly elastic.

PODO'LIA, or **KAMINETZ**, a government of West or 'White' Russia, north of Bessarabia, and bordering on the Austrian frontier. Area, 16,350 sq. m.; population, 1,946,761. The surface is a table-land, strewn with hills, and containing many beautiful districts. Nearly three-fourths of P. is either arable or available for pasturage. Great quantities of corn and fruits, especially melons, are produced, and the fine climate is also favourable to the growth of the vine and mulberry. Hemp, flax, and tobacco are cultivated with success, and the rearing of bees is an important branch of industry. So rich and strong is the grass in the pastures or prairies, that the cattle, of which there are immense herds, can hide themselves from view in it. The population is composed of various races, who live together unmixed. The Russniaks (until lately 'bondagers' or 'serfs') form the majority, and are over a million in number; next come the Cossacks; and then the Jews, who are almost all traders and townspeople. The aristocracy are Poles; but the officials and soldiery, Russians. The government is divided into twelve districts.

PODOPHTHALMA (Gr. stalk-eyed), a name often applied to a section or sub-class of Crustaceans, part of the *Malacostraca* of Cuvier, including the orders *Decapoda* (Crabs, Lobsters, &c.) and *Stomatopoda* (Shrimps, &c.). A distinguishing character,

Sentinel Crab.

from which they derive their name, is their stalked and movable eyes. The stalks of the eyes are short in many, but very long in some, of which a beautiful example is presented by the Sentinel Crab of the Indian Ocean.

PODOPHYLLIN is the name commonly given to the resin obtained by means of rectified spirit from the root of *Podophyllum peltatum*, or *May-apple*, a plant common throughout the United States. This resin, which occurs as a pale greenish amorphous powder, has (as well as the root from which

it is derived) been introduced into the new British Pharmacopœia, in consequence of the general favour which it has experienced during the last six or eight years from the medical profession in Britain. It is an active purgative, and seems to have the power of relieving the liver by exciting copious bilious discharges. As its activity seems to vary in different patients, it is better to begin with a small dose of half a grain, which may be combined with extract of henbane, with the view of preventing its griping. It is likely to prove one of the most valuable additions to the pharmacopœia.

PODOPHYLLUM, a genus of plants variously marked by botanists in the natural order *Berberidaceae*, or made the type of a small distinct order, *Podophylleae* or *Podophyllaceae*, differing from *Ranunculaceae* chiefly in having a solitary carpel. The genus P. has 6 sepals, 6 to 9 petals, 12 to 18 stamens, a broad round stigma, seated almost on the top of the germen, and a many-seeded berry. *P. peltatum* is a perennial plant, with a solitary white flower in the axil of the two leaves; the fruit oval, an inch and a half long, smooth, yellowish, succulent, having a mawkish sweet and subacid taste. It is common in North America, growing in moist woods and on the shady banks of streams, and is known as **MAY-APPLE**, because it flowers and ripens its fruit very early in summer, also as *Hog-apple* and *Wild Lemon*. The fruit may be eaten, but is not agreeable. All the other parts are actively cathartic. See **PODOPHYLLIN**.

PODURA, a genus of small wingless insects of the order *Thysanoura* (q. v.), having a linear or cylindrical body, a distinctly articulated thorax, rather long antennæ, and a long abdomen, terminating in a tail, which divides at its extremity into two branches. They bend the tail beneath the abdomen, and by suddenly extending it, make prodigious leaps. Hence their popular name, **SPRING-TAIL**. The species of this and allied genera are numerous, and some are found on plants, some under stones and in other damp places, some on the surface of stagnant waters. Their bodies are covered with scales, which are extremely interesting objects, and are among the favourite test-objects for the powers of microscopes.

Podura villosa.

POE, EDGAR ALLAN, perhaps the finest and most original poetical genius as yet produced by America, was born at Baltimore in January 1811. Though he came of a good family, his father and mother held no higher social position than that of strolling players. They died while he was yet a mere child; and he was adopted by a Mr John Allan, a rich merchant, who had no children of his own. In 1816 the little Edgar came to England with Mr and Mrs Allan, and was sent to a school at Stoke Newington. In 1822 he returned to America, and attended an academy at Richmond in Virginia, whence he was in due time transferred to the university of Charlottesville. His talent was from the first conspicuous, but unhappily he developed along with it, and continued through life to exhibit a desperate profligacy in all kinds, almost without a parallel in the descents and degradations of genius. Expelled from the university on account of this, he returned to Mr Allan, with whom he presently quarrelled, on the ground of that gentleman's natural reluctance to become responsible for his debts. Quitting the house of his benefactor, he started for Greece, in foolish parody of Byron, to

take part in the war of independence against the Turks. Greece he did not reach; but we find him unaccountably turning up in St Petersburg, drunk and disorderly as usual, and becoming the tenant of a police-cell. The minister of the United States interested himself to procure his release, and sent him back to America. By the good Mr Allan the returning prodigal was welcomed; and on his expressing a wish to follow the profession of arms, an appointment as cadet was procured for him in the Military Academy at West Point. Almost as a matter of course, he was 'cashiered' within the year; and once more he had recourse to Mr Allan, who once more received him kindly. Presently, however, the patience even of this excellent and much-enduring man was exhausted. He had then married a second wife, and this lady an ugly rumour exists that Poe attempted to seduce. One would not willingly believe this unless on most sufficient evidence; but it is certain Mr Allan now ejected him from his premises, and would never again hold communication with him. Cast upon his own resources, he now enlisted as a private soldier, but some injudicious friends, recognising him in this position, busied themselves to procure his discharge. Some little time before this, Poe had published a small volume of poetry [*Al Aaraaff, Tamerlane, and Minor Poems*, Baltimore, 1829] and its success had been sufficient to encourage him in the attempt to live by his pen. Further to hearten himself in the business, he married a cousin of his own, Virginia Clemm, a beautiful and saintly creature, who in no very long time died, heart-broken, it is but too likely, by the erratic ways of her husband, who wrote a most musical lament for her, sold it, and drank the proceeds. Onward, from the date of his marriage, the life of Poe was that of the professed literary man, and may be chronicled in a single sentence. His brilliant and known ability readily procured him employment; and his frantic habits of dissipation, with the regularity of a natural law, insured his early and ignominious dismissal. He wrote in his drunken, desultory way, poems, tales, criticism, &c. In 1848 he delivered in New York a series of lectures on 'the Universe,' and published them in the form of a volume entitled *Eureka, a Prose Poem*. The work is of a speculative cast, and is considered by competent readers of it to display some distracted ability in that kind, and to leave its subject, 'the universe,' pretty much as Poe found it. A feeble attempt at teetotalism, which he shortly afterwards made, was indirectly the cause of his death. He joined a temperance society, and was for some months actually sober; but chancing to pass through Baltimore, he was waylaid by some ancient 'cronies,' and on the morning of Sunday, 7th October 1849, he was found dead drunk in the gutter, and carried to a hospital, where the same evening he died, at the early age of 38.

Scarce any such dark and disastrous career as that of Poe has a place in all the sad records of genius. From the sins and aberrations of a creature so obviously abnormal, we need not seek to 'point a moral.' Only, in charity, one may hope that the depravity, though terrible, might not be so utter as it seemed. There was about him a strange fascination; his friends loved him—those best who best knew him, and knew him in his wretchedest aberrations. By his wife and her mother he was regarded through all with an obstinacy of tender affection, not for an instant to be shaken.

Whatever may be thought of his morals, of his genius there will be little question. Slight in substance, small in quantity, and in range limited, its flow is remarkable for ease and gracefulness, now

trembling with passion, gay with shallow joy, or dark with a misery helpless and hopeless. Save for some traces of imitation in its earlier specimens, his verse is eminently a peculiar and individual product. In keen, clear, lyrical quality the music of Poe at his best is scarcely surpassed by that of any other poet. Not less remarkable in their way are the collection of short tales, of which he has left two volumes. Many of these are wildly and weirdly impressive, though too frequently indulging by morbid preference in ghastly and painful effects. Over very much that Poe has written, alike in prose and in verse, there broods a shadow of misery and hopeless portentous gloom, sadly significant in its relation to the dismal tragedy of his life.

POERIO, CARLO, a noble Italian patriot, was born on the 10th of December 1803. His father, Giuseppe P., Baron Belcastro, was also highly distinguished for his love of liberty and for his sufferings in her cause. Born at Belcastro, in Calabria, in 1775, he took part in the Neapolitan revolution of 1799, and suffered imprisonment on its suppression, but was released in 1802. He also took part in the revolution of 1820, for which Ferdinand handed him over to the Austrians, who assigned him as a place of abode, first Grätz, in Styria, and afterwards Florence. On the recall of the exiles by Ferdinand, in 1833, P. returned to Naples, where he spent the rest of his life, and died 15th August 1843. He left two sons, the elder, Alessandro [born in 1802, celebrated as a poet and patriot, and died (of amputation of a limb) after the battle of Mestre, 27th October 1848], and Carlo, the subject of our notice. Carlo was educated with great care under the parental roof, and trained even from infancy, by the example of his father and brother, to place the love of his country above every other affection. In 1828 he joined the liberals of Naples, and took part in the conspiracy of Avellino, for which he was imprisoned until March 1833. He was concerned in the attempt made in 1847 to extort liberty, but was discovered, and after the movement at Reggio was sent back to prison with D'Ayala, Bozzelli, De Augustinis, Assanti, and others. The revolution in Sicily, which broke out at Palermo on the 12th January 1848, set him at liberty, and he immediately gave himself to the organisation of the famous demonstration of the 27th January 1848, which was destined to produce the constitution of the 10th February. Carlo was successively nominated Director of Police, and Minister of Public Instruction; but he soon resigned, and also refused the rank of Privy Councillor, offered to him by Ferdinand. He was appointed deputy to the parliament.

On the 18th July 1849, an unknown hand left in P.'s house a note to the following effect: 'Flee without a moment's delay. You are betrayed. Your correspondence with the Marquis Dragonetti is in the hands of the government.' As there had been no such correspondence, and as it was P.'s wish to maintain the combat to the last on the ground of legality, he did not flee. On the following day he was arrested, and his house was ransacked. Six days after, a letter of Dragonetti's was given him to read, in which he spoke of an invasion by Garibaldi, instigated by Mazzini and Palmerston. The letter was a forgery of the police! P. compared it with other authentic letters of Dragonetti, and proved it to have been forged. As the government could not bring him to trial on that pretext, it had recourse to a spy, Jervolino, who accused P. of being at the head of a sect—which never existed—called the Italian Unity, which aimed at proclaiming a republic, and murdering the king and the ministers.

P. demanded to be confronted with Jervolino, but this was refused. When this accusation also fell to the ground, Peccheda, who was at the head of the police, tried to induce the others who were indicted for political reasons to denounce P. as a revolutionist, promising them liberty as the reward. His design partly succeeded. He extorted from Romeo the printer, and from Margherita some false accusations, which the fear of death caused those unfortunate persons to make. But they were of no avail, and recourse was again had to the accusation made against P. by Jervolino; and although P. brought forward many clear proofs that the informer was paid by the police to do him harm, the court paid no attention to that, nor to any other of his objections, and concluded by inflicting on him the penalty of passing 24 years in irons, and of a heavy fine.

Thus Carlo P., a minister, and a member of parliament, a man of rare genius and of exemplary life, was cast into the hulks at Nisida, dressed as a felon, and dragging 15 pounds of chains; and thence, through the suspicions of the government, who dreaded his escape, he was conveyed from hulks to hulks, from Nisida to Procida, from Ischia to Montefusco, and finally to Montesarchio. Assassins and thieves were given him as companions in order to humble him, as if the virtue of the truly great man could be sullied by the presence of miscreants and cut-throats. He indignantly spurned the proposal to petition for his liberty.

The protests of the English and French diplomats against the iniquitous state trials, which had been instituted in Naples with the sole object of condemning persons obnoxious to the king; the letters of Mr Gladstone; the constant dread of a popular rising on behalf of the condemned political offenders, and especially of P., disturbed the mind of Ferdinand II. to such a degree that he sought some means of ridding himself of the prisoners of Montesarchio. Having failed in every attempt to force them to ask pardon, he resolved to send them to America. On the 19th January 1859, P. and 86 other prisoners, among whom were Settembrini, Spaventa, Pica, the Duke of Castromediano, Braico, Schiavoni, Argentino, Pace, Damis (all of whom afterwards became members of the Italian parliament), were conveyed to Pozzuoli, and put on board of the *Stromboli*, which immediately set sail for New York. When they reached Cadiz, P. and his companions were put on board an American vessel, the captain of which, however, was induced to land them at Cork, whence they returned, by London, to Turin. In the following year P. was elected deputy by two colleges in Tuscany, and took his seat in parliament.

When Garibaldi (q. v.) had driven out the Bourbon dynasty, P. returned to Naples. He declined the ministerial office offered him by Cavour, and also the governorship of the southern provinces proposed to him by Constantino Nigra, but accepted the office of privy councillor. The privy council elected him its vice-president; then, being re-elected deputy, he was proclaimed vice-president of the parliament. He died in 1867.

POET-LAUREATE. See LAUREATE.

PO'ETRY (from the Greek *poieo*, to make, or to create), according to the mere etymology of the word, signifies a creation or production of any kind; but its classical equivalent, *poiësis*, was applied by the Greeks almost exclusively to designate the artistic productions of the imagination, expressed in language. Poetry is thus not necessarily associated—as many people seem to think

—with verse or rhyme. It may find expression in prose, and in point of fact has often done so, both in ancient and modern times. The Book of Ruth, for example, is decidedly poetical in substance, yet in form it is strictly prosaic. The same may be said of a still more remarkable degree of the Book of Job and the Prophetic Writings, as they appear in our English version. Jeremy Taylor, Hooker, Rousseau, Burke, Carlyle, Ruskin, Hawthorne, Emerson, and other modern prose writers, are often as richly or profoundly imaginative as poets by profession; but although the essence of poetry lies rather in the nature and adornment of the thoughts expressed than in the form of the composition, yet in general it has subjected itself to certain rules of *metre* or measure, and often also to rules of *rhyme*. The reason of this practice lies in the fact that the music so produced by the mere words is found to heighten the emotions which their meaning is calculated to produce, and thus furthers the end that the poet has in view. It is from this circumstance that the term poetry has become almost synonymous with metrical composition. Poetical compositions are of several kinds or classes, to which particular terms are applicable; the principal are the Epic (q. v.), the Lyric (q. v.), and the Drama (q. v.). To the first of these belongs the Ballad (q. v.); to the second belong the Song (q. v.) in all its varieties, serious and comic, the Hymn (q. v.), Ode (q. v.), Anthem (q. v.), Elegy (q. v.), Sonnet (q. v.), &c.; the third embraces Tragedy and Comedy. Besides these three principal kinds, others of less consequence may be mentioned, such as Didactic Poetry (q. v.), Satirical Poetry (see SATIRE), in which, however, imaginative and ideal elements in general mingle so sparingly that the stricter kind of critics exclude them from the circle of poetry altogether. The Germans have produced several treatises on the history of poetry, such as Rosenkranz's *Handbuch einer allgemeinen Geschichte der Poesie* (3 vols. Halle, 1832), and Zimmermann's *Geschichte der Poesie aller Völker* (Stuttgart, 1847).

POGGE (*Aspidophorus Europæus*), a fish of the family *Sclerogenidæ*, or *Mailed Cheeks*, and nearly allied to the Bullhead (q. v.), but having the body cuirassed with large bony scales from the head to the tail fin, so that it is in form nearly a pyramid with eight faces. The head is thicker than the body, with points and depressions, the snout furnished with short recurved spines. The P. is also known on the coasts of England as the *Armed Bull-head*; and on the coasts of Scotland by the names *Lyric*, *Pluck*, and *Noble*. It is pretty common on the British coasts. It is seldom more than six inches long. Notwithstanding its uncouth appearance, its flesh is good.

POGGENDORF, JOHANN-CHRISTIAN, a German physicist, was born at Hamburg, 29th December, 1796. He studied pharmacy, chemistry, and physics; and since 1834 has been professor of the last-mentioned science at Berlin. In 1838 he became a member of the Academy of Sciences. His chief discoveries have been in connection with electricity and galvanism, and these are reckoned of great value; he has also invented a multiplying galvanometer for measuring the calorific action of currents. Since 1824 he has edited the *Annalen der Physik und Chemie*, contributing to this collection many important memoirs. He was one of the triad (Liebig and Wöhler being the other two) who prepared the *Dictionnaire de Chimie* (Brunswick, 1837—1851). The first work published by himself was the *Linien zu einer Geschichte der exacten Wissenschaften* (Berlin, 1853), which proved the pre

cursor of an important *Biographisch-literarisches Wörterbuch zur Geschichte der exakten Wissenschaften* (Berlin, 1858—61).

POGONIAS, a genus of acanthopteroan fishes, of the family *Sciænidæ*, having two dorsal fins, one of them deeply notched, and many small barbels under the mouth. The fishes of this genus are found on the coasts of warm countries; and are remarkable for the sounds which they emit, which somewhat resemble those of a drum, and have obtained for them the name of **DRUMFISH**. It is not known how these sounds are produced; but sailors in vessels anchored near the shore, where species of this genus abound, are often prevented from sleeping, until they have become habituated to them. Some of the species attain a large size, one hundred pounds or more, and are excellent for the table.

POINTING (same root as Eng. *pond*), in the law of Scotland, means the seizing and selling of a debtor's goods under process of law, or under the warrant of a *debitum fundi*, in order to pay the debt. It is either real or personal. Real pointing is the attaching of goods or movables on the land over which some real or heritable security exists. It is one mode in which heritable security is made effectual. Thus, the superior of lands can point the ground to obtain payment of his feu duties; and the holder of a heritable bond can do the same in order to recover his debt. Personal pointing is the mode in which a decree of the court is made effectual by the messenger or bailiff seizing the movables of the debtor. They are then appraised or valued, and the messenger reports his execution to the sheriff, or other judge ordinary, who grants warrant to sell the goods by public roup after advertisements. The net amount of the sale is paid over to the creditor, or if no purchaser bid for them, they are delivered to the creditor at the appraised value. There is also another kind of pointing, called a pointing of stray cattle, which takes place whenever the cattle of a stranger trespass on lands, in which case the owner or occupier of the lands can seize them *brevi manu*, and keep them as a security until the damage done by the cattle is paid to the owner of the land. By an old Scotch statute, the owner of the cattle is bound to pay, besides the damage, half a merk for each head of cattle, and for the damage, penalty, and expense of keeping the cattle, the owner of the land can detain the cattle until payment. The pointer must, however, take care to keep the cattle in a proper place, and feed them. In England, the word pointing is not used, the corresponding term being *Distraining* or *Distress* (q. v.).

Point.

me parted per chevron.

POINT-BLANK. See **GUNNERY**. The point-blank range of a cannon varies from 200 to 300 yards.

POINT DE GALLE, a fortified town and seaport on the south-west extremity of the island of Ceylon, stands on a low rocky promontory of the same name, in lat. 6° 1' N., long. 80° 12' E. The harbour, formed by a small bay, the entrance to which is about a mile in width, is good, although

there are numerous rocks, and a pilot is required to conduct vessels to the anchorage. Among the principal edifices, are the fort—a mile in circumference—the old Dutch church, a Roman Catholic chapel, an excellent Orphan Asylum, barracks, and light-house, 103 feet above sea-level. This town has become important within recent years, and specially since the organisation of the Peninsular and Oriental Steam-navigation Company. Vessels plying between Suez and Bombay and Calcutta, Australia, China, Penang, and Singapore, call here to coal and to transship passengers. About 700 vessels, of 350,000 tons, enter and clear the port annually. Gold and silver ornaments, workboxes, &c., are made with great taste and nicety by the native workmen. Pop. about 50,000.

POINTED ARCHITECTURE. See **GOTHIC ARCHITECTURE**.

POINTER, a kind of dog nearly allied to the true Hounds (q. v.), but not reckoned one of them. It is remarkable for its habit of *pointing* at game; its whole body, and particularly its head, indicating the position of the game to the sportsman; and a well-trained P. will remain long immovable in the attitude of pointing, not going forward to disturb the game which its exquisite power of scent has enabled it to discover. It is recorded of two pointers that they stood an hour and a quarter

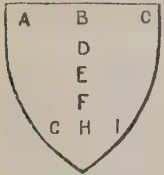

A Pointer standing at Game.

without moving, whilst Mr Gilpin painted them in the act. The P., when he scents game, stops so suddenly and completely, that even the fore-foot, already lifted, remains suspended in the air. Without the P., the sportsman would have comparatively little success in the pursuit of grouse; but the dog performs for him the laborious task of 'beating' the wide moors. Well-trained pointers will scarcely point at anything except 'game'; but inferior dogs often point at almost any living creature the odour of which affects their nostrils. The habit of pointing once acquired, appears to become hereditary, so that very young pointers often exhibit it in great perfection. It has been explained, with the crouching of the Setter, as 'the natural start of surprise or interest which all dogs give when coming suddenly upon the scent or sight of their natural prey; modified by cultivation, and by transmission through many generations, each, by education, improving upon the capabilities of the former.'—See Bell's *British Quadrupeds*.

The breed of pointers now most common in Britain is believed to be crossed with the foxhound, to which there is considerable resemblance in colours as well as in form. The figure is very muscular, the

hair short, the ears pendulous, the upper lips moderately large, the tail pointed and destitute of brush. Dogs of this breed are very active, and capable of long-sustained exertion. The original breed, the *Spanish P.*, probably brought to Spain from the East, is of more bulky form, less active habit, and less capability of continued exertion. The *P.* is very forward and familiar in its manners, but is both affectionate and intelligent, although it has a reputation of inferiority in these respects to many other kinds of dogs.

POINTS OF THE ESCUTCHEON, in Heraldry. In order to facilitate the description of a coat-of-arms, it is the practice to suppose the shield to be divided into nine points, which are known by the following names: A, the dexter chief point; B, the middle chief; C, the sinister chief; D, the collar or honour point; E, the fess point; F, the nombril, or navel point; G, the dexter base point; H, the middle base point; and I, the sinister base point. The dexter and sinister sides of the shield are so called, not in relation to the eye of the

Points of the Escutcheon.

spectator, but from the right and left sides of the supposed bearer of the shield.

POISON UDER, POISON IVY, POISON OAKS, POISON SUMACH, AND POISON VINE. See SUMACH.

POISONING, SECRET, a mode of taking away life by poisons so slow in their operation that the gradual sinking of the victims under their influence closely resembled the effects of disease or the ordinary decay of nature. It has been practised in all ages, and several undoubted and numerous supposed instances of it are mentioned by Greek and Roman writers. It was not, however, till the 17th c. that this atrocious practice became of frequent occurrence; but from this time it rapidly increased, spread over Western Europe like an epidemic, and became gradually a regular branch of education among those who professed a knowledge of chemistry, magic, or astrology. These persons regarded the knowledge of the mode of preparing secret poisons as of the highest importance, and many of them realised large sums by the sale of their preparations, and occasionally of the secret of their composition. It was in Italy and France that this art was chiefly practised and brought to the highest perfection; but it seems also to have prevailed in England to a considerable extent, for we find that, in the 21st year of Henry VIII's reign, an act was passed declaring the employment of secret poisons to be high treason, and sentencing those who were found guilty of it to be boiled to death. The only undoubted instance of this crime which appears prominently in English history is the murder of Sir Thomas Overbury (q. v.) by Viscount Rochester (the favourite minion of James VI.) and his wife, the divorced Countess of Essex; though many suppose, and with some show of probability, that James VI. himself was a victim to similar nefarious practices on the part of Villiers, Duke of Buckingham; and undoubtedly such was the popular impression at the time, for Dr Lamb, a conjurer and quack, who was believed to have furnished Buckingham with the poisons, was seized by the angry populace in Wood Street, Cheapside, London, and beaten and stoned to death. But it was in Italy where this mode of poisoning was most prevalent. There, judging from the writings of various authors, it seems to have been looked upon as a not

unjustifiable proceeding to get rid of a rival or enemy by poison; and from the time of the Lombard invasion down to the 17th c., Italian history teems with instances which sufficiently shew that poison was both the favourite weapon of the oppressor, and the protection or revenge of the oppressed. The Borgias are generally singled out and held up to the horror and detestation of mankind; but as far as their poisonings are concerned, they merely employed this method of destroying their adversaries a little more frequently than their neighbours. To shew the popular feeling on this subject, we may instance the case mentioned in the memoirs of Henry II., fifth Duke of Guise, of a soldier who was requested to rid the duke of Gennaro Annese, one of his opponents in Naples. *Assassination* was the mode proposed to the soldier, but he shrank with horror from the suggestion, stating at the same time that he was quite willing to *poison* Annese. It was shortly after the date of this story (1648) that secret poisoning became so frequent; and the Catholic clergy, despite the rules of the confessional, felt themselves bound to acquaint Pope Alexander VII. with the extent of the practice. On investigation, it was found that young widows were extraordinarily abundant in Rome, and that most of the unhappy marriages were speedily dissolved by the sickness and death of the husband; and further inquiries resulted in the discovery of a secret society of young matrons, which met at the house of an old hag, by name Hieronyma Spara, a reputed witch and fortune-teller, who supplied those of them who wished to resent the infidelities of their husbands, with a slow poison, clear, tasteless, and limpid, and of strength sufficient to destroy life in the course of a day, week, month, or number of months, as the purchaser preferred. The ladies of Rome had been long acquainted with the 'wonderful elixir' compounded by La Spara; but they kept the secret so well, and made such effectual use of their knowledge, that it was only after several years, during which a large number of unsuspected victims had perished, and even then through a cunning artifice of the police, that the whole proceedings were brought to light. La Spara and thirteen of her companions were hanged, a large number of the culprits were whipped half-naked through the streets of Rome, and some of the highest rank suffered fines and banishment. About half a century afterwards, the discovery was made of a similar organisation at Naples, headed by an old woman of threescore and ten, named Toffania, who manufactured a poison similar to that of La Spara, and sold it extensively in Naples under the name of *acquetta*, and even sent it to all parts of Italy under the name of 'Manna of St Nicola of Bari,' giving it the same name as the renowned miraculous oil of St Nicola, to elude discovery. This poison, now best known as the 'Acqua Tofana' or 'Acqua di Perugia,' is said by Hahnemann to have been compounded of arsenical neutral salts; while Garelli states that it was crystallised arsenic dissolved in a large quantity of water; but both agree that it produced its effect almost imperceptibly, by gradually weakening the appetite and respiratory organs. After having directly or indirectly caused the death of more than 600 persons, Toffania was at length seized, tried, and strangled in 1719. From this time the mania for secret poisoning gradually died away in Italy.

About the middle of the 17th c., this horrible practice seems to have first become prevalent in France, and under similar circumstances, the agents being married women, and their husbands the victims; and as in Italy, the extent to which the

practice was carried was first made known by the clergy. The government, acting on the information thus obtained, seized and imprisoned in the Bastille two Italians named Exili and Glaser, who were suspected of having been the manufacturers and vendors of the poisons. Glaser died in prison; but Exili, becoming acquainted with another prisoner named St Croix, communicated to him his secret, which the latter made considerable use of after his release, compounding in particular the poison known as 'succession powder,' which subsequently became so celebrated. It was the same St Croix who played such a prominent part in the tragical history of the Marquise de Brinvilliers (q. v.). Penautier, the treasurer of the province of Languedoc, and the Cardinal de Bonzy, were both pupils of St. Croix, and managed, the one to pave the way for his own advancement, and the other to rid himself of his numerous creditors, by the administration of poison; but the great influence of these men, and the want of direct evidence, barred all proceedings against them. Secret poisoning now became fashionable; the passions of jealousy, revenge, avarice, and even petty spite, were all revivified in the same way, and as a necessary consequence, other offences decreased in proportion. The prisons teemed with suspected criminals, and the 'Chambre Ardente' was instituted for the special purpose of trying these offenders. In Paris, this trade was chiefly in the hands of two women named Lavoisin and Lavigoreux, who combined with the ostensible occupation of midwife that of fortune-teller, and foretold to wives the decease of their husbands, to needy heirs that of their rich relatives, taking care at the same time to be instrumental in fulfilling their own predictions. Their houses were frequented by numbers of all classes, both from Paris and the provinces, among whom were the celebrated Marshal de Luxembourg (q. v.), the Duchess de Bouillon, and the Countess de Soissons; the two former of these, however, went merely from curiosity. Lavoisin and her confederate were at last discovered, tried, condemned, and burned alive in the Place de Grève, 22d February 1680; and from 30 to 50 of their accomplices were hanged in various cities of France. So common had this atrocious practice been, that Madame de Sévigné, in one of her letters, expresses a fear lest the terms 'Frenchman' and 'poisoner' should become synonymous. For two years after the execution of the two Parisian poisoners, the crime continued to be largely committed, being fostered by the impunity with which offenders of high rank were allowed to escape; and it was not till more than 100 persons had died at the stake or on the gallows, that the government succeeded in suppressing it. The mania for secret poisoning has not since been revived to the same extent, though isolated instances of its practice have occasionally been discovered, particularly in England, where, of late years, extraordinary disclosures have at different times been made of the prevalence of this frightful crime among the labouring classes in several of the rural districts. For further information consult Beckman's *History of Inventions*, the historians of the period of James I.'s reign, the French *Causés Célèbres*, and Mackay's *Popular Delusions*.

POISONS. A poison is commonly defined to be a substance which, when administered in small quantity, is capable of acting deleteriously on the body; but this definition is obviously too restricted, for it would exclude numerous substances which are only poisonous when administered in large doses, as nitre, and the salts of lead, antimony, &c. A person may be as effectually poisoned by an ounce of nitre as by five grains of arsenic, and hence the

quantity required to kill must not enter into the definition. Dr Taylor suggests the following as the most comprehensive definition that can be given; 'A poison is a substance which, when taken internally, is capable of destroying life without acting medicinally on the system;' but this definition is not perfect, for it does not include poisons that act by absorption when applied to a thin and delicate membrane, as glanders, syphilitic poison, &c., or those which must be introduced directly into the circulation by a puncture or abraded surface, as the poison of insects, scorpions, and serpents, the wourali poison, and that of animals suffering from hydrophobia. Omitting, for the present, the consideration of the cases not included in Dr Taylor's proposed definition, we may consider poisons as divisible into three classes, according to their mode of action on the system—viz., *Irritants*, *Narcotics*, and *Narcotico-Irritants*.

The *Irritants*, when taken in ordinary doses, speedily occasion intense vomiting and purging, and severe abdominal pain. They act chiefly on the stomach and intestines, which they irritate, inflame, and frequently corrode, and may thus occasion ulceration, perforation, or gangrene. Amongst those which possess corrosive properties, are the strong mineral acids, caustic alkalis, corrosive sublimate, &c.; whilst among the pure irritants which exert no destructive chemical action on the tissues with which they come in contact, may be mentioned arsenic, cantharides, carbonate of lead, &c. The *Narcotics* act specially on the brain and spinal cord. Amongst their most common symptoms are giddiness, headache, obscurity of sight or double vision, stupor, loss of power of the voluntary muscles, convulsions, and, finally, complete coma. Moreover, many of the narcotic poisons present special symptoms, in some cases strongly resembling pure special diseases. Thus there is an almost exact similarity in the symptoms of poisoning by opium and of apoplexy, whilst prussic acid and some other poisons give rise to symptoms closely resembling those of epilepsy. These poisons have no acrid, burning taste, nor do they usually give rise to vomiting or diarrhoea, and, excepting a slight fulness of the cerebral vessels, they leave no well-marked post-mortem appearance. They are few in number, and none of them belong to the mineral kingdom. The *Narcotico-Irritants* have, as their name implies, a mixed action. 'At variable periods,' says Dr Taylor, 'after they have been swallowed, they give rise to vomiting and purging, like irritants, and sooner or later produce stupor, coma, paralysis, and convulsions, owing to their effect on the brain and spinal marrow. They possess the property, like irritants, of irritating and inflaming the alimentary canal. As familiar examples, we may point to nux vomica, monkshood, and poisonous mushrooms. . . . The fact of the symptoms occurring after a meal at which some suspicious vegetables may have been eaten, coupled with the nature of the symptoms themselves, will commonly indicate the class to which the poison belongs. Some narcotico-irritants have a hot, acrid taste, such as the aconite or monkshood; others an intensely bitter taste, as nux vomica and its alkaloid strychnia.'

For a notice of the most important rules to be observed by the physician in all cases of suspected poisoning, both with respect to the symptoms and to the inspection of the body, we must refer to any of the standard works on poisoning, or on medical jurisprudence.

Under the head of *Irritant Poisons* may be included, (1.) Mineral Acids, as sulphuric, nitric, and hydrochloric acids; vegetable acids, and other

salts, as oxalic acid, binoxalate of potash, and tartaric acid (in doses of half an ounce or more); the alkalies, as pearl-ash (carbonate of potash), soap lees (carbonate of soda), ammonia and its resquicarbonate; and metallic compounds, as white arsenic (arsenious acid), yellow arsenic (orpiment), corrosive sublimate, bichloride of mercury, permanganate and other salts of the metal, acetate of lead (sugar of lead) in doses of an ounce and upwards, carbonate of lead (white lead), sulphate of copper (blue vitriol), subacetate of copper (verdigris), arsenite of copper (commonly known as *Scheele's green* or *emerald green*, and much employed under the name of *extract of spinach* for colouring confectionery), tartarised antimony, chloride of antimony (butter of antimony), chloride of zinc (Sir W. Burnett's Fluid), nitrate of silver (lunar caustic), sulphate of iron (copperas or green vitriol), and bichromate of potash. (2.) Vegetable Substances, viz., colocynth and gamboge in large doses, savin, croton oil, the leaves and flowers of the common elder (*Sambucus nigra*), &c.; and (3.) Animal Substances, such as cantharides, to which must be added the occasional cases in which sausages, and certain fish and molluscs, usually quite innocuous, act as irritant poisons.

The *Narcotic Poisons* include opium, hydrocyanic (or prussic) acid, oil of bitter almonds, cyanide of potassium, henbane, especially the seeds, camphor, alcohol, ether, and chloroform; while *Narcotico-Irritant Poisons* are nux vomica, meadow saffron (*Colchicum*), white hellebore, foxglove, common hemlock, water hemlock (*Cicuta virosa*), hemlock water-dropwort (*Enanthe crocata*), fool's parsley, thorn-apple, monkshood or wolf's bane, deadly nightshade, tobacco, Indian tobacco (*Lobelia inflata*), the bark and seeds of the common laburnum, the berries and leaves of the yew-tree, and certain kinds of mushrooms.

The cases in which there are antidotes qualified to neutralise chemically the action of the poison are few in number. For the *mineral acids* we must prescribe chalk or magnesia in water, with the view of neutralising them, after which milk should be given freely. The *alkalies* and their carbonates must be neutralised by vinegar and water, or lemon-juice mixed with water, after which milk should be given. For *oxalic acid* the antidote is chalk or magnesia in water, by which an insoluble oxalate of lime or magnesia is formed. For *arsenic*, the hydrated peroxide of iron has been regarded as an antidote, but its efficacy is doubtful. Vomiting should be excited by the administration of a scruple of sulphate of zinc in warm water, and after the stomach has been well cleared out, demulcent fluids, such as flour and water or milk should be given. *Corrosive sublimate* combines with albumen (white of egg), and forms an insoluble inert mass; *nitrate of silver* is neutralised by chloride of sodium (common salt) dissolved in water; *tartarised antimony* is to a great degree rendered inert by the administration of decoction of bark or gall-nuts; and *acetate of lead* is rendered inert by the administration of sulphate of magnesia, which converts it into an insoluble sulphate of lead. In all cases of suspected poisoning, in which the nature of the poison is not known, the safest course is at once to produce vomiting by sulphate of zinc, or in its absence by a dessert-spoonful of flour of mustard suspended in tepid water, and to continue the vomiting till all the contents of the stomach are discharged, after which milk should be given freely.

Most of the known gases—except hydrogen, nitrogen, and oxygen—have a poisonous action when inhaled into the lungs; but in these cases death, if it ensues, is popularly said to be due to

suffocation, although strictly speaking a person who dies from the effect of carbonic acid, or sulphuretted hydrogen, or of any other noxious gas, is in reality just as much poisoned as if he had taken oxalic acid or arsenic. *Carbonic acid* (q. v.), although seldom employed as an instrument of murder, is a frequent cause of accidental death, and in France is a common means of self-destruction. It is established by numerous experiments that air containing more than *one-tenth* of its volume of carbonic acid, will, if inhaled, destroy life in man and the higher animals. In its pure state it cannot be inhaled, because its contact with the larynx causes spasmodic contraction of the glottis; but when diluted with two or more volumes of air, it can be breathed, and produces symptoms of vertigo and somnolency; and so great a loss of muscular power, that the individual, if in an erect or sitting position, falls as if struck to the ground. The respiration, which at first is difficult and stertorous, becomes suspended. The action of the heart is at first violent, but soon ceases, sensibility is lost, and the person now falls into a comatose or death-like state. Those who have been resuscitated usually feel pain in the head and general soreness of the body for some days, and in a few severe cases, paralysis of the muscles of the face has remained. As a winter seldom passes without several deaths being recorded from coal or charcoal being employed as fuel in ill-ventilated rooms (often without any kind of chimney), it is expedient that every one should know what is to be done in such an emergency. The patient must, of course, be at once removed from the poisonous atmosphere, after which artificial respiration should be had recourse to. If the skin is warm, cold water may be poured on the head and spine; while if the surface be cold, a warm bath should be employed. When respiration is re-established, venesection will often relieve the congestion of the vessels of the brain. The inhalation of oxygen gas is said to have been of service in these cases. *Carbonic oxide*, which exists largely in coal gas, is at least as active a poison as carbonic acid, and is doubtless the principal cause of the effects produced by the inhalation of diluted gas. Both carbonic acid and carbonic oxide act as powerful narcotic poisons. *Sulphuretted hydrogen*, which occurs abundantly in foul drains, sewers, cess-pools, &c., is a gaseous poison whose effects are often noticed. Nothing certain is known of the smallest proportion of this gas required to destroy human life; but air containing only one eight-hundredth of its volume of this gas will destroy a dog; and when the gas exists in the proportion of one two-hundred-and-fiftieth, it will kill a horse. Dr Taylor states that the men who were engaged in the construction of the Thames Tunnel suffered severely from the presence of this gas, which was probably derived from the action of the water on the iron pyrites in the clay, and which issued in sudden bursts from the walls. By respiring this atmosphere, the strongest and most robust men were in the course of a few months reduced to an extreme state of exhaustion, and several died. The symptoms with which they were first affected were giddiness, sickness, and general debility; they became emaciated, and fell into a state of low fever accompanied by delirium. In this case the dilution was extreme; when the gas is breathed in a more concentrated form, the person speedily falls, apparently lifeless. It appears to act as a narcotic poison when concentrated; but like a narcotico-irritant when much diluted with air.

The action of the vapour of *hydrosulphate of ammonia*, which is also commonly present in cess-pools, &c., is probably much the same as that of

sulphuretted hydrogen. The experiments of Dr Herbert Barker shew, however, that these matters do not produce similar symptoms on dogs (*On Malaria and Miasmata*, p. 212).

Many of the gases, which are only found as products of the laboratory, are in the highest degree poisonous, as arseniuretted hydrogen, acodyl, &c.; but as few persons run the risk of inspiring them, it is unnecessary to enter into any details regarding them.

We now turn to the consideration of the poisons not included in the definition, which, for want of a better, we have adopted. The poisons that may affect the body by direct introduction into the circulation, through a puncture or abrasion, may be derived from the mineral, the vegetable, or the animal kingdom; but, with a few exceptions (as, for example, Wourali Poison, q. v.), the poisons derived from the mineral and vegetable kingdoms would act as efficiently if introduced into the stomach as if injected into the circulating blood; while the animal poisons act only by direct introduction into the blood, and are inert when introduced into the stomach. Poisoned wounds derived from the dissection of recently dead bodies, commonly known as *dissecting wounds*, are occasionally attended with most alarming symptoms, and often terminate fatally. In the case of Dr Pett, quoted by Travers in his work *On Constitutional Irritation*, the symptoms on the third day were 'a haggard and depressed countenance; violent shiverings, followed by some degree of heat; extreme alteration in appearance; countenance suffused with redness; the eyes hollow and ferreted; some difficulty of breathing, which was sudden, irregular, and amounting almost to sighing; excessive torpor, and the whole aspect resembling one who had taken an overdose of opium: on the following day there was extreme exhaustion and feebleness, and death ensued on the fifth day.' The symptoms produced by the bites and stings of insects, arachnidans, and serpents, and the treatment that should be adopted, are described in the article **VENOMOUS ANIMALS, BITES AND STINGS OF**. The poisoned wounds derived from diseased animals are sufficiently discussed in the articles **GLANDERS** and **HYDROPHOBIA**.

In point of Law, the use of poison to kill or injure a human being or certain animals, renders the poisoner amenable to the criminal courts. With regard to the sale of poisons, the legislature found it necessary to put some restrictions on one description—viz., arsenic—in order to prevent persons obtaining it with facility, and in such a manner as to avoid detection. The 14 and 15 Vic. c. 13, requires every person who sells arsenic to enter in his books the date and quantity and purpose of its use, all which particulars may be inquired into before the sale. It is not to be sold to one who is unknown to the vendor unless in presence of a witness who is known, and whose place of abode is recorded in the book. The arsenic must also be mixed with soot or indigo, in the proportion of half an ounce of soot or indigo to a pound of arsenic. Those who offend against the act incur a penalty of £20; but in ordinary prescriptions arsenic may be used in the ordinary way by duly qualified medical practitioners. There is no restriction on the sale of other poisons than arsenic. The offences committed by those who administer poisons to mankind are as follow: Whoever causes death by poison commits murder, for the means are immaterial if the death was caused by such means with a felonious intent. Where death is not caused, nevertheless whoever administers poison, or causes it to be administered to any person, with intent to commit murder is guilty of felony, and is liable to penal servitude for life, or

for not less than three years. Moreover, whoever attempts to administer poison, or other destructive thing, to any person with intent to commit murder, is guilty of felony, and is punishable in the same way. These offences are committed whether the poison administered, or attempted to be administered, does injury or not; and it is a sufficient committing of the offence if the poison is put in such a place that a party was likely, and was intended to take it. Moreover, even though murder was not intended, but merely an intent to endanger life or inflict grievous bodily harm, still the offence is felony, and is punishable by penal servitude varying from three to ten years. There is also a similar punishment for the attempt to administer any stupefying drug. Not only is it a crime to administer, or attempt to administer poison to human beings, but if cattle are maliciously killed by poison, the offence is felony, punishable by penal servitude of from three to fourteen years. So to kill by poison any dog, bird, beast, or other animal, ordinarily kept in a state of confinement, is an offence punishable by justices of the peace with imprisonment for six months, or a fine of £20 over and above the injury done. If any person lay poison on lands to kill game, he incurs a penalty of £10. And though tenants of farms, when entitled to kill the game on the estate, may kill hares without having taken out any game certificate, yet they are prohibited from killing such hares by poison. Moreover, by a recent act, 26 and 27 Vic. c. 113, extending to the United Kingdom, whoever sells, or offers to sell poisoned grain, seed, or meal, incurs a penalty of £10. Whoever sows, lays, or puts on ground such poisoned grain incurs a like penalty. The use of poisoned flesh is also prohibited. But the sale or use of any solution, infusion, material, or ingredient for dressing, protecting, or preparing any grain or seed for agricultural use only is not interfered with.

POISSON, SIMEON D. See SUPP. in Vol. X.

POITIERS, earlier *Poitiers*, a corruption of the Latin *Pictavium*, so called by the Gallic tribe, the *Pictavi*, who inhabited the district in Cæsar's time, is one of the oldest towns in France; it is the capital of the department of Vienne, and formerly of the province of Poitou. It occupies the summit and slopes of a little eminence, round the base of which flow the Clain and the Boivre, is encircled by walls and towers, and has a very dull appearance. Pop. 31,034. It is connected by railway with Tours, from which it is 63 miles distant, and Bordeaux. Before the revolution, P. had an immense number of churches, chapels, monasteries, and nunneries; even yet these are sufficiently numerous. The principal are the church of St Jean (now converted into a *Musée*), one of the oldest Christian monuments in France; and the cathedral of St Pierre, one of the finest in France, belonging (in part) to the 12th c., and in which, or in the older edifice that occupied its site, 23 councils were held—the first in the 4th, and the last in the 15th century. It also contains the ashes of Richard Cœur-de-Lion. Its university, founded by Charles VII. in 1431, was also abolished after 1789, but its place has been supplied by a university-academy with two faculties. P. possesses, besides, a very celebrated lyceum, and a variety of other educational institutions, a public library of 25,000 vols. and MSS., a museum, and several learned societies, of which the most distinguished is that for the cultivation of the antiquities of Western France. In and around P. are numerous Celtic and Roman remains. In the vicinity, Alarie II., the Visigoth, was defeated and slain by Clovis in 507. Somewhere between P. and Tours a great battle took place in 732, between the

Franks under Charles Martel (q. v.) and the Moors under Abd-ur Rahmân. The Moors were routed with enormous slaughter—375,000 of them (according to one old exaggerating chronicler) being left dead on the field; later still (in 1356), at Mau-pertuis-le-Beauvois, about 5 miles north of P., Edward the Black Prince, with some 12,000 or 14,000 Englishmen and Gascons, beat 60,000 of the troops of King Jean of France, and took the monarch himself and one of his sons prisoners.

POITOU, a former province of Western France, is now mainly comprised in the departments of Deux Sevres, Vendée, and Vienne. It was divided into Upper and Lower P., and had for its capital Poitiers (q. v.). P. first became a possession of the English crown when Eleanor, Countess of P. and Duchess of Aquitaine, after her divorce from Louis VII. of France in September 1151, married, on Whitsunday following, Henry of Anjou, afterwards Henry I. of England. Philippe-Auguste reconquered the province in 1204, and in 1295 it was formally ceded to France. By the peace of Bretigny, in 1360, it again reverted to England, but was soon after retaken by Charles V., who gave it to his brother, the Duke of Berri. It was subsequently incorporated with the French crown.

POITRINAL, or PECTORAL, in ancient armour, was the horse's breastplate, formed of metal plates riveted together as a covering for the breast and shoulders.

POLA, the most important naval station of Austria, and one of the most beautiful havens in Europe, belongs to the Markgratate of Istria. The town occupies an eminence overlooking the Adriatic Sea, 75 miles by sea south of Trieste. The bay is thoroughly sheltered, and is spacious enough to accommodate the largest fleet. The town is surrounded by bastioned walls, is protected by numerous batteries, and is overlooked by the citadel by which it and the bay are commanded. Pop. about 20,000.

P., a very ancient town, is said to have been founded by the Colchians, who were sent in pursuit of Jason. It was destroyed by Julius Cæsar, but rebuilt by Augustus at the request of his daughter Julia, on which account it was named *Pietas Julia*. In ancient times it had 30,000 inhabitants, and was a station of the Roman fleet. It contains numerous and interesting Roman remains, among which are a beautiful and well-preserved amphitheatre, 436 feet long, and 346 broad. A temple and several ancient gates are also extant. See Allason's *Antiquities of Pola* (Lond. 1819).

POLA'CCA, or POLONAISE, a Polish national dance of slow movement in $\frac{3}{4}$ time. It always begins and terminates with a full bar, and a peculiar effect is produced by the position of its cadence, the dominant seventh in the second crotchet of the bar preceding the triad on the third crotchet:

The characteristic

features of the polacca are sometimes adopted in a Rondo, or other lively and brilliant composition, which is then said to be written *Alla Polacca*.

POLACCA, or POLACRE, a species of vessel in use in the Mediterranean, with three masts and a jib-boom; the fore and main-masts being of one piece ('pole-masts'), and the mizen-mast with a top and top-mast. They generally carry square sails, though a few are rigged with a peculiar form of

sail to which the term *polacre* is also applied. The fore and main-masts have, of course, neither tops, caps, nor cross-trees.

POLAND, called by the natives *Polska* (a plain), a former kingdom of Europe—renowned, in mediæval history, as the sole champion of Christendom against the Turks; and more recently, and at present, an object of general and profound sympathy throughout Western Europe, from its unprecedented misfortunes—was, immediately previous to its dismemberment, bounded on the N. by the Baltic Sea from Danzig to Riga, and by the Russian provinces of Riga and Pskov; on the E. by the Russian provinces of Smolensk, Tchernigov, Poltava, and Kherson; on the S. by Bessarabia, Moldavia, and the Carpathian Mountains; and on the W. by the Prussian provinces of Silesia, Brandenburg, and Pomerania. Its greatest length from north to south was 713 English miles; and from east to west, 693 miles, embracing an area of about 282,000 English square miles; an area which, in 1859, had a population of 24,000,000. This extensive tract forms part of the great central European plain, and is crossed by only one range of hills, which springs from the north side of the Carpathians, and runs north-east through the country, forming the water-shed between the Baltic and Black Sea rivers. The soil is mostly a light fertile loam, well adapted for the cereal crops, though here and there occur extensive barren tracts of sand, heath, and swamp, especially in the eastern districts. Much of the fertile land is permanent pasture, which is of the richest quality; and much is occupied with extensive forests of pine, birch, oak, &c. Rye, wheat, barley, and other cereals, hemp, wood and its products, honey and wax, cattle, sheep, and horses, inexhaustible mines of salt, and a little silver, iron, copper, and lead, constitute the chief natural riches of the country; and for the export of the surplusage of these products, the Vistula, Dnieper, Duna, and their tributaries afford extraordinary facilities.

The kingdom of P., during the period of its greatest extent, after the accession of the grand-duchy of Lithuania in the beginning of the 15th c., was subdivided for purposes of government into about 40 palatinates or voivodies, which were mostly governed by hereditary chiefs. The people were divided into two great classes—nobles and serfs. The noble class, which was the governing and privileged class, included the higher nobles, the inferior nobles (a numerous class, corresponding to the knights, gentry, &c., of other countries), and the clergy, and numbered in all more than 200,000; the serfs were the merchants, tradesmen, and agriculturists, and were attached, not, as in other countries, to masters, but to the soil. The serfs were thus much less liable to ill-usage, and retained more of human energy and dignity than the generality of slaves. The nobles were the proprietors of the soil, and appropriated the larger portion of its products, the serfs in many cases receiving only as much as was necessary for the support of themselves and their families. The nobles were chivalrous, high-spirited, hospitable, and patriotic; the serfs, who had also a stake, though a small one, in the independence of the country, were patriotic and good-natured, but indolent and sluggish.

The present population of the provinces included in the P. of former days consists of Poles, Lithuanians, Germans, Jews, Russians, Roumanians, gipsies, &c. The Poles, who number 15,600,000, form the bulk of the population; the Lithuanians, 2,100,000 in number, inhabit the north-east of the country; the Germans, of whom there are 2,000,000, live mostly in towns and villages by themselves, and bear the usual character for economy, industry, and that excessive

love and admiration for the 'Fatherland,' which guided their politics during the last days of Polish independence; the Jews are very numerous, being reckoned at 2,200,000, but here they are poorer and less enterprising than in other countries; the remainder is composed of Russians (who are few in number, excepting in some of the eastern districts), Russian soldiery, Roumans, gipsies, Magyars, &c. The professors of religion are divided among the Roman Catholics, who form the bulk of the population; Greeks, United and Non-united; Protestants (mostly Lutherans and German); and Jews, Armenians, Moslems, &c.

History.—The Poles are a branch of the Slavic (q. v.) family. The name appears first in history as the designation of a tribe, the Polani, who dwelt between the Oder and Vistula, surrounded by the kindred tribes of the Masovii, Kujavii, Chrobates, Silesians, Obotrites, and others. In course of time, the Polani acquired an ascendancy over the other tribes, most of whom became amalgamated with the ruling race, whose name thus became the general designation. Polish historians profess to go as far back as the 4th c.; but the lists of rulers which they give are probably those of separate tribes, and not of the combined race now known as Poles. At any rate, the history of P., previous to the middle of the 9th c., is so largely adulterated with fables, as to be little trustworthy. Ziemowicz, said to be the second monarch of the Piast dynasty, is considered to be the first ruler whose history is to any extent to be relied upon; and it was not till a century after, when his descendant, Miecislav I. (962—992), occupied the throne, and became a convert to Christianity, that P. took rank as one of the political powers of Europe. Miecislav (as was the general custom among the Polish rulers) divided his dominions among his sons; but one of them, Boleslav I. (992—1025), surnamed 'the Great,' soon re-united the separate portions, and extended his kingdom beyond the Oder, the Carpathians, and the Dniester, and sustained a successful war with the Emperor Henry II. of Germany, conquering Cracovia, Moravia, Lusatia, and Misnia. He also took part in the dissensions among the petty Russian princes. Under him, P. began to assume unity and consistency; commerce, the impartial administration of justice, and Christianity, were encouraged and promoted; and about the same time, the distinction between the nobles or warrior class (those who were able to equip a horse) and the agriculturists was distinctly drawn. Boleslav was recognised as 'king' by the German emperors. After a period of anarchy, he was succeeded by his son, Casimir (1040—1058), whose reign, and that of his warlike son, Boleslav II. (1058—1081), though brilliant, were of little real profit to the country. The latter monarch having with his own hands murdered the Bishop of Cracow (1079), P. was laid under the papal interdict, and the people absolved from their allegiance; Boleslav accordingly fled to Hungary, but being, by order of the pope, refused shelter, he is said to have committed suicide (1081). Boleslav III. (1102—1139), an energetic monarch, annexed Pomerania, defeated the pagan Prussians, and defended Silesia against the German emperors. A division of the kingdom among his sons was productive of much internal dissension, under cover of which, Silesia was severed from P., though still nominally subject to it. Ultimately, Casimir II. (1177—1194) re-united the severed portions, with the exception of Silesia, and established on a firm footing the constitution of the country. A senate was formed from the bishops, palatines, and castellans, and the rights of the clergy and of the peasantry were accurately defined. His death was the signal for a contest among the

various claimants for the throne, which was speedily followed, as usual, by a division of the country, and during this disturbance Pomerania emancipated itself from Polish rule. About the same time, the Teutonic Knights were summoned by the Duke of Masovia to aid him against the pagan Prussians; but they soon became as formidable enemies to P. as the Prussians, and conquered great part of Podlachia and Lithuania. The Mongols swept over the country in 1241, reducing it to the verge of ruin, and defeating the Poles in a great battle near Wahlstatt. From this time, P. began to decline; various districts were ceded to the markgrafs of Brandenburg, while many districts began to be colonised by Germans. Numbers of Jews, persecuted in Western Europe about this time, took refuge in Poland. Wladislas (1305—1333), surnamed *Lokietek* (the Short), again restored unity to the country, judicial abuses and all illegally acquired privileges were abolished, and the first diet (1331) assembled for legislative purposes. In conjunction with Gedymin, Grand Duke of Lithuania, a vigorous war was carried on against the Teutonic Knights, on returning from which the aged monarch (he was now 70 years old) experienced a triumphant reception from his subjects, who hailed him as the 'father of his country.' His son, Casimir III., the Great (1333—1370), greatly increased the power and prosperity of P. by cultivating with zeal the arts of peace, amending the laws, and consolidating his territories by profitable exchanges with the neighbouring powers. In the latter part of his reign, he was compelled to defend sundry new acquisitions against the Tartars, Lithuanians, and Wallachians, which he did successfully. With Casimir, the Piast dynasty became extinct, after a sway of 510 years, according to the old Polish chroniclers. His nephew, Lewis the Great, king of Hungary, succeeded him, by the will of the deceased monarch and the election of the diet; but during his reign, P. was treated merely as an appanage of Hungary. On his death without male heirs, the crown fell to Jagello (Wladislas IV.), Grand Duke of Lithuania, the son-in-law of Lewis, who founded the dynasty of the *Jagellons* (q. v.) (1386—1572), and for the first time united Lithuania and P., thus doubling the extent, though not the population of the kingdom. However, his successor, Wladislas V., was acknowledged only in P. proper, the Lithuanians preferring the rule of the younger son, Casimir. Wladislas was also chosen king of Hungary, and fell at the battle of Varna (q. v.), being succeeded in P. by Casimir IV. (1444—1492), who again united it to Lithuania. Casimir recovered West Prussia from the Teutonic Knights, and compelled them to do homage for East Prussia, rewarding the inferior nobles, or warrior class, with more extensive privileges, putting them on an equality of rank with the great chiefs of the realm, and at the same time necessarily oppressing the peasantry. Manufactures and commerce revived to a wonderful extent during his reign in the western provinces. The brief reigns of his three sons were marked only by the increased power of the two houses of the diet, which had by this time absorbed all but the symbols of supreme authority, and had converted P. from a monarchy to an oligarchy (the king possessing little power beyond what his personal influence gave him). Sigismund I. (1506—1548) surnamed the Great, the fourth son of Casimir, raised the country to the utmost pitch of prosperity. Generous and enlightened, he was beloved by the masses, whom he endeavoured to benefit physically and mentally, while his firmness and justice commanded the respect of the turbulent nobles. He wisely kept aloof from the religious quarrels which distracted Western Europe, by allowing his subjects perfect freedom of

choice in matters of religion; he was, however, forced into a war with Russia, in which he lost Smolensk; but he was partly compensated by obtaining lordship over Moldavia. His son, Sigismund II., Augustus, was a successor worthy of him. During his reign many abuses were rectified, and the extraordinary privileges of the higher nobles were curtailed or abolished; Lithuania was finally joined indissolubly to P., and from this time there was to be but one diet for the united realm; each retained, however, its own army, titles, treasury, and laws. Lithuania was at the same time reduced by the annexation of Podlachia, Volhynia, and the Ukraine, to Poland. Livonia was conquered from the Knights Sword-bearers (a community similar to, though much less distinguished than, the Teutonic Knights); and the power, prosperity, and opulence of the state seemed to guarantee its position as the most powerful state in Eastern Europe for a long time to come. The population almost doubled itself under the two Sigismunds; but this dynasty, whose sway was so happy for P., ceased with them; and the warrior class having tasted the sweets of freedom, determined to preserve it by rendering the monarchy elective. The election was made by the two chambers of the diet—viz., the senate, or chamber of the chief nobles, and the chamber of nuncios, or representatives of the inferior nobles. He who was chosen king possessed the right of assembling the diet, but had to give a list of the subjects to be discussed; and the representatives, before setting out, were instructed as to the side they were to support. The diet only lasted six weeks, and its decisions were required to be unanimous; so that if the *liberum veto* (the right of forbidding the passing of any measure) were freely exercised even by a single member, all legislation was at a stand-still. The evil effects of these regulations were not so much felt at first, as the members were characterised by honesty and zeal for the general good; but latterly, when venality and subservience to the neighbouring powers began to shew themselves, all the measures necessary for protecting P. from dependence on her neighbours were, by a few corrupt and treacherous representatives, rendered of no avail. The first elective monarch was Henry of Valois (III. [q. v.] of France), who, however, soon abandoned the throne for that of France, and was succeeded by Stephen Battery (1575—1586), voivode of Transylvania, a man of energy and talent, who carried on war successfully against the Russians, who had attempted to sieze Livonia, pursued them into the very heart of their own country, and compelled the czar to sue for peace; he also subdued the semi-independent Cossacks of the Ukraine, and to some degree introduced civilisation among them. His successor, Sigismund III. (1586—1632), who was succeeded by his sons, Wladislas VI. (1632—1648) and John Casimir (1648—1672), was of the Vasa family, and was the crown-prince of Sweden; but his election, far from cementing a bond of union between the two countries, only embittered former dissensions. These three Swedish monarchs were most unworthy successors to P.'s ablest king, as they had neither talents for governing, nor characters and sentiments congenial to a warlike nation; on the contrary, their policy was weak, tortuous, and vacillating. Yet they were always quarrelling with their neighbours, declaring war with Russia, Sweden, or Turkey, in the most imprudent and reckless manner, and often without valid pretext. But the Polish armies, though as little fostered and cared for as the other portions of the nation, were everywhere victorious; the Swedish and Muscovite armies were successively annihilated; Moscow was taken, and the Russians reduced to such an abject condition, that they

offered to make Sigismund's son, Wladislas, their czar. Sweden made a similar offer to another son of the Polish monarch; but the latter's absurd behaviour lost for P. this rich result of her great victories; and the foolish policy of the whole three not only rendered fruitless all the lavish expenditure of Polish blood and treasure, but lost to the country many of her richest provinces, and left her without a single ally; while their religious bigotry commenced that reign of intolerance and mutual persecution between the various sects which was the immediate cause of P.'s downfall. To shew the power of the Poles at this period, it will be sufficient to notice that Great P., Little P. (Galicia, Podolia, Ukraine, &c.), Livonia, Lithuania (including Samogitia and Black and White Russia, Polesia, and Tchernigov), Pomerelia and Ermeland, Courland, Moldavia, Bukovina, Wallachia, Bessarabia, and Prussia, were either integral parts of the Polish monarchy, or were subject to it. The imprudent attempts of the Swedish sovereigns to amend the constitution only excited the suspicion of the nobles, and led to a further curtailment of royal authority. During the reign of this dynasty, Wallachia and Moldavia were snatched by the Turks from under the Polish protectorate; Livonia with Riga was conquered (1605—1621), along with part of Prussia (1629), by Sweden; and Brandenburg established itself in complete independence. The Cossacks, who had been goaded almost to madness by the most atrocious oppression and religious persecution, rose in rebellion to a man, put themselves under the protection of Russia, and ever afterwards proved themselves the most inveterate enemies of the Poles. In the reign of John Casimir, P. was attacked simultaneously by Russia, Sweden, Brandenburg (the germ of the present kingdom of Prussia), the Transylvanians, and the Cossacks; the country was entirely overrun; Warsaw, Wilna, and Lemberg taken; and the king compelled to flee to Silesia. But the celebrated staff of Polish generals was not yet extinct; Czar-niecki's sword was as the breath of the destroying angel to P.'s enemies; and after being defeated in detail, they were ignominiously expelled from the country. But in the subsequent treaties, Ducal or East Prussia was wholly given up to Brandenburg; almost all Livonia to Sweden; and Smolensk, Severia or Tchernigov, and the Ukraine beyond the Dnieper, were given to Russia. Michael Wisniowiecki (1668—1674), the son of one of the group of famous generals above alluded to, but himself an imbecile, was (contrary to his own wish [for he was well aware of his own deficiencies]) elected as their next monarch; a war with Turkey, concluded by an ignominious peace, was the chief event of his reign. But the senate rejected the shameful treaty, the Polish army was again reinforced, the Polish monarch resigned the command to John Sobieski the Hetman (q. v.), and the Turks were routed with great slaughter at Choczim (1673). After some dissensions concerning the election of a successor, John (q. v.) Sobieski (1674—1696) was chosen; but his reign, though it crowned the Poles with abundance of the laurel wreaths of victory, was productive of no good to the internal administration. As Sobieski's successor, the Prince of Conti was legally elected, and proclaimed king; but the cabinet of Versailles allowed this splendid opportunity of becoming supreme in Europe to escape; and Augustus II. of Saxony, a protégé of the House of Austria, entered P. at the head of a Saxon army, and succeeded in obtaining the throne. Augustus, unlike all his predecessors, never seemed to identify his interests with those of his Polish subjects; and though he gained their hearts by promising to

reconquer for P. her lost provinces, yet this promise was chiefly made as an excuse for keeping his Saxon army in the country, in violation of the *pacta conventa* (the 'Magna Charta' of Poland). His war with the Turks restored to P. part of the Ukraine and the fortress of Kaminiac; but that with Charles XII. brought nothing but misfortune. The war with Sweden was unpopular in P.; in fact, the Poles of the eastern provinces received Charles with open arms; but his attempt to force upon them Stanislas Leszczynski as their king severely wounded their national pride. Augustus returned after the battle of Poltava (q. v.); his rival retired without a contest; a close alliance was formed with Russia, and the Russian troops which had campaigned in P. against the Swedes were, along with his Saxon army, retained. The Poles demanded their extradition, but in vain; and the Russian cabinet interfered (1717) between the king and his subjects, compelling both parties to sign a treaty of peace. This was the commencement of P.'s dependence on Russia, and her consequent decline. By the instigation of Peter the Great, the Polish army was reduced from 80,000 to 18,000; and the country was further weakened by the diffusion of effeminacy, immorality, and prodigality, through the evil example and influence of the court. Religious fanaticism also more fully developed its most odious features during his reign, and the massacre of the Protestants at Thorn (1724) and the legalised exclusion of them from all public offices was the result. The succeeding reign of Augustus III. (1733—1763) was of the same character; the government fell more and more under Russian influence, and its political relations with other countries gradually ceased. Towards the end of his reign, the more enlightened of the Poles, seeing the radical defects of the constitution, the want of a strong central government, and the dangers of the *liberum veto*, entered into a league to promote the establishment of a well-organised hereditary monarchy. But the conservative or republican party was equally strong, and relied on Russian influence; and the conflict between these parties became more embittered from the fact, that the monarchists supported the Jesuits in disqualifying all dissenters from holding public offices, while the republican party supported the dissidents. The dissidents dated their grievances from 1717, but the great conflict between them and their opponents did not break out till 1763. The cabinets of St Petersburg and Berlin now (1764) presented to the Poles Stanislas Poniatowski as their king. This gross insult, intensified by the incapacity of Stanislas for such an office, could not be borne in quiet; the king and the Russian ambassador were compelled in the diet to listen to the most spirited protests against Russian interference; but the intense national spirit of the Poles only recoiled upon themselves, for the Russian ambassador craftily incited them to insurrection, and kept alive their mutual dissensions. The monarchic or Czartoryski (so called because it was headed by a Lithuanian prince of this name) party had succeeded in abolishing the *liberum veto*, and effecting many other improvements; but they at the same time more severely oppressed the dissidents; and Russia, finding that the political policy of this party was speedily releasing P. from her grasp, joined the party of the dissidents as the champion of religious toleration! Her ambassador caused the chief leaders of the Catholic party to be secretly kidnapped, and sent to Siberia, and compelled the republicans to accept the protectorate of Russia. The 'Confederation of Bar' (so called from Bar in Podolia) was now formed by a few

zealous patriots, an army was assembled, and war declared against Russia. The confederates were supported by Turkey, which also declared war against the czarina; and Russia, alarmed at the appearance of affairs, proposed to the king and diet an alliance, which both firmly refused. Frederic the Great of Prussia, who had formerly gained the consent of Austria to a partition of P., now, in 1770, made the same proposal to Russia, and in 1772, the *first partition* was effected; Stanislas and his diet claiming the mediation and assistance of the other powers of Europe without effect. He was forced in the following year to convoke a diet for the purpose of recognising the claims of the three partitioning powers to the territories they had seized, but few members appeared, and these preserved perfect silence. The territories seized by the three powers were as follows:

	Eng. sq. Miles.	Pop.
Russia, . . .	42,000	1,800,000
Prussia, . . .	13,000	416,000
Austria, . . .	27,000	2,700,000

The whole country was now aroused to a full sense of its danger; and the diet of the diminished kingdom laboured to amend the constitution and strengthen the administration by a liberal code of laws and regulations, which gave political rights to the cities, civil rights to the peasantry, and rendered the kingly authority hereditary. In this they were encouraged by Prussia, whose king, Frederic William, swore to defend them against Russia; but in 1791, Catharine II., after great labour, obtained, by means of intrigues and bribery, the services of *five* (out of 200,000) of the Polish nobility, who protested against the new constitution which had just (May 3, 1791) been established, and drew up a document at Targowitz (q. v.), which they forwarded to the Russian court. Catharine, thus armed with a pretext for interference, advanced her army, and Prussia proving traitorous, a second fruitless resistance to the united Prussians and Russians, headed by Joseph Poniatowski (q. v.) and Kosciusko (q. v.), was followed by a *second partition* (1793) between Russia and Prussia, as follows:

	Eng. sq. Miles.	Pop.
Russia, . . .	96,000	3,000,000
Prussia, . . .	22,000	1,100,000

which the diet were forced to sanction at the point of the bayonet. The Poles now became desperate; a general rising took place (1794); the Prussians were compelled to retreat to their own country, and the Russians several times routed; but then a new enemy appeared on the scene. Austria was chagrined at having taken no part in the second partition, and was determined not to be behind-hand on this occasion; her army accordingly advanced, compelling the Poles to retreat; and fresh hordes of Russians arriving, Kosciusko, at the head of the last patriot army, was defeated; and the sack of Praga, followed by the capture of Warsaw, finally annihilated the Polish monarchy. The *third and last partition* (1795) distributed the remainder of the country as follows:

	Eng. sq. Miles.	Pop.
Russia, . . .	43,000	1,200,000
Prussia, . . .	21,000	1,000,000
Austria, . . .	18,000	1,000,000

King Stanislas resigned his crown, and died broken-hearted at St Petersburg in 1798. The subsequent success of the French against the Russians, and the tempting promises of the Emperor Napoleon to reconstitute P., rallied round him a faithful army of patriots, who distinguished themselves in the campaigns of the French against Russia and Austria; but all that Napoleon accomplished in fulfilment of his promise was the establishment,

by the treaty of Tilsit (1807), of the *Duchy of Warsaw*, chiefly out of the Prussian share of P., with a liberal constitution, and the Elector of Saxony at its head. The duchy was an energetic little state, and, under the guidance of Prince Joseph Poniatowski, wrenched Western Galicia from Austria (1809), at the same time furnishing a numerous and much-valued contingent to the French armies; but the advance of the grand allied army in 1813 put an end to its existence. After the cessions by Austria in 1809, the duchy contained 58,290 English square miles, with a population of about 4,000,000. Danzig was also declared a republic, but returned to Prussia (February 3, 1814).

The division of P. was re-arranged by the Congress of Vienna in 1815, the original shares of Prussia and Austria were diminished, and that part of the duchy of Warsaw which was not restored to Prussia and Austria was united as the *kingdom of P.* (see next article) to the Russian empire, but merely by the bond of a personal union (the same monarch being the sovereign of each), the two states being wholly independent of and unconnected with each other; and the other parts of P. were completely incorporated with the kingdoms which had seized them. The partition of P., as thus finally arranged, was as follows:

Extent in Eng. sq. Miles.			Present Political Divisions.	
Russia,	220,500	Pop. (in 1859.)	Provinces of Courland, Witebsk, Kovno, Vilna, Grodno, Minsk, Mohilev.	
Prussia,	26,000		Volhynia, Kiev, Podolia; and the <i>kingdom of Poland</i> (q. v.).	
Austria,	35,500		Posen, most of W. Prussia, and several districts in E. Prussia, Galicia, Bukovina, Zips, &c,	

while, as if in mockery of its spirit of independence, the town of Cracow, with a small surrounding territory, was declared free and independent, under the guardianship of Austria. The czar at first gave a liberal constitution, including biennial diets, a responsible ministry, an independent judiciary, a separate standing army, and liberty of the press; and he seemed to take pride in his title of king of P.; but his brother Constantine, having been appointed military governor, speedily put an end to the harmony between the czar and the Poles, and drove the latter into insurrection. Their discontent at first found vent in secret societies; but on November 30, 1830, Constantine and his Russians were driven out of Warsaw, and a general insurrection of the people, headed by the aristocracy, took place. Prince Czartoryski was appointed president of the provisional government, and military leaders, as Radzivil, Dembinski, Bem, &c., were soon found; but a general want of energy in the administration, dilatoriness on the part of the military leaders, and the checking of the spread of the insurrection till fruitless negotiations had been entered into with Nicholas, were errors fatal to the success of the Poles. From January 1831 till September 8th of the same year, a series of bloody conflicts were fought, in which the Prussians and Austrians, with pitiable subservience, aided the czar. At first, the Poles were successful; but the taking of the capital by Paskievitch (q. v.) soon ended the war, which was followed, as a matter of course, by imprisonment, banishment, confiscation, and enforced service in the Russian army. From this time, the independence of P. was suppressed, and in 1832 it was declared to be an integral part of the Russian empire, with a separate administration headed by a viceroy of the czar's choosing; the constitution and laws were abrogated; strict censorship of the press and the Russian spy police-system established in all its vigour; the country was robbed of its rich literary collections and works of art; and the most severe and arbitrary measures taken to Russianise the people. The outbreaks of 1833 and 1846 were punished by the gallows. Simultaneous disturbances (1846) in the Prussian and Austrian portions of P. were summarily suppressed; their leaders in Prussia were imprisoned, and only saved from death by the revolution of March 1848 at Berlin; and those in Austria were butchered by the peasantry, who preferred the Austrian to a national government. On the 6th of November 1846 the republic of Cracow was incorporated with Austria. After the accession of the Czar Alexander II. in 1855, the condition of the Poles was considerably ameliorated; an act of amnesty brought back many of the

expatriated Poles, and various other reforms were hoped for, when, in 1861, another insurrection broke out. Its origin is curious, and gives a thorough insight into the relations between the Poles and their Russian rulers. A large multitude (30,000) had assembled in the neighbourhood of the battle-field of Grochow (where two battles had been fought in the spring of 1831), to pray for the souls of those who had fallen; they were engaged in prayer and in singing religious chants, when they were charged by the Russian cavalry and gens d'armes, several of them killed, and numerous arrests made. This event excited intense national feeling throughout the country; and other national demonstrations, attended with similar massacres on the part of the Russians, produced such an intense dislike to the latter, that most of the Poles in the Russian service either resigned or deserted. The Russians immediately had recourse to the most severely repressive measures, forbidding all assemblages even in the churches, punishing those who appeared to mourn the death of relatives killed in the previous massacres, or who wore garments of certain shapes or colours. The application of the Polish nation to the czar (February 28) for the re-establishment of the Polish nationality, was rejected, but certain necessary reforms were promised. These reforms were on the whole very liberal, and tended greatly to allay the general excitement; but the Russian government was very naturally not trusted by the Poles, and new disturbances broke out in October of the same year. P. was then declared to be in a state of siege, and General Luders appointed military commandant under the Grand Duke Constantine, the nephew of the Grand Duke Constantine above mentioned. The country continued in a state of commotion without any very decided outbreak; attempts were made to assassinate the Grand Duke and the other Russian officials; and on January 13, 1863, Lithuania and Volhynia were also put in a state of siege. The Committee of the National Insurrection issued its first proclamation in February 1863; and a week afterwards, Mieroslavski raised the standard of insurrection in the north-west, on the Posen frontier. The Insurrection Committee continued to guide the revolt by issuing proclamations from time to time; and many districts of Augustovo, Radom, Lublin, Volhynia, and Lithuania, were speedily in insurrection. It was a mere guerrilla war, and no great or decisive conflicts took place; but the sympathy of Europe was largely enlisted on behalf of the Poles. Remonstrances from Spain, Sweden, Austria, France, and Britain conjointly and repeatedly, Italy, the Low Countries, Denmark, and Portugal, were wholly disregarded by the czar's ministers,

and mutual reprisals continued; incendiaryism and murder reigned rampant; the wealthier Poles were ruined by fines and confiscations; and the whole populations of villages were put to the sword by the Russians; while murders and assassinations marked the reign of terror of the National Committee. At last, with the officious assistance of Prussia, and the secret sympathy and support of Austria, the czar's troops succeeded in trampling out (1864) the last embers of insurrection. Great numbers of men, women, and even children, concerned in, or supposed to have favoured the revolt, were executed; crowds were transported to Siberia; and 'tranquillity' was restored, but it was the tranquillity of the desert.' In Sept., 1864, the kingdom was placed under the rule of eight military governors depending from a 'Council of State' established at Warsaw; this form of government was superseded March 22, 1867, the Council of State abolished, and the administration of the country transferred to a commission for the interior affairs of Poland sitting at St Petersburg. Finally, in 1868, by ukase of the emperor, the commission was dissolved, and the government of Poland absolutely incorporated with that of Russia.

POLAND, KINGDOM OF, a province of European Russia, which was united to that empire in 1815, though the title of kingdom was left and a peculiar form of government long continued to distinguish it from the other provinces, is surrounded by Prussia, Austria, and Western Russia or Russian Poland, and contains 48,863 English square miles, with a population (1873) of 6,356,049, of whom about 4,350,000 are Roman Catholics, 750,000 Jews, 330,000 Protestants (Lutherans and Reformed), and 250,000 Greek Church (mostly united). The surface of the country is in general very level, with now and then a hill, or rather undulation, which relieves the uniformity of the scene. In Radom, however, there is a range of hills, some peaks of which attain a height of 2000 feet above sea-level. The chief river of P. is the Vistula, which enters the country by its southern boundary, and flows first north and then north-west, making its exit near Thorn; two of its tributaries, the Wieprz and the Pilica, belong wholly, and a third, the Bug, partially to Poland. The Warta, one of the tributaries of the Oder, drains the west, and the Niemen, the north-east districts. The Vistula and the Niemen are wholly navigable in P.; and the Bug, Narew, and Warta are so for a considerable portion of their course. By these means of communication, the exports of the country are collected at Danzig, Stettin, Memel, and Tilsit, on the Baltic, and the imports introduced into the country. The climate is severe, the summers being very hot, and the winters excessively cold. The soil very much resembles that of the other parts of the former kingdom of Poland, producing magnificent crops of wheat, rye, barley, oats, and buckwheat, the usual leguminous plants, hemp, tobacco, flax, and orchard-fruits. Upwards of 13,000 square miles are covered with forests, and fully 8000 square miles are waste, and covered with heath, sand, or swamp. Since 1867, Poland is divided for administrative purposes into 10 governments, viz:

Governments.	Eng. sq. miles.	Pop.
Kalisch,	4197	687,371
Kielce,	3621	536,146
Lomza,	4400	495,105
Lublin,	6250	734,018
Piotrkow,	4484	682,495
Plock,	3995	490,143
Radom,	4755	546,945
Siedlce,	5295	550,103
Soovalki,	4650	542,750
Warsaw,	5438	1,090,973
	47,090	6,356,049

The population is about 128 to the square mile,

being more than three times as dense as that of the rest of European Russia. A large proportion of the country population employ themselves in the rearing and breeding of horses, cattle, and pigs; sheep are not so common; but swarms of bees abound, and there is a large export trade in honey. The population of the towns is largely employed in wool-spinning and the manufacture of woollen cloth, cotton and linen spinning and weaving, the production of liqueurs, oil, vinegar, glass and earthenware, paper, beer and porter, &c. The most of the commerce is in the hands of the Jews. P., which had a separate government till 1864, was deprived in that year of the last remnant of its administrative independence. After the suppression of the revolt (see preceding article), the country was placed under 8 military governors; in 1867, the administration was committed to a commission sitting at St. Petersburg; and by an ukase, dated February 23, 1868, the government of P. was absolutely incorporated with that of Russia. The total value of Polish industries in 1873 was £12,000,000, a very large sum, considering that the population is chiefly agricultural. In the same year the commerce of P. reached £25,683,874. The Warsaw daily press has an issue of 24,000 copies, and there are 31 scientific and literary periodicals, besides newspapers in other towns.

POLAR CIRCLE, or ARCTIC CIRCLE. See ARCTIC.

POLAR EXPEDITIONS. Under this head are classed all those voyages of discovery which have been made towards the north and south poles, and to the regions within the Arctic and Antarctic Circles. The north polar regions present a much greater land-surface than those round the south pole, and on this account possess a higher temperature, and offer a more valuable field for discovery, for which reasons, as well as by reason of their greater proximity, polar expeditions have been far more frequently directed to the north than to the south.

Arctic Expeditions.—Polar expeditions were commenced with a view to discover a shorter route to the golden realms of the East; but the first attempts were made by coasting along the north of Europe and America. See NORTH-EAST AND NORTH-WEST PASSAGES. It was not till 1603 that the first arctic exploring expedition, consisting of one vessel, the *Godspeed*, commanded by Stephen Bennett, started for a voyage of northern discovery; and this, as well as the succeeding expeditions of Bennett, were devoted to more-hunting rather than to geographical investigation. In 1607, Henry Hudson (q.v.) was sent out by the Muscovy Company to penetrate to the north pole, but he was stopped about the north of Spitzbergen (in lat. 81° 30') by the ice. The succeeding voyages of Jonas Poole in 1610, 1611, and 1612, and of Baffin in 1613, were not primarily voyages of discovery, and they added nothing to the previous knowledge of the polar regions; but in the expedition of Fotherby and Baffin up Davis' Strait, in the following year, the latter discovered a northern outlet to the bay called by his own name, which was denominated Smith's Sound. Fotherby was sent out again in 1615, and attempted to pass through the sea which lies between Greenland and Spitzbergen, but was again baffled, and compelled to return, after correcting some erroneous observations of Hudson. These seven expeditions were all sent out by the Muscovy Company; and the cargoes of seal-skins, oil, teeth, &c., which they brought back helped to defray the expense of their outfit. For the next century and a half, the attempts to reach the north pole were

not resumed; but the extraordinary zeal in the cause of naval discovery which sprung up in the beginning of George III.'s reign, produced two renewed efforts. The first of these was made in the spring of 1773 by an expedition, consisting of two vessels, under Captain John Phipps (afterwards Lord Mulgrave), and fitted out by the Admiralty purely for scientific purposes. Phipps sailed along the shore of Spitzbergen till he was stopped by the ice at Cloven Cliff; he then coasted backwards and forwards along the ice-field for nearly a month, trying the various narrow openings, some of which were two leagues in depth, till he found one which took him into open water. By a sudden change in the climate, he was frozen in, and only extricated his ships after severe labour. The highest point to which he reached was lat. $80^{\circ} 48' N.$, less by 49 miles than the most northerly latitude attained by Hudson; and though he had a more than usual amount of difficulties to encounter, yet his failure, along with that of Captain Cook, who attempted to reach the pole by Behring's Strait, but only penetrated to lat. $70^{\circ} 45' N.$, greatly disheartened other explorers. The offer of £5000 by the British parliament to the crew that should penetrate to within 1° of the pole, awaked no competition; but in 1806, Mr Scoresby, then mate of a Greenland whaler from Hull, reached a point directly north of Spitzbergen, in lat. $81^{\circ} 30' N.$, and therefore only about 610 geographical miles from the pole. In following expeditions, the same enterprising navigator made many geographical explorations of Jan Mayen's land and the east coast of Greenland, largely adding to our knowledge of the character and products of the arctic regions. The subsequent expeditions of Buchan and Franklin in 1818, of Clavering in 1823, of Graab (Danish) in 1823, of De Blosseville (French) in 1833, may be considered as failures, as far as geographical discovery is concerned; for, omitting the French expedition, the fate of which is still involved in mystery, none of them reached so high latitudes as the previous English expeditions. After the failure of Buchan and Franklin's expedition, the impossibility of ever reaching the pole was generally accepted in this country as fact; but Mr Scoresby, in a Memoir which he communicated to the Wernerian Society, endeavoured to prove that this supposed impossibility was by no means such; in fact, that a journey to the pole could be made without any enormous amount either of difficulty or danger. The principal obstacle to be encountered being the alternation of ice-fields and water, which prevented all advance either by ships or sledges, Mr Scoresby proposed the use of a vehicle which could be used either as a sledge or boat, and recommended a team of dogs to draw it, they being lighter (for conveyance by water, and for travelling over thin ice) and more tractable than reindeer. After some time, this suggestion began to receive a considerable share of attention, and Captain Parry (celebrated for his discoveries in the polar seas north of America) was put in command of an expedition fitted out in accordance with Scoresby's plans. He sailed from England in the *Hecla*, on March 27, 1827; but it was the 22d of June before the exploring party quitted the ship, which was left on the north shore of Spitzbergen, in charge of a small crew, and betook themselves to the boats; and in spite of the advanced season of the year, they in the first two days advanced to $81^{\circ} 13'$. Here they began to encounter many difficulties; the ice-fields were small, and near each other, necessitating a constant conversion of the vehicle from a sledge to a boat, which could not be effected without unloading it, an operation

which consumed much time. This hardship, however, was endurable; but, to Parry's intense chagrin, he discovered, about the 22d of July, that the ice over which they were travelling was moving southward as rapidly as they were advancing north, so that on the 24th, after having travelled apparently 22 miles in the three previous days, they found themselves in the same latitude as on the 21st. Under these circumstances, Parry resolved to return, which he accordingly did, reaching his ship on the 21st of August. The highest point reached by him was $82^{\circ} 40'$. This was the first and last attempt to reach the pole over the ice; and though it can in no way be considered as finally settling the question of the possibility of reaching the pole in this way, it has shewn that the only way to success is that which was followed by the north-west passage explorers, who suffered themselves to be frozen in during winter, in order that they might have so much more time in the following summer for further advance, and continued this system for two or three successive years. The failure of Parry's expedition has also suggested further improvements in the arrangements for food, clothing, and transport across the ice-fields, which will be found serviceable in case of a second attempt. In 1854, two American explorers passed through Smith's Sound, and reached Cape Constitution in $82^{\circ} 27' N.$ lat., and saw north of this point a boundless open polar sea, teeming with animal life, which has not yet been explored.

Antarctic Expeditions.—The attempts to penetrate to the south pole are of very recent date, mainly because a knowledge of the southern polar regions is only valuable to Europeans from a scientific point of view. Cook and Furneaux are the first navigators who are known to have crossed the Antarctic Circle, but the former penetrated only to lat. $71^{\circ} 10' S.$, and neither made any discoveries of importance. Bellinghausen, a Russian navigator, reached lat. $70^{\circ} S.$ in 1819, and two years after, discovered Alexander's Land and Peter's Land, then the most southerly islands known. In 1823, Captain Weddell reached lat. $74^{\circ} 15' S.$, long. $34^{\circ} 16' W.$, and saw beyond him an open sea to the south, but made no important additions to our geographical knowledge. In 1831, Captain John Biscoe discovered Enderby Land; and in 1839, the sealing-schooner, *Eliza Scott*, from New Zealand, discovered Sabrina Land (q. v.); and in the same year, the United States' expedition, under Captain Wilkes, set out on a career of exploration, which resulted in the discovery (January 1840) of what he with reason supposed to be a continuous coast-line, though an ice-line of from 8 to 12 miles in width prevented him from establishing its continuity beyond dispute. The (supposed continental) coast stretched from Ringold's Knoll on the east, to Enderby Land on the west, and was distinguished by the absence of currents to disturb the ice-barrier, and by a much less precipitous character than belongs to islands. In 1840, a French expedition, under D'Urville, discovered a line of coast lying directly south from Victoria (Australia) on the Antarctic Circle. But the most important discoveries of all were achieved by Captain (afterwards Sir James) Clarke Ross, who made three several voyages in 1841—1843, discovering Victoria Land (q. v.), and tracing its coast from lat. 71° to lat. $78^{\circ} 10'$ (the highest southern latitude ever attained). In his third voyage, Ross proved that the lands discovered by D'Urville were islands of inconsiderable magnitude; and his antarctic expedition has besides supplied much important information to the students of natural history, geology, and above all of Magnetism (q. v.). Ross's geographical

discoveries have since been confirmed; but a large extent of surface within the Antarctic Circle still remains unexplored.

POLARISATION OF LIGHT. A ray of light from the sun or a lamp, which has not been reflected or refracted in its course to the eye, possesses no properties by which one *side* of it can be distinguished from another; if, for instance, it be divided into two by a colourless doubly-refracting crystal, such as Iceland spar, these two rays will be of apparently equal intensity in whatever position the crystal be placed (REFRACTION, DOUBLE). But if the ray has been reflected from a surface of glass or water, it is found that in general the intensities of the two rays into which it is divided by the doubly-refracting crystal are not only unequal, but dependent upon the position of the crystal with reference to the plane in which the light was previously refracted or reflected. This is a conclusive proof that the light has undergone some change by reflection or refraction, so that it is no longer the same all round, but possesses *sides* (in the language of Newton), or (in modern phraseology) is *polarised*. Perhaps the most complete illustration of this very important fact is to be found by using two doubly-refracting bodies—two small crystals of Iceland spar, for instance—and pasting on a side of one of them a slip of paper with a pin-hole in it. On looking through this crystal, the covered side being turned towards a bright body, we see two images of the pin-hole, *equally* bright. Look at these through the second crystal, each is in general doubled; we see four images of the pin-hole, but these are generally *unequal* in brightness; and by turning either of the crystals round the line of sight as an axis, we find that there are positions, at right angles to each other, in which only *two* images are visible. If we turn further, the lost images appear faint at first, and gradually become brighter, while the others become fainter in proportion; till, when we have completed a quarter of a revolution, the new images alone remain, the others having disappeared. From this it follows that each of the rays into which a single beam of light is decomposed by double refraction possesses *sides*, or is polarised; and to such an extent as to be incapable of being again doubly refracted in certain positions of the second crystal. By taking advantage of the difference of the refractive indices (REFRACTION) of the two rays produced by Iceland spar, and the close agreement of one of them with that of Canada balsam, Nicol constructed his ‘prism,’ which is one of the most useful pieces of polarising apparatus. It consists of two pieces of Iceland spar cemented with Canada balsam, and allows only one of the two rays produced by double refraction to pass through. When we look at a flame through two Nicol’s prisms in succession, we find that the amount of light transmitted depends on their relative position. If they are *similarly* placed, we have the maximum amount—viz., half the incident light; if they are *crossed*, that is, if one be made to rotate through a right angle from the position last mentioned, *no* light, not even the most powerful sunlight, can pass through the transparent combination. There are certain doubly-refracting bodies, such as tourmaline, iodosulphate of quinine, &c., which by absorption *split* one of the two rays into which they divide a beam of light; and which act therefore precisely as Nicol’s prism does. But they have the great disadvantage of *colouring* the transmitted light very strongly; and this renders them unfit for the study of the gorgeous phenomena of colour (perhaps the grandest displays in optics) which are produced by polarised light. But for the verification of the facts to which we now proceed, a tourmaline or a

Nicol’s prism will do equally well, and will be called the analyser. And first as to the reflection of light, a cause of polarisation first detected by Malus. If we examine by the analyser light reflected from water, unsilvered glass, polished or varnished wood, jet, &c., we find that it is more or less completely polarised; but that there is a particular angle for each substance, at which if light be reflected (see REFLECTION) from its surface it is completely polarised; that is, can be completely stopped by the analyser in certain positions, just as a ray which has passed through a Nicol’s prism. It was discovered by Brewster that this angle, called the *polarising angle*, has its tangent equal to the index of refraction of the reflecting body: or, in another form, the reflected light from a surface of glass, water, &c., is completely polarised when its direction is perpendicular to that of the corresponding refracted ray. The light reflected from the second surface of a glass plate is also completely polarised at the same angle; and one of the most useful polarisers which can be made is a pile of thin glass plates, from the surfaces of which light is reflected at the proper angle, which is for ordinary window-glass about 54° . The light which passes through the glass plates is partially polarised, and its polarisation is more nearly complete the greater the number of plates employed. And it appears that these rays are polarised in planes perpendicular to each other—i.e., that the analyser which extinguishes the reflected ray has to be turned through 90° to extinguish the refracted ray.

In order that we may arrive at some ideas as to the nature of polarisation, we must consider on the basis of the Undulatory Theory of Light (q. v.) *how* a ray of light can have sides. If we take, for a comparison, waves of sound, as we know that in them (SOUND) the particles of air move back and forward in the line in which the sound travels, we see that a beam of sound cannot possibly have sides, since the motions of the particles of air in it are precisely the same from whatever side we consider them. Next take waves in water, where we see the water rising and falling as the undulation (*not* the water) travels uniformly onward in a horizontal direction; and this at once gives the required analogy. So far as phenomena of Interference (q. v.; see also DIFFRACTION) are concerned, waves, whether in air or in water, present them, so that they merely shew us that light depends on undulations, but not the kind of undulation. But when, from the facts of polarisation, we find that a ray of light can have sides, we see that the vibrations of the luminiferous medium must be *transverse* to the direction of the ray. Common light, then, consists of vibrations which take place indifferently and in succession in all directions transverse to that of the ray; while light which is completely polarised has its vibrations limited to a *particular* transverse direction. A Nicol’s prism allows no light to pass through it except that which vibrates in a particular transverse direction, depending upon the position of the axes of the pieces of Iceland spar of which it is made. Light which has passed through one Nicol’s prism is sifted so as to contain none but such transverse vibrations, and will of course pass freely through a second prism, or be completely or partially stopped by it; according as the two prisms are similarly situated, or turned so that the directions of the vibrations they can transmit are inclined at right angles, or at any other angle.

It is not yet settled what the direction of these vibrations is in any particular case; whether they take place *in*, or *perpendicular to*, the plane of polarisation; and the point is extremely important in the theory of the subject, though not to the

explanation of the ordinary experimental results. To explain the nature of this difficulty, we merely mention the simple case of polarisation by reflection at a glass plate. Do the vibrations of the reflected ray take place *perpendicular* to the plane of reflection (i. e., parallel to the reflecting surface), or do they take place *in* the plane of reflection? Some high authorities are in favour of the latter hypothesis, but the general opinion of scientific men at present unquestionably leans to the former. Many delicate experiments have been made to decide the question, but their results have been irreconcilable with each other. From the results which we have just arrived at, it is evident that the oscillations, or vibrations of the luminiferous medium, of which light consists, are similar to those of the bob of a Pendulum (q. v.), the ray in this case being supposed to proceed vertically downwards. Polarised light consists of vibrations analogous to those of the ordinary pendulum, backward and forward in a line. But we have seen that any motion of the pendulum may be compounded of two such motions in planes perpendicular to each other. This is analogous to the decomposition of common light by a doubly-refracting crystal into two rays polarised at right angles. But we find in nature, and can produce artificially, motions of the luminiferous medium resembling exactly the elliptic, and circular, motions of the (conical) pendulum. They occur in nature in all cases of reflection from metallic surfaces, and also from the surfaces of highly refractive bodies, such as diamond, &c. The easiest artificial method

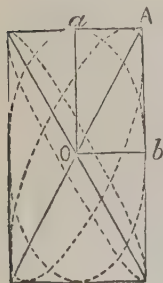

Fig. 1.

of procuring them is to allow polarised light to pass through a thin plate of a doubly-refracting crystal, such as a film of mica. Thus, if OA be the direction of vibration of the polarised light, the ray moving perpendicularly to the paper, Oa, Ob, the directions (at right angles to each other) of vibration of the two rays into which it is divided by the mica, we have only to let fall from A perpendiculars on Oa and Ob to determine the extent of the resolved vibrations in these directions. Now if the two rays moved equally rapidly through the mica, they would simply recombine on leaving it into a single plane polarised ray, whose vibrations would be represented by OA as before. But, in general, one of the rays is retarded more than the other, and the combination of two such oscillations is seen by geometrical considerations to give an ellipse whose centre is at O, and which touches each side of the rectangle of which Aa and Ab are half sides. The limiting forms of these ellipses are, of course, the diagonals of the rectangle; so that there are two cases for the light remaining plane polarised after passing through the mica, for an infinite number in which it will be elliptically polarised. Also the difference of retardation of the two rays may be such as to correspond to a description of these ellipses either right-handedly or the opposite. In particular cases the ellipse may be a circle; then it is obvious that the rectangle must become a square, that the directions of vibration of the two rays in the mica must be equally inclined to that of the original polarised ray, and that one ray must be retarded an odd number of quarter oscillations more than the other. If it be 1, 5, 9, &c., quarter oscillations, the rotation is in one direction; if 3, 7, 11, &c., it is in the opposite. Circularly polarised light cannot be distinguished by the eye, even with the

help of a Nicol's prism, from common light; but by the interposition of a thin plate of a doubly-refracting crystal, phenomena are produced which common light cannot give. Before we leave this part of the subject, it may be remarked that the composition of two equal and opposite circular vibrations produces a plane vibration, whose plane depends upon the simultaneous positions of the revolving bodies in their circular orbits. Hence a plane polarised ray may always be considered as made up of two circularly polarised rays, and if these pass through a medium which retards one more than the other, the plane of polarisation of their resultant, when they leave the medium, will in general not be the same as that of the incident ray. In other words, the plane of polarisation will have been caused to rotate through a certain angle, which will be proportional to the difference of retardation of its circular components. This is the explanation of what Biot called *Rotatory Polarisation* in quartz, turpentine, sugar, &c., and of the rotation of the plane of polarisation discovered by Faraday when a polarised ray passes through a transparent body under the action of a magnet.

In the first of these cases, the retardation is due to molecular heterogeneity; in the second, it depends upon molecular motions produced by the magnet. The effect is greater in each case the more refrangible the rays; and therefore, when the light which has passed through the medium is examined with an analyser, the successive colours of the spectrum are cut off each at a different angle, and the observed tint is that compounded of those which remain. The Saccharimeter (q. v.), for the determination of sugar in a liquid, is an application of the first case; the second has not as yet been applied to any practical purpose, but it has given most valuable information as to the ultimate nature of magnetism.

When polarised light passes through a slice of any uniaxial double-refracting crystal, nearly in the direction of its axis, it is obvious that the difference of retardation of the two rays into which it is divided will depend only upon (1) their refrangibility and (2) their inclination to the axis of the crystal. Hence, if we suppose the light to be homogeneous, the effects of interference, and subsequent application of the analyser, must be to produce appearances of bright and dark spaces, symmetrically disposed round the axis; that is, a series of concentric circular rings. The superposition of the separate sets of rings, for each colour of the spectrum, produces the appearance actually observed; a series of coloured rings, like those known as Newton's Rings, due to Interference (q. v.). Besides these, however, there is a dark or bright cross, consisting of two

Fig. 2.—Uniaxial Crystal; Black Cross.

black or white bands, intersecting each other in the common centre of the rings. The dark bands are

due to the absolute stoppage by polariser or analyser, when placed in positions 90° from symmetry, of all light whose vibrations are executed in the principal planes of the polariser and analyser. A similar explanation applies to any other case. The system of coloured rings thus produced is one of the most splendid results of optical combinations yet produced; and may be seen by any one by the help of such simple apparatus as two fragments of window-glass and a piece of clear ice from the surface of a pond. In undisturbed freezing, the axis of the ice crystal is perpendicular to the surface of the water, and the cake of ice is therefore, as it were, cut for our purpose. If light be reflected at an angle of about 54° from the first piece of glass, pass perpendicularly

through the ice, and be again reflected (at 54°) from the second piece of glass, the phenomena above described, and rudely represented in the annexed cuts, will be at once seen, the appearances varying with the relative position of the planes in which the reflections take place from the pieces of glass. If these planes be at right angles to each other,

Fig. 3.—Uniaxial Crystal; White Cross.

we have the black cross as in the first figure; if parallel, the white cross as in the second.

If, instead of a uniaxial crystal, a biaxial crystal, such as nitre or arragonite, be employed, the system of coloured rings and dark brushes is more complex; symmetry now requiring their arrangement about the two optic axes. The general appearance of the rings and brushes depends now, not only on the relative position of the polariser and analyser, but also on the position of the crystal (which is no longer symmetrical about an axis) with reference to these planes. The two following figures illustrate the nature of the change due to an alteration of the position of the crystal, the polariser and analyser being fixed in planes at right angles to each other.

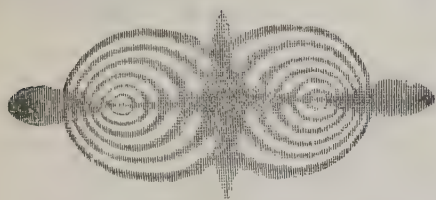

Fig. 4.—Biaxial Crystal; Black Cross.

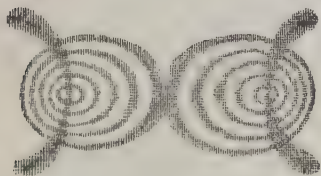

Fig. 5.—Biaxial Crystal; Black Cross changed to hyperbolas by rotating the crystal.

By employing circularly or elliptically polarised light, these appearances may be still further varied, but we cannot enter into details.

Every doubly-refracting body produces a change upon polarised light which passes through it. Hence the application of the polariser and analyser (usually glass mirrors, or Nicol's prisms) to the microscope is often of very great use in detecting crystalline, and other structural peculiarities. Solid bodies, such as glass, which are singly refractive, become doubly refractive when strained either by external forces or by unequal heating. A permanent state of strain is produced in glass when it is cooled quickly. All these phenomena are beautifully exhibited by polarised light. Again, the application of polarised light is sometimes of great importance in qualitative analysis, where only an exceedingly small quantity of a substance is procurable for examination, by enabling the chemist to determine whether a minute crystal is doubly refractive or not.

A practical application of a polarising prism may be mentioned. In salmon spearing it is often exceedingly difficult to see the fish at the bottom of the stream, on account of the glare of light reflected from the surface. But as this light is always partially, sometimes wholly polarised, a great part of it may be arrested by the analyser held in a proper azimuth; while the light escaping from the water will suffer little loss.

The light of the sky, being mainly reflected light, is of course partially polarised. The investigation of this subject has been most ably conducted by Brewster (*Trans. R.S.E.*, 1862—1863).

POLARITY. The north and south poles of the earth's axis are terms familiar to all; and so are the derived terms of the north and south poles of a Magnet (q. v.). A right-handed and a left-handed corkscrew, or helix, are also perfectly well known. The distinction between the members of any of these pairs leads us to the consideration of polarity, which it is difficult to define except by illustrations. In the case of the helix, it is the difference between right-handed and left-handed; not as in a magnet, the difference between the two ends. If we look closely into the question, we find that it is impossible to define the term 'right-handed rotation' in the abstract. We may define it as being the same as that of the hands of a watch, or that of the apparent motion of the celestial bodies about us in this northern hemisphere; but to a person at the equator, or to one who had never seen a watch, such comparisons would be without meaning. In fact, it is impossible to give a definition of even such a simple term as *right, down, east, &c.*, independent of reference to the motion or position of some external object. But there is, in many cases, an important scientific reality underlying, and perhaps causing these difficulties. To a spectator looking down upon the north pole of the earth, the axial rotation would appear to be left-handed, or opposite to that of the hands of a watch; while at the south pole the appearance is the reverse. In fact, as motion in a horizontal straight line appears to be from right to left, or from left to right, according to the side on which the spectator stands; so motion in a curve appears to be right-handed or left-handed, according to the side of its plane from which it is looked at. And this is now known to be the cause of the difference of poles in a magnet; the hypothesis of two magnetic fluids is dismissed, and Ampère's explanation, that in a magnet currents of electricity revolve round each particle in planes perpendicular to the direction of magnetisation, at once accounts for the dissimilarity of the poles. Such a figure as this gives a clear idea of the subject. A little electric current, such as that in the figure, in which positive electricity passes in the direction indicated by the arrow-head, acts upon external

bodies exactly as a small magnet would whose axis is, as in the cut, perpendicular to its plane, the arrow-head representing the north pole; that is, the pole which turns towards the South. Again, an electric current passing in a straight wire would at first sight appear to be altogether independent of polarity; yet it is found that such a current moving in

the straight line in the cut, in the direction of the arrow-head, tends to make the north pole of a magnet rotate round it in the direction indicated by the arrow-head in the circle. Again, there are certain crystals, which, when heated, become electric. One end of a prism of tourmaline, for instance, takes positive, the other negative electricity. Also certain crystals of quartz cause a ray of Polarised Light, which passes along their axis, to rotate right-handedly; others left-handedly. The difference in these cases is due to molecular arrangement, other effects of which are easily seen in the tourmaline, in the dissymmetry of the two terminals of the prism, and, in quartz, in the position of certain small faces of the crystal, so that a preliminary inspection enables us to predict the direction of the effect to be obtained from any particular specimen. The term has various other applications, amongst the least defensible of which is that to light. See POLARISATION.

POLDER, a word of frequent occurrence in the topography of the Netherlands, is the name given to a piece of land below the level of the sea or nearest river, which, being originally a morass or lake, has been drained and brought under cultivation. The usual mode of procedure is to form an embankment and canal of sufficient height to command a run towards the sea or a river, and when carried quite round, as in the case of the Haarlem Lake, the canal girdle is called the Ringvaart. At one or more points along the embankment, apparatus for lifting water, such as the screw of Archimedes, the inclined scoop or Eckhardt wheel, or pumps of large diameter, is placed, and worked by wind or steam-power. If the lake deepens towards the centre, it is necessary to have several embankments and canals, the one within the other. These are formed, at different levels, as the water-surface becomes lessened, connection being maintained on to the outer canal, which secures a run for the water which is drained off. In the Schermermeer polder, North Holland, there are four levels of canals, the land between them forming long parallelograms. The drainage water of the inner space is lifted into the first canal; that, again, with the drainage of the second section, is thrown into the second canal; and so on until the exterior one is reached, and a fall obtained. The polders in the Netherlands are so numerous, that we can only mention a few of the most important. The Beemster, one of the richest districts of North Holland, until 1612 a sheet of water, is crossed at right angles by long shady avenues, and dotted with comfortable farmhouses and fruitful orchards. The Zype, the Schermer, and the Purmer are also fine polders, but the most important is the drained Haarlem Lake (q. v.), the land reclaimed amounting to about 50,000 acres. In connection with the new canal from the North Sea to Amsterdam several extensive tracts have been reclaimed from the IJ and formed into valuable polders, some of which are now bearing heavy crops.

POLE, CARDINAL REGINALD, born in Staffordshire in the year 1500, was the son of Sir Richard Pole, Lord Montacute, by Margaret, Countess of

Salisbury, daughter of the Duke of Clarence, the brother of Edward IV. His early education was received from the Carthusians at Sheen, whence, being liberally provided for by the king his relative, he passed to Magdalen College, Oxford, and having received deacon's orders was advanced to several valuable preferments, through the favour of the king, Henry VIII. For the further prosecution of his studies, he went to the university of Paris, and thence to Padua, where he formed the friendship of a distinguished group of scholars and friends, all of whom subsequently took a leading part in public affairs—Contareni, Bembo, Sadoleto, and others. In 1525, he returned to England, where the highest ecclesiastical dignities awaited his acceptance. But it was about this time that Henry had resolved upon the divorce from his queen Catharine, and P. not only withheld his assistance in carrying out the project, but provoked the undying resentment of the king by his well-known treatise, *De Unitate Ecclesiastica*. His preferments and pension were withdrawn, and preparations were made for his impeachment. This, and probably still more extreme measures, he evaded by withdrawing from England. The king's resentment fell instead upon his elder brother, and upon his aged mother, the Countess of Salisbury. During the rest of Henry's reign, P. remained in exile. The pope, for the maintenance of whose authority, in the cause of the injured Catharine, P. was regarded as a martyr, treated him with distinguished favour, and elevated him to the cardinalate. He was employed in many affairs of the highest importance, being sent as legate, in 1537, to France and the Low Countries, from both which states Henry VIII. in vain demanded his extradition. He also took an active part in the discussions on the Interim; and when the Council of Trent was opened, he was appointed one of the three legate-presidents who acted in the name of the pope, Paul III. (q. v.). On this pontiff's death in 1549, P. was all but elected to succeed. For some time after Paul's death, he resided chiefly in a monastery near Verona, in comparative retirement, until the accession of Mary called him back to active life, as the main instrument of the reconciliation of England with the papacy. On November 24, 1554, P. solemnly entered London as legate and plenipotentiary of the Roman see, possessing in an equal degree the confidence of the queen. In the arduous charge thus intrusted to him, he acquitted himself with much prudence, and, considering the circumstances of the time, with singular moderation. In the religious or politico-religious severities which marked the later history of Mary's reign, it is all but certain that P. had no share. He was created Archbishop of Canterbury, and Chancellor of the universities of Oxford and Cambridge. On the difficult and critical question of the disposal of the church property confiscated in the former reign, P., who saw the necessity of moderation, was for a time at issue with the pope; but his representations were successful in producing a more moderate policy, and the work of reunion appeared to proceed with every prospect of a complete permanent issue, when it was interrupted by the death of the queen in 1558. P. died within less than twenty-four hours afterwards. Besides the treatise *De Unitate*, already mentioned, he is also the author of a book *De Concilio*, and of other treatises on the authority of the Roman pontiff and the Reformation of England, and of very many most important letters, full of interest for the history of the time.

POLEAXE, a weapon consisting of an axe-head mounted on a long pole. There were many varieties of this arm, passing from a great hand-axe to an

axe-headed spear or halbert, several of the longer sorts bearing but little resemblance to an axe. In the navy, a poleaxe or boarding-hatchet is a hatchet with a handle about fifteen inches long, and a sharp point bending downwards at the back opposite the blade. It is used for boarding or resisting boarders.

Poleaxe.

POLECAT, or FITCHET (*Mustela putorius*, or *Putorius fœtidus*), a quadruped of the Weasel family (*Mustelidae*), and commonly referred to the same genus with the weasel, stoat or ermine, &c. It is the largest British species of that genus, the length of the head and body being about a foot and a half, the length of the tail more than five inches, the form stouter than that of the weasel or of the ermine. Its colour is a deep blackish brown; the head, tail, and feet almost black, the under parts yellowish, the ears edged with white, and a whitish space round the muzzle. The hair is of two kinds—a short woolly fur, which is pale yellow, or somewhat tawny; and long shining hairs of a rich black or brownish-black colour, which are most numerous on the darkest parts. The nose is sharp, the ears short and round, the tail pretty equally covered with longish hair. There is a pouch or follicle under the tail, which exudes a yellowish, creamy substance of a very fetid odour; and this odour is particularly strong when the animal is irritated or alarmed. Hence, apparently, its name *Foumart* (*Foul Marten*), which, with various provincial

Polecat (*Mustela putorius*).

modifications, as *Fulimart*, *Thoumart*, &c., is prevalent in most parts of Britain. The origin of the names P. and Fitchet is much more uncertain.

The P. was much more common in Britain in former times than now, and is almost extirpated from some districts, through the constant war waged against it by gamekeepers and others. It eats everything that the gamekeeper wishes to preserve. It is extremely destructive in the poultry-yard, the abundance present there inviting it to drink blood and eat brains, which seem to be its favourite luxuries. The rabbit is followed by the P. into its burrow, and its ravages among poultry are partly compensated by its destruction of rats.—The skin of the skunk is now a popular fur under the name of black marten or Alaska sable. In 1860 the sales in London were 145,679, and in 1870, 55,639, a larger number being retained and sold in America than heretofore, and 100,000 are probably sold annually in the United States. To artists, the hair of the *fitch* or *fitchet* is well known as that of which their best brushes are made; the hairs used for this purpose being the long hairs already noticed,

which grow through the lighter-coloured fur of the animal.—The Ferret (q. v.) is supposed by some to be a mere variety of the polecat.—A dark-coloured kind of ferret is commonly regarded as a cross between the P. and the ferret, and is sometimes called the *Polecat-ferret*. The P. breeds in May or June, making its nest in an old rabbit burrow or similar hole, and producing four, five, or six young.—In North America, the Skunk (q. v.) is called polecat.

POLEMONIA/CEÆ, a natural order of exogenous plants, allied to *Convolvulaceæ*, and containing more than 100 known species, natives of temperate countries, and particularly abundant in the north-western parts of America. They are mostly herbaceous plants, with alternate and often pinnated leaves; regular hermaphrodite flowers; 5-cleft calyx; 5-lobed corolla; 5 stamens, springing from the tube of the corolla; the ovary free, surrounded with a fleshy disc; the style surmounted by a 3-cleft stigma; the fruit a capsule with 3 cells, and 3 valves; the seeds often enveloped in mucus, which contains spiral threads. Some of the species are favourite garden flowers, as *Polemonium ceruleum*, *Cobaea scandens*, and species of *Phlox*, *Ipomopsis*, *Gilia*, &c. None are of value otherwise. *Polemonium ceruleum*, the only British species, and a rare plant in Britain, is well known in gardens by the curious name of *Jacob's Ladder*. It is also called *Greek Valerian*. It is not supposed to be really the *Polemonium* of the ancients, to which great medicinal virtues were ascribed by them. It has a stem from one to two feet high, pinnate leaves, and a panicle of blue (or white) flowers.

POLE'NTA, a preparation of Semolina (q. v.) or of Indian corn or maize meal, which is used as food by all classes in Italy. By the poorer classes, maize is universally used. The material is mixed with milk or water, and boiled until it is just thick enough to pour out into a dish, in which it becomes as firm as a thick jelly. Cheese is grated over it, and other condiments are added according to taste, and it is cut out in slices, and either eaten at once, or sometimes the slices are lightly fried in oil or butter. Semolina being much more expensive, is only used by the wealthier people, and many ingredients are added to suit their tastes.

POLE-STAR, or **POLARIS**, the nearest conspicuous star to the north pole of the celestial equator. The star which at the present time goes under the name of the 'pole-star' is the star α in the constellation of Ursa Minor. By examining attentively the general movement of the stars throughout a clear winter's night, we observe that they describe circles which are largest at the equator, and become smaller and smaller as we approach a certain point (the north pole of the celestial equator), close to which is the star above mentioned. This 'pole-star' is, however, a little less than $1\frac{1}{2}^\circ$ from the pole, and has a small but sensible motion round it. See **POLES**. Owing to the motion of the pole of the celestial equator round that of the ecliptic (see **PRECESSION OF THE EQUINOXES**), this star will in course of time (about 2100 A.D.) approach to within 28' from the north pole, and will then recede from it. At the time of Hipparchus (156 B.C.), it was 12° , and in 1785, $2^\circ 2'$ from the north pole. Its place can easily be found in the heavens, for a line drawn between the stars α and β (called the two *pointers*, from this peculiarity) of the constellation Ursa Major, or the Great Bear, and produced northwards for about $4\frac{1}{2}$ times its own length, will almost touch the pole-star. Two thousand years ago, the star β of Ursa Major was the pole-star; and about 2300 years before the

Christian era, the star α in the constellation of the Dragon was not more than $10'$ from the north pole; while 12,000 years after the present time, the bright star Vega in Lyra will be within 5° of it.

The south pole of the celestial equator is not similarly marked by the near neighbourhood of a bright star, the only star deserving the name of the south pole-star being of the sixth or least visible magnitude.

POLES (Gr. *polos*, a turning-point), in *Geography*, are the two extremities of the axis round which the earth revolves; they are therefore situated the one on the north, and the other on the south side of the equator, and equidistant from all parts of it, or in lat. 90° N. and lat. 90° S. They are called the north and south poles of the earth.—In *Astronomy*, the poles, which, for distinction's sake, are frequently denominated 'celestial poles,' are those points in the heavens to which the earth's axis is directed, and round which the heavens seem to revolve. The celestial poles are valuable points of reference to astronomers and geographers, so that the determination of their position in the heavens is a matter of the utmost importance. Unfortunately, no stars mark their exact situation (see **POLE-STAR**)—though there is a minute telescopic star only a few seconds from the north pole, which may be employed instead of it in rough observations—and therefore it is necessary to adopt some means for discovering its precise position. This is effected in the following manner: A bright star (generally the pole-star) is selected, and its position in its upper and its lower *Culminations* (q. v.) is accurately noted; the point midway between these two positions of the star is the pole of the heavens. The observation of the star's two positions must be corrected for refraction, and it is for this reason that the pole-star is selected, since the effect of refraction is much the same in both positions of the star. The term 'poles' has, however, a wider application, as denoting the extremities of a line passing through the centre of a great circle perpendicular to its plane; thus, we have the poles of the horizon (viz., the zenith and nadir), the poles of the ecliptic, the poles of a meridian; and in the same sense, the terrestrial and celestial poles are spoken of as the poles of the equator and equinoctial respectively.—Pole, in *Geometry*, is used in a very indefinite sense; and in *Physics*, it denotes those points of a body at which its attractive or repulsive energy is concentrated. See **POLARITY**.

POLIA'NTHESES. See **TUBEROSE**.

POLICE (Lat. *politia*, Gr. *politeia*, civil government; from *polis*, a city), are constables or peace-officers appointed in all parts of town and country for the purpose of watching property and detecting crime, and arresting offenders and maintaining public order. Though the word policeman is now, especially in towns, a household word, the legal denomination is that of constable; but he is a paid constable, to distinguish him from unpaid constables and special constables. In each parish in England, the justices of the peace have power to appoint constables to act gratuitously and compulsorily; but the vestry has power to resolve that one or more paid constables shall be appointed, in which case the justices are to make the appointment, and these paid constables supersede the unpaid constables. The salary of these parish constables is paid out of the poor-rates of the parish by the overseers. The justices also appoint a superintendent constable for each petty sessional division, to settle the fees and allowances which are to be paid to the constables for the service of summonses, and for the execution of

warrants incidental to the office of justices of the peace. In all boroughs in England, the corporation is empowered, by the Municipal Corporation Acts, to appoint a watch committee, who appoint a sufficient number of men to act as constables. The treasurer of the borough pays their salaries, wages, and allowances, as well as extraordinary expenses incurred by them. By a recent act applicable to counties, the justices are empowered to establish a sufficient police force for each county, and a chief constable is appointed to govern the whole.

The duties of constables or police-officers are exceedingly multifarious, and they receive printed regulations to guide them in the proper discharge of such duties. They have important duties in reference to the apprehension of offenders, and their powers are necessarily larger than those of private individuals. Wherever a person is seen in the act of committing a felony, it is the duty of every one, not merely of constables, to apprehend him or her without any warrant, for no warrant is needed. Persons found offending in many misdemeanours may also be apprehended by anybody without a warrant; but in other cases, a constable only can make an arrest. In case of a riot, anybody may arrest the rioter. Constables are bound to arrest hawkers trading without a licence; and vagrants who are offending against the Vagrant Acts, such as telling fortunes, loitering about premises, &c. The powers of constables are much greater than those of individuals with reference to crimes after they are committed. Thus, where the constable has not seen the offence committed, but is merely told of the fact, and he has reason to believe it, he is entitled to arrest the party charged without any warrant; he must, however, in such cases act only on reasonable suspicion. He is not justified, for example, in apprehending a person as a receiver of stolen goods on the mere assertion of the principal felon, nor is a constable justified in taking a person into custody for a mere assault without a warrant, unless he himself was present at the time the assault was committed, or reasonably apprehends a renewal of it. If a constable have a reasonable suspicion that a man has committed a felony, he may apprehend him; and so a private individual may do so. The difference between the authority of the constable and the private person in this respect is, that the latter is justified only in case it turn out that a felony was in fact committed; but the constable may justify the arrest and detention whether a felony was committed or not. It is the duty of a constable to raise a hue and cry in search of a felon, and all private individuals are bound to join in it, otherwise they may be indicted and fined. An arrest by a constable is usually made by laying hands on the party, and detaining him; but it is enough for the constable to touch him and say: 'I arrest you, in the Queen's name.' If the party arrested be in a house in hiding, the constable may demand admittance, and if he is refused, may then break open the doors; this is so in all cases where the party has committed treason or felony, or has dangerously wounded another. In cases where the constable is not authorised at common law or by some statute to arrest a party without a warrant, then he must produce a warrant signed by a justice of the peace, and shew it to the party if it is demanded; and if the constable happens not to have the warrant in his pocket at the time, even though it is not asked for, is an illegal arrest. When a party is arrested, it is the duty of the constable to take him without any unreasonable delay before a justice of the peace, and meanwhile lodge him in safe custody. The party arrested must not be treated with harshness beyond what

is necessary for safe custody, and therefore it has been held that a constable has no right to handcuff a person whom he has apprehended on suspicion of felony, unless such person has attempted to escape, or it be necessary to prevent an escape. Nor has a constable in general a right to search a person apprehended, unless the latter conduct himself violently.

The conduct of constables in reference to public-houses is of some importance. It is an offence in publicans and beer-house keepers, and indeed the keepers of all places of public resort, to refuse to admit the constable into such house or place at any time. Thus, in the case of these places being open on Sundays at the times prohibited by statute, the constable, if he suspect that the act is being violated, may demand admittance, and thus satisfy himself as to the fact. It is owing also to this power of a constable to enter at all times, that he is enabled to detect other offences in public-houses, such as harbouring prostitutes and disorderly characters. Constables, when suspecting that a betting-house is kept, must first get a warrant from a justice of the peace, which can be obtained without notice to the parties, and can then break into the house. So as to gaming-houses. While constables have summary power of entering public-houses, still this is not to be abused; and it is a distinct offence in the keepers of all public places where wine, spirits, beer, cider, or any fermented or distilled liquors are sold on the premises, to knowingly harbour, or entertain, or suffer to remain there such constables during the time they are on duty, except when quelling disturbances or restoring order. It is an offence punishable with more than usual severity to assault constables when in the execution of their duty. Though constables are paid in great part by each county and borough, and thus by the public at large, it is often requisite for individuals to require the services of extra constables, in which case such individuals must pay for them at their own expense, as is usual in theatres and large establishments. Of late years, considerable complaint had been made as to constables interfering in the protection of game-preserves and fisheries, it being considered that the owners of those properties ought to bear the extra charge, if required, of the constables' giving more than the ordinary attention to poachers. But by the recent Act, extended powers of detecting poachers of game were given to constables, who are now entitled, whenever they suspect people on the highway of being engaged in poaching, to stop and search them, and then summon the poachers, if necessary, before justices. See POACHING.

In 1872, the total police and constabulary in England and Wales amounted to 27,999 men, of whom 440 were detectives. These are subdivided into—chief constables of counties, 64; head constables of boroughs, 166; superintendents, 506; inspectors, 911; sergeants, 2814; constables, 22,703; additional constables, 395; detective officers, 440. The proportion of policemen to the population is about 1 to 811. In that year the total police expenses amounted to £2,372,880, of which £504,453 was paid out of Her Majesty's treasury, and £79,600 out of the Superannuation Fund; while allowances and contingent expenses amounted to £56,478. It is curious to observe the details of expense caused by this force. For example, its clothing and accoutrements cost the country in 1872, £177,678, while station-house charges, printing, and stationery amounted to £187,372. The public revenue pays nothing towards the city of London police; it pays all the cost of the dockyard police; it pays nearly one-fifth of the other branches of the police.

In Ireland, the first regular police force was estab-

lished in 1814, which was improved in 1836 and 1839. Originally, the expense was defrayed partly out of the Consolidated Fund; but in 1846, the whole expense was borne by the Consolidated Fund, with trifling exceptions. In 1870, the total cost of the constabulary of Ireland amounted to £856,523, which included such items of expenditure as pensions, gratuities, rent of barracks, horses, forage, arms, ammunition, pay, and clothing. The number of constables was 12,714; the strength allowed 13,597.

In Scotland, during the year ending March 1873, the police force for the counties was 1130, and that for the burghs 1899; total 3029. In addition to this number, the Tweed commissioners paid for 23 constables; 9 more are paid by other fishery commissioners, 49 employed by companies or private persons, and 980 by harbour boards.

POLICE, MILITARY, has two significations—1st, the organised body employed within an army to preserve civil order, as distinct from military discipline; and 2d, a civil police with a military organisation. The police of an army commonly consists of steady intelligent soldiers, who act under the orders of the provost-marshal, and arrest all persons out of bounds, civilians not authorised to pass the lines, disorderly soldiers, &c.; they also attend to sanitary arrangements. As in all military matters, the police of an army possess summary powers, and a sentence of the provost-marshal is carried out immediately after it is pronounced.

Of civil police with military organisation may be instanced, as specimens, the Gendarmerie (q. v.) of France, the Sbirri of Italy, and, in an eminent degree, the Irish constabulary.

POLICY (a corruption of the Lat. *polyptycha*, [analogous to *diptycha*, i. e., two-fold, or a pair of tablets] applied in the middle ages to memoranda or registers written on a set of several tablets), as a Legal term, denotes the contract of insurance (Ital. *polizza d'assicurazione*). The usual contracts are for the insurance of life, or rather against the risk of death, against fire, against loss of a ship; but the same name is given to a similar instrument adapted to meet any other risk. See INSURANCE.

POLIGNAC, an ancient French family, which takes its name from a castle said to have been built in the 5th c., on a rock of the Cevennes, near Puy-en-Velay, in the department of Haute-Loire, on the site of a Roman temple dedicated to Apollo, whence—according to certain rather credulous genealogists—the castle was originally called *Apollinique*, of which Polignac is affirmed to be only a later corruption. The first of the Polignacs who acquired celebrity was MELCHIOR DE P., younger son of ARMAND, 16th MARQUIS DE P., and born at Puy-en-Velay, 11th October 1661. Destined by his parents for an ecclesiastical career, he received an excellent education at Paris in the colleges of Clermont and Harcourt. In the negotiations of Cardinal de Bouillon with Pope Alexander VIII. at Rome in 1689, the young, but astute and insinuating abbé took a principal part. In 1695, he was sent to Poland as French ambassador, when John Sobieski was dying; and diplomatized and intrigued so cunningly in favour of Prince de Conti, that the latter was actually elected his successor. Events, however, frustrated this policy, and both Conti and P. had to leave Poland rather precipitately, in consequence of which the latter lost the royal favour. He now retired to his abbey at Bonport, where he spent the next four years, partly occupied in the composition of a Latin poem entitled *Anti-Lucretius*, which was intended as a refutation of the scepticism of Bayle. It appears to be a very respectable and

even able performance. In 1702—after a stroke of his usual neat flattery—he was recalled to Versailles, and rose higher into favour than ever. Named *Auditeur de Rote* in 1706, he was sent to Rome, where he devoted himself to the study of canon and civil law, was associated in the negotiations of Cardinal de la Trémouille, and honoured with the friendship of Pope Clement XI. In 1712, he was appointed French plenipotentiary at the Congress of Utrecht; and after his return, obtained the abbey of Corbie and Anchin. When Louis XIV. died, P. was at the top of his reputation and influence. During the regency of the Duke of Orleans, he took part in the conspiracy of Cellamare, and was banished to his abbey of Anchin. In 1720, he was sent to Rome, charged with the conduct of French affairs, and remained here for about ten years, and signalised his mission by healing the quarrel that was dividing the Gallican Church on the subject of the famous bull *Unigenitus*. In 1726, he was raised, in his absence, to the archbishopric of Auch; and on his return to France, spent the remainder of his days in literary repose, and in the high esteem of courtiers, scholars, and the like. He died 3d April 1742. P. succeeded Bossuet at the Académie Française in 1704, and became an honorary member of the *Académie des Sciences* (1715) and of the *Académie des Belles-lettres* (1717). See C. Faucher's *Histoire du Cardinal de Polignac* (2 vols., Paris, 1772), St Simon's *Memoires*, and D'Argenson's *Memoires*.

The other members of the Polignac family who have an historical name at all are more notorious than noteworthy. In the reign of Louis XVI., TOLANDE-MARTINE, GABRIELLE DE POLASTRON, DUCHESS DE P. (born 1749; died at Vienna, 9th December 1793), and her husband, JULES, DUC DE P. (died at St Petersburg, 1817), were among the worst, but unhappily most favoured advisers of Marie Antoinette. They obtained vast sums of the public money from their royal master and mistress, and were largely, if not mainly responsible for the frightful pecuniary extravagance of the court. The discovery of the famous *Libre Rouge* occasioned the exulting cry of Mirabeau: *Mille Écus à la Famille d'Assas pour avoir sauvé l'État; un Million à la Famille Polignac pour l'avoir perdu!* The Polignacs—knowing the deep hatred felt towards them by the French people—were the first of the noblesse to emigrate (16th July 1789). From the Empress Catharine of Russia, the duke received an estate in the Ukraine, and did not return to France at the Restoration. He left three sons and a daughter, of whom only one has become historical—AUGUSTE JULES ARMAND MARIE, PRINCE DE P. (born at Versailles, 14th May 1780). On the Restoration, he returned to France; became intimate with the Comte d'Artois, afterwards Charles X.; shewed an ardent attachment to the Church of Rome—or at least to its policy—and, in consequence, received from His Holiness, in 1820, the title of Prince; was appointed ambassador at the English court in 1823; and finally, in 1829, became head of the last Bourbon ministry, in which capacity he promulgated the fatal ordinances that called France to arms, and drove Charles X. from the throne. He then attempted to flee from the country, but was captured at Granville on the 15th of August; was tried, and condemned to imprisonment for life in the castle of Ham, but was set at liberty by the amnesty of 29th November 1836. He took up his residence in England, but died at Paris, 2d March 1847.

POLISH LANGUAGE AND LITERATURE. The Polish language is one of the most widely-

spread branches of the Slavic, forming (according to Dobrowsky), along with the Bohemian, the western branch. It surpasses almost all the other Slavonic tongues in euphony and flexibility, and is scarcely excelled by any language in point of brevity. It does not make use of the article, but has a most elaborate declensional system, comprising seven cases. The conjugation of the verb is equally elaborate, and enables a Pole to express transitions and delicate niceties in the conditions of time and gender quite unknown to the French, or German, or English verb. The Polish vocabulary is also uncommonly rich. The number of harsh consonants in the language, it must be admitted, is large, and this fact is a marked distinction between it and its eastern sister, the Russian, but in pronunciation, these are so much softened that its euphony is preserved. It alone of all the Slavic dialects, with exception of the old Slavic Church language, has nasal sounds *g*, like the French *on*; and *g*, like the French *in*. The letter *l* has also a peculiarly broad snarling sound. After the introduction of Christianity, Latin, the language of the church, exercised a powerful influence on its structure and development, and subsequent to the 14th c., it adopted into its vocabulary numerous German words. In the 16th c., Polish, as a written language, rapidly attained so high a degree of perfection that it supplanted even Latin itself, until then the language of the state and of the learned. The best Polish grammars are those of Mrongovius (3d ed., Danz. 1837), Bandtke (Breslau, 1824), and Muczkowski (Crac. 1845); the most comprehensive dictionary is that of Linde, after which rank those of Bandtke (2 vols., Breslau, 1806), Mrongovius (Königsb. 1835) and Trojanski (4 vols., Posen, 1835—1846).

The history of Polish literature is divisible into five clearly marked periods. The first extends from a date antecedent to the introduction of Christianity down to the close of the 15th century. Of pre-Christian Polish literature, nothing has survived but some popular songs and proverbs. Among the very oldest literary monuments is a hymn to the Virgin Mary, ascribed to St Adalbert. The introduction of Christianity paved the way for a Latin literature more or less ecclesiastico-historical. Casimir III. (q.v.), surnamed the Great, did more than any other early Polish monarch for the encouragement of literature, and, among other things, founded the university of Cracow, which, from the beginning of the 15th c., long continued to be the centre of intellectual life and culture in Poland. To the 15th c. belong Jan Długosz (Lat. *Longinus*), author of a most interesting and valuable *Historia Polonie*, in 13 books, and otherwise worthy of remembrance as an able diplomatist and philanthropist; also Jan Łaski, Archbishop of Gnesen (b. 1457, d. 1531), whose collection of the oldest Polish laws, *Commune Inelyta Polonie Regni Privilegium*, is of great historical importance. In 1490, the first printing-press in Poland was established at Cracow.

The second period of Polish literature embraces the 16th and first quarter of the 17th c., and is marked by the use of the Polish as a written language. The reigns of Sigismund I. and Sigismund II. Augustus, are regarded as the golden era of Polish literature, properly so called. The series of poets begins with Nikol. Rej (b. 1515, d. 1568), commonly called the *Father of Polish Poetry*, a native of Zoravno, in 'Little Russia,' and educated at Lemberg and Cracow. He spent his life at the court of the Sigismunds. His principal works, *Wizerunek Żywota Człowieka Poczciwego* (Crac. 1560) and *Apophthegmata* (Crac. 1568), are full of

sharp wit and strong satire, and though the language is rough and unpolished, it is genuinely poetical. After Rej, the brothers Jan and Piotr Kochanowski hold the highest rank. Szymonowicz or Simonides (d. 1629) acquired by his Latin odes the name of the 'Latin Pindar;' and his *Sielanki* ('Idylls,' new ed. Leip. 1837), modelled on those of Theocritus, exhibit a charming simplicity of style. Still more original, if scarcely so graceful, are the *Sielanki* (new ed., Leip. 1836) of his friend Zimorowicz (d. 1629). Sebastian Klonowicz, called *Acernus* (d. 1608), is celebrated as a satirist and descriptive poet. The Reformation, which rapidly made way in Poland, being tacitly approved of by the rulers and magnates, gave a powerful stimulus to the intellectual and spiritual activity of the nation—visible in translations of the Bible, hymn-books, and an important pulpit or sermon literature. Among the historians of this period, the most celebrated are the brothers Bielski; Lukas Górnicki (d. 1591), author of a history of the Polish crown (*Dzieje w Koronie Polskiej*, Crac. 1637, Wars. 1804); Strzikowski (d. 1582), whose *Chronicle of Lithuania* (Königsb. 1582) is an admirable work; and Paprocki (d. 1614).

The third period of Polish literature, extending from 1620 to 1750, is coincident with the rule of the Jesuits, who first obtained a footing in Poland about 1566, through the influence of Cardinal Hosius, soon possessed themselves of the schools, and, on the whole, seriously checked the literary and religious growth of the nation. The most conspicuous poet of this retrogressive period is the Jesuit Kazimierz Sarbievski (1595—1640), who wrote only in Latin; others more or less noteworthy are Kochowski (died about 1700); Twardowski (d. about 1660); Opalinski (d. 1655); Chros'cinski, the translator of Lucan; Morsztyn, the translator of Corneille; and Elz'sbieta Druz'backa (d. 1760). Among the historians of this period, it may suffice to mention Starovolski (d. 1656), author of *Polonia, sive Status Regni Polonie Descriptio* (Wolfenbüttel, 1656), and other works; Kojalowicz, a Jesuit (d. 1677), and Kaspar Niesiecki, a Jesuit (d. 1745), whose *Korona Polska* (4 vols., Lemb. 1728—1743) is the most important work on Polish heraldry.

The fourth period, commencing with the middle of the 18th c., and extending into the first quarter of the 19th, owes its characteristics partly to the influence of the French literature of Louis XIV.'s time; partly also to the liberal patronage of literature and science by King Stanislas Augustus, the princes Czartoryski, Jablonowski, and other magnates, and the educational reforms of Stanislas Konarski (b. 1700, d. 1773). The good work begun by Konarski was carried on by Kopezyn'ski (1735—1817), who was the first to thoroughly establish on a scientific basis the grammar of the Polish language in his *Grammatyka Norodowa*; by Piramowicz (d. 1801); by Bohomolec, the Jesuit, who translated a multitude of stage-pieces from the French; but above all, by Adam Stanislas Naruszewicz, the accomplished translator of Tacitus; and Ignacy Krasicki (1735—1801), called the 'Polish Voltaire,' the centre of the whole Polish literature of his age, whose satires and fables are reckoned the first in his native language. As poets of this Renaissance period, occur the names of Trembecki; Cajetan Wegierski, Godebski, and Wezik. The most noted dramatist is Boguslavski (d. 1829), who wrote about 80 plays—the majority of which, under the title of *Dziela Dramatyczne*, were published at Warsaw (9 vols., 1820).

The political storms that swept over Europe at the close of the 18th and the first years of the 19th c., did not quite destroy the new literary life that had burst into blossom under Stanislas Augustus.

In 1801, the historian Tadeusz Czacki, Franciszek Dmochowski, and Bishop Jan Albertrandy founded at Warsaw the 'Society of the Friends of Knowledge,' which, especially under the auspices of the state-councillor Staszyc, bore good fruit till it was dissolved in 1832, when its library of 50,000 vols. was carried off to St Petersburg. At the same time, Jozef Maximilian Ossolinski, Hugo Kolontaj, and Stanislas Potocki, by word and writing exercised a mighty influence on the renovation of the national spirit. The transition to this newest or fifth period was made by Karpinski (1745—1825), whose *Songs and Idylls* (4 vols., Warsaw, 1804; new ed., Leip. 1836) live on the lips of the Polish people; by Chancellor Voronicz (1757—1829), a richly imaginative poet, and a great orator; by Niemcewicz (1757—1841), a statesman, soldier, and author of celebrity in his own land; and by the poet Kasimierz Brodzinski (1791—1835). At Wilna, which, after 1815, became the centre of Polish literary activity, and a rallying-point for all the enthusiastic spirits of the land, several young men united, with Adam Mickiewicz (b. 1798) at their head, in a crusade against the still dominant French style of literature. We can only name some of his numerous and brilliant associates, as Malczewski (1792—1826), whose best production is his epic-lyric narrative of Ukraine life, entitled *Marja*; Goszczynski (b. 1806; Poems, 3d ed., Breslau, 1852); Bohdan Zaleski (b. 1802; *Poezye*, Pos. 1841, and later); Tomasz Padura (*Pienia*, Lemb. 1842); Odyniec (*Poezye*, Pos. 1833); Korsak (*Poezye*, Pos. 1833); Chodzko (*Poezye*, Petersb. 1829); Groza (*Poezye*, Wilna, 1836); Lucyan Sieminski (b. 1809), an excellent novelist and translator; Bielowski (b. 1806), a lyric poet and translator; Gorecki, renowned for his pungently sarcastic fables (*Bajki i Poezye nowe*, appeared at Paris in 1833); Garczynski (*Poezye*, Paris, 1833); and Slowacki, the most fertile of all the recent Polish poets. Most of these writers are either 'banished men,' or men who are, or, while living, were, forced to expatriate themselves. They belong to the 'Polish Emigration,' whose head-quarters is Paris. The most many-sided and prolific of all the modern Polish novelists, is Jozef Ignacy Kraszewski (b. 1812), who lives in Volhynia. The new national tendency of Polish literature, which naturally first shewed itself in poetry, soon became visible in other departments also. Thus, Joachim Lelewel (b. 1786) has risen to the first rank as a writer of Polish history, and a study of his works is absolutely indispensable to a knowledge of that subject; next to him (and later) in the same department stand Bandtke, Maciejowski, Count Raczynski, and Count Plater. Narbutt of Wilna wrote a very solid and comprehensive work on Lithuanian History (Wilna, 1837 *et seq.*), and Lukaszewicz of Posen has furnished numerous important contributions to the history of the Reformation in Poland. A multitude of works more or less weighty have been devoted to a record of the revolution of 1830, chiefly, of course, by Polish emigrants. In philosophy, theology, and physical sciences, Poland has nothing of consequence to shew.—The principal works on Polish literature are those of Muczkowski, Bentkowski, Ossolinski, Chodynicky, and particularly the comprehensive *Historya Literatury Polskiej* (Crac. 1840, *et seq.*) of Wiszniewski.

POLISHING MATERIALS. See DIAMOND-GRINDING, EMERY, PASTES, and PUTTY POWDER.

POLISHING OF METALS. This is effected by first removing any tarnish or oxidation by means of some material which will chemically act upon it; for this purpose, sulphuric, hydrochloric, oxalic, and acetic acids are used to different metals, and in

various states of dilution. Usually, it is necessary to remove the acid with clean water, and dry rapidly, to prevent re-oxidation; and then either friction with various polishing materials, or rubbing with a smooth hard surface or burnisher, brings out the lustre of the metal.

POLISHING OF STONE. See **STONE**.

POLISHING SLATE, a mineral composed chiefly of silica, with a little alumina, lime, oxide of iron, and water; white, yellowish-white, or yellow; of a slaty texture, opaque, very brittle, and of specific gravity not much more than half that of water; so that it swims in water till its pores become filled with the liquid. It is found in Bohemia, Saxony, and Auvergne, and has been supposed to be a volcanic product, but it consists of silicious remains of *Diatomaceæ*. It is used for polishing glass, marble, and metals.

POLITICAL ECONOMY. The word economy is derived from the Greek for house-law or house-regulation. It refers to the material portion of domestic regulation, and does not, for instance, embrace the observance of religion or the communication of instruction. The most important part of it is the adjustment of the expenditure of the household to the income at their command. Hence the word economy is sometimes applied, both in a public and a private sense, to the saving of money. The term 'Political' came to be used along with it as a convenient method of expressing the application to a state of a sound system of management in relation to its affairs. In later times, however, the word, as applied to a community, has been assumed to be different from its application to a household. It was thought that one could regulate a people, just as a house is regulated, by adjusting the spending and the getting of the national wealth. Hence arose several doctrines—such, for instance, as 'the balance of trade,' which taught that the trade with any nation is only profitable when you sell more to that nation than you buy from it; the system of bounties upon special trades, as being more profitable to others; and lastly, the system of protection to native industry—the true policy of a nation that would develop its resources and elevate its people. Political economy now means, not the art of regulating communities in this respect, but the science of those laws which Providence has established for their regulation, and it has hence been assumed that the analogy with domestic economy ceases. Domestic economy is the regulation of a household—not the leaving of it to follow its own dictates; and, indeed, that there is a disposition, more or less, in the head of every house, to limit its expenditure to its income, is one of the phenomena by which things right themselves, as it were, and make up those laws of nature which constitute political economy. A man knows that if he buys too much, he will become bankrupt; and should the wholesale merchant buy too much from this or that country, so as to place the balance of trade against us, we would be the losers unless our own produce could pay for what we bring in. This truth has been frequently illustrated in the United States, the export of gold having repeatedly brought bankruptcy to America. The income and expenditure of the government, as apart from that of the people of the community, are of course under regulation like those of a household; and are most appropriately considered under Finance (q. v.). There are a few people who still hold that there is no natural system sufficient in itself to regulate the material affairs of mankind; and that these should be committed to the hands of special managers. Finding the approved doctrines of political economy going further and further from

their direction, such persons, though few in number, have been very absolute in their views, and zealous in pushing them. One class of these are called Socialists; and another, who go further lengths, are called Communists. It has not been considered necessary here to go beyond the mere description or definition of the nature of political economy, because the various parts of which it consists are given each under its own head, as BOUNTY, CAPITAL, COLONY, COMMUNISM, COMPETITION, CORN LAWS, DEMAND AND SUPPLY, EXCHANGE, FREE TRADE, LABOUR, MONOPOLY, NAVIGATION LAWS, RENT, VALUE, &c.

POLITICAL OFFENCES, crimes considered injurious to the safety of the state, or such crimes as involve a violation of the allegiance due by a subject to the supreme authority of the state.

By the Roman law, in the early times of the republic, every act injurious to the state was comprehended under the name *perduellio*, and visited with death. That term included conspiracy against the government, aiming at kingly power, aiding the enemies of Rome, and losing an army. The word *perduellio* afterwards fell into gradual disuse, and the chief state offences were known by the term *majestas* or *crimen læsæ majestatis*, somewhat akin to the treason of modern times. In the republican period, the crimes to which the epithet *læsæ majestatis* was most frequently applied, were the betrayal or surrender of an army to the enemy, the excitement of sedition, and such a course of administration as impaired the dignity of the state. In imperial times, acts and words disrespectful to the reigning emperor were included, and an indignity to his statue was visited nearly as severely as an offence against his person. *Læsæ majestatis* was generally punished with death, confiscation, and infamy. The criminal might even be tried after his death, to the effect of confiscating his property, and rendering his memory infamous—a practice which has been resorted to both in France and Scotland as late as the beginning of the 16th century.

In modern times, the acts brought under the category of political offences have varied much at different periods and in different countries. They have in general been more leniently dealt with under constitutional than under despotic governments. It is, however, a principle which has been generally recognised by the most constitutional of governments, that when the legislature thinks itself endangered by a secret conspiracy against the state, or an understanding with the enemies of the country, it permits the executive, for a limited time, to arrest suspected citizens, without the formalities which are required in ordinary circumstances.

In England, a large number of the graver political crimes are included under the denomination of Treason, and the treason law has sometimes been stretched so as to include offences which, by a fair construction, could hardly come within it, such as the use of violence to reform religion or the laws, or to remove the councillors of the sovereign. Even riotous assemblies with the object of destroying all property of a particular class have been held treason. Political offences also include a number of crimes against government falling short of treason, and passing under the name of Sedition, which, though they have for their ultimate object the violation of the public peace, do not aim at direct and open violence against the laws or the sovereign, but rather the dissemination of a turbulent spirit tending to produce such violence. The British government does not permit the political offenders of other countries to be included in extradition treaties; and in modern times, generally speaking, extradition does not apply to political offenders; contrary to the doctrine laid down by Grotius. In

some countries, conspiracy against the sovereign of any country in league with the state is a special offence; in Great Britain, however, this seems not to be the case. A bill introduced in 1858 to make it felony to conspire to commit a murder without as well as within her Majesty's dominions, was rejected by the House of Commons on the second reading, from the idea that it was dictated by France.

POLITICS (Gr. *pólis*, city or state), that branch of ethics which has for its subject the proper mode of governing a state, so as to secure its prosperity, peace, and safety, and to attain, as perfectly as possible, the ends of civil society. Among the subjects which political science embraces are the principles on which government is founded, the hands in which the supreme power may be most advantageously placed, the duties and obligation of the governing and governed portions of society, the development and increase of the resources of the state, the protection of the rights and liberties of the citizens, the preservation of their morals, and the defence of the independence of the state against foreign control or conquest. While the philosophy of governing constitutes the *science* of politics, the *art* of politics consists in the application of that science to the individual circumstances of particular states. The ancient Greek writers treated politics with reference to an ideal perfect state, which each propounded according to his own speculative views, pointing out the variation of every existing government from his standard. The politics of a country, in common parlance, implies the course of its government, more especially in its relations with foreign powers.

POLIZIANO, ANGELO, whose name is perhaps better known under the Latin form of **POLITIANUS**, was the son of a doctor of civil law, and was born at Montepulciano in Tuscany, 14th July 1454. The family name was Ambrogini, but P. took his from his native town—in Latin, *Mons Politianus*. He studied Latin at Florence under Cristoforo Landia, Greek under Andronicus of Thessalonica, the Platonic philosophy under Marsilio Ficino, and the Aristotelian under Argyropoulos. He also devoted some attention to Hebrew. P.'s talent for poetry was early developed. When scarcely fifteen years of age, he took the Florentines with surprise by the publication of his famous *Stanze* (a poem of 1400 lines) in honour of Giulio de Medici, who had carried off the palm at a tournament. Lorenzo de Medici took notice of the brilliant lad, and at once placed him in a condition to continue his studies without any pecuniary harassments, by appointing him tutor to his two sons, and subsequently gave him a residence in his charming villa near Fiesole, where P., who was passionately fond of country life, resumed his studies with fresh ardour. In 1484, he accompanied the Florentine ambassadors to Rome, and was received in a flattering manner by the pope, at whose request he translated (into Latin) the Greek historian Herodotus, for which he received 200 golden crowns. He also made Latin versions of the *Enchiridion* of Epictetus, the *Charmides* of Plato, and other works, with such elegance, that Erasmus pronounced him a master in translation. After having filled for some years a chair of Latin literature, he commenced the teaching of Greek. His popularity as a professor was great. Pupils came to study under him from all the great cities of Italy, and even from distant parts of Europe; the principal were Francesco Pucci, Fortiguerra, Maffei de Volaterra, P. Crinitus, Guillaume Grocyn, Thomas Linacre, and Michael Angelo. His copies of Ovid, Statius, Pliny the

Younger, Quintilian, &c., and other authors, are still preserved in the different libraries of Italy, and are covered with marginal notes. His copy of the famous *Digest* of Roman law, with an elaborate philological and grammatical commentary, is still preserved in the Laurentian Library at Florence. In 1489 appeared his *Miscellanea*, a collection of critical and other observations on the ancient authors. Towards the close of his life, he entered into orders, and was made canon of the cathedral of Florence. He died 24th September 1494. Among the brilliant scholars of the classical Renaissance, P. occupies a foremost place in virtue of his vigour and originality. His intellect was indeed penetrated by an admiration of the chaste and noble literature of antiquity; but there was nothing servile in his imitations; he reproduced without difficulty—because he was himself a kindred genius—the strength of Tacitus, the elegance of Livy, and the conciseness of Sallust; his Latin poems, especially his elegies, display the beauty and ardour of his imagination. Among his vernacular pieces may be mentioned his *Canti Carnascialeschi* (Carnival or Merry Ballads), remarkable for their felicity of style, sweetness of pathos, and abundance of imagery. Another proof of his varied poetical power was his *Orfeo*, one of the earliest dramatic compositions produced in Italy. The editions of P.'s separate writings have been numberless. See Seraszi's *Vita di A. Politiano*; N. A. Bonaifous *De A. Politiani Vita et Operibus* (Paris, 1845), Tiraboschi's *Storia della Letterat. Italiana*; Gresswell's *Memoirs of Politiano*, and Roscoe's *Lives of Lorenzo de Medici and of Leo X.*

POLK, JAMES KNOX, eleventh President of the U.S. of America, was born in Mecklenburg County, North Carolina, November 2, 1795. His ancestors, who bore the name of Pollock, emigrated from the north of Ireland early in the 18th century. Though his father was a farmer in moderate circumstances, he was educated in the university of North Carolina, and studied law with Felix Grundy of Tennessee, an eminent lawyer and statesman. Admitted to the bar in 1820, he was three years after elected a member of the legislature of Tennessee, and soon after, to the Federal Congress, by the Democratic party. In 1836, he was chosen Speaker of the House of Representatives, a position he filled during five sessions with firmness and ability. After serving fourteen years in Congress, he was, in 1839, elected governor of Tennessee; and in 1844 unexpectedly nominated, as a compromise candidate, for the presidency, against Henry Clay, and elected. During his term, the Oregon boundary was settled by a compromise offered by England, though the party cry which helped to elect him was a claim for the entire territory to 54° 40' N. lat. The annexation of Texas caused, in 1846, a war with Mexico: 50,000 volunteers, added to the small regular force, sufficed to take the capital (September 14, 1847), and enabled the government to dictate terms of peace, by which it acquired California and New Mexico. Having pledged himself to a single term of office, Mr P. refused a re-nomination, and retired to his home in Nashville, Tennessee, where he died three months afterwards, June 15, 1849. Mr P. was a man of respectable abilities, and of a solid, firm, honest, and religious character. He was devoted to the principles of the Democratic party of Jefferson and Jackson—state rights, a revenue tariff, independent treasury, and strict construction of the constitution.

POLKA, a species of dance, of Polish or Hungarian origin, the music to which is in $\frac{3}{4}$ time, and has the rhythmical peculiarity of being accented on the third quaver of the measure. It was

introduced as a fashionable dance into Western Europe about 1841.

POLL-ACT, a sanguinary act, passed at Trim in Ireland, by the Junte of the Pale, in 1465, under the Earl of Desmond, deputy. It ordained 'that it shall be lawful to all manner of men that find any theeves robbing by day or night, or going or coming to rob or steal, or any persons going or coming, having no faithful man of good name and fame in their company in English apparell, that it shall be lawfull to take and kill those, and to cut off their heads, without any impeachment of our sovereign lord the king. And of any head so cut off in the county of Meath, that the cutter and his ayders there to him cause the saed head so cut off to be brought to the portreffe to put it upon a stake or spear, upon the Castle of Trim, and that the saed portreffe shall testify the bringing of the same to him. And that it shall be lawful for the saed bringer of the saed head to distrain and levy by his hand (as his reward) of every man having one ploughland in the barony, two pence; and of every man having half a ploughland, one penny; and of every man having an house and goods, value forty shillings, one penny; and of every cottier having one house and smoak, one half-penny.' Much slaughter is said to have been committed under this remarkable act.

POLL-TAX. See **CAPITATION**.

POLLACK (*Merlangus pollachius*), a fish of the family *Gadidae*, of the same genus with the Whiting and Coal-fish. It is common on the coasts of all parts of Britain; and in Scotland and some parts of Ireland, it is called *Lythe*. It is a very playful fish, often gamboling on the surface of the water. It attains about the same size as the coal-fish. It has three dorsal fins; the body is of a longish shape; the lower jaw is much longer than the upper; the tail is slightly forked. The flesh is reckoned superior to that of the coal-fish. Young pollocks are sometimes sold as whittings, to which, however, they are not nearly equal. No fish more readily rises to the artificial fly, and in this way great numbers are caught on the British coasts. The fly is merely a bit of white feather tied to a common bait-hook. Worsted is sometimes used instead of the feather; and flies of different colours are sometimes used together, with great success. No reel is employed, and any stick is good enough for a rod; a few yards of string make a sufficient line.

POLLAN (*Coregonus Pollan*; see **COREGONUS**), a fresh-water fish of the family *Salmonidae*, a native of lakes in Ireland. It is particularly abundant in Lough Neagh, where it is often seen in large shoals, which issue from the deep waters, and haunt the shore from spring to autumn, when great numbers are taken by nets, and sold in the neighbouring country. The P. is from 10 to 12 inches in length; it resembles the Gwyniad, but has not the snout produced like that fish; and there are differences in the size and position of the fins. It is very like *Coregonus sikus*, a species found in the most northern parts of Norway. The spawn of the P. is deposited in November and December on the rocky or stony parts of the bottom of the lake which it inhabits. It is a well-flavoured fish. The cry of 'Fresh Pollan' is even more common in Belfast during summer than that of 'Fresh Herring.'

POLLARDING (to *poll*, to cut off, or shave the head) is the cutting off of the whole crown of a tree, leaving it to send out new branches from the top of the stem. Trees thus treated are called *pollards*. The new branches are never equal in magnitude to the original branches of the tree, although often more numerous, and when pollarding

is often repeated, the scars and stumps form a thick ring at the top of the stem, from which many small branches spring. Pollards are not beautiful; but pollarding is practised with advantage in districts where fuel is scarce, the branches being cut off in order to be used for fuel, and the operation repeated

Pollard Oak.

every third or fourth year. It is much more prevalent in many parts of Europe than in any part of Britain, and in Britain is almost confined to those districts of England which are furthest from coal. Willows, Poplars, Alders, Elms, Oaks, and Limes are the trees most frequently pollarded, and in some parts of Europe the White Mulberry. The trees of most rapid growth are preferred where fuel is the object; and willows, poplars, and alders are planted along water-courses, and in rows in moist meadows and bogs. Oaks are sometimes pollarded chiefly for the sake of the bark of their branches, and the whole treatment very much resembles that of copse-wood. In some parts of Germany, landscapes may be seen of open country with many scattered oak and elm pollards, presenting a very peculiar appearance.

POLLEN. See **STAMEN** and **FECDUNDATION**.

POLLENZA, a well-built town in the northern part of the island of Majorca, about 2 miles west of the Bay of Pollenza, and 28 north-west of Palma. It has a Jesuits' college and some manufactures of black woollen cloth. Pop. about 6500.

POLLIO, C. ASINUS, a politician, soldier, and author of considerable merit, and still more considerable reputation, was born in Rome 76 B. C., but belonged to a family of Marrucinian descent. His first ambition was to be an orator, and in his youth he seized every opportunity of hearing such men as Hortensius and Cicero. When civil war broke out between Cæsar and Pompey, P. sided with the former, was present at the crossing of the Rubicon, and accompanied the great general in his rapid triumphal march through Italy. He joined Cæsar in his expedition to Greece against Pompey, and took part in the decisive battle of Pharsalia, 48 B. C. At the time of Cæsar's assassination (15th March, 44 B. C.), P. was governor of Hispania Ulterior (Further Spain), and carrying on the war against Sextus Pompey. In the subsequent struggles, he

sided with the triumvirate (Antony, Lepidus, and Octavian) against the oligarchic senate; and on the triumph of the former, was appointed administrator of Transpadane Gaul, in which capacity he saved the property of the poet Virgil at Mantua from confiscation. After Antony and Octavian had quarrelled, it was P. who effected their temporary reconciliation at Brundisium, 40 B. C.; next year he conducted a successful campaign against the Parthini, a people of Illyria, and in consequence, obtained a triumph. After this event, however, he withdrew altogether from political life. He lived 18 years after the Emperor Augustus, dying at his Tusculan villa, 4 A. D., in the 80th year of his age. Besides having a reputation for oratory, P. was celebrated as a historian, poet, and critic; and there seems little reason to doubt that he was an author the loss of whose writings is to be regretted. His literary and political criticism of his contemporaries, in particular, appears to have been valuable. He also claims remembrance as a distinguished patron of men of letters, such as Catullus, Horace, Virgil, and as the founder of the first public library at Rome.

POLLNITZ, KARL LUDWIG VON, noted as a writer of memoirs of his time, was born near Cologne in 1692. He was equally remarkable for his talents and want of principle; and while his father's position as minister of state to the Elector of Brandenburg gave him access to court-circles, his extravagance and eccentricity, coupled with his vagabond habits, often reduced him to the greatest poverty. But after wandering all over Europe, taking service in the church in Austria, and in the army in Spain, he finally attracted the favourable notice of Frederick the Great, who appointed him his reader, and made him director of the theatre at Berlin. After having twice changed from Catholicism to Calvinism, he proclaimed himself a member of the church of Rome shortly before his death, which occurred in 1775. Among the numerous memoirs, either written by or ascribed to him, the following were the most popular in their day, and the most applauded for the powers of observation and the wit which they exhibit: *Lettres et Mém., et la Relation de ses premiers Voyages* (Amst. 1735); *Etat abrégé de Saxe sous Auguste III.* (Frankf. 1734); *Hist. secrète de la Duchesse d'Hanovre, épouse de George I.* (Lond. 1732). After his death, Brunn brought out P.'s *Mémoires pour servir à l'Histoire des quatre derniers Souverains de la Maison de Brandebourg* (2 tomes, Berl. 1792).

POLLOCKSHAW'S, a municipal borough in the county of Renfrew, Scotland, is situated on the banks of the White Cart, about 2½ miles south-west of Glasgow. The name is derived from the estate of Nether-Pollock, on which the town stands, and from the Scotch word 'shaw,' which means a 'grove' or 'plantation.' P. is entirely a manufacturing town; cotton-spinning, calico-printing, silk-weaving, bleaching, and fancy dyeing, are, or until recently, were extensively carried on. Pop. 7648.

POLLOK, ROBERT, a Scottish poet, was born in 1799 at Muirhouse, in the parish of Eaglesham, in the county of Renfrew. After receiving the ordinary course of instruction in country schools, he was sent to the university of Glasgow, and on the completion of his curriculum in arts, he entered the Divinity Hall of the Secession Church, where he studied five years. In 1827, he was licensed to preach. By this time he had written the *Course of Time*, and its composition, together with the ardour with which he pursued his studies, brought on consumption. The poem was published by Mr Blackwood in the same year in which the author

received licence. It was highly praised, but the voice of praise fell on a dying ear. In his critical state, his medical attendants recommended residence for a time in Italy, and in compliance with their advice, he set out, accompanied by his sister. On his arrival in London, his symptoms became suddenly worse, and unable to prosecute his journey, he went to reside at Shirley Common, near Southampton, where he died on the 17th September 1827. He was interred in the churchyard at Millbrook, and over his grave an obelisk has been erected.

The *Course of Time* has run through more than twenty editions, and is extremely popular in Scotland. It is a work of genius, but curiously unequal in merit. It contains eloquent and spirited passages, but considerable portions of it read like a dull sermon turned into blank verse. The writer drew his inspiration from nature, from Milton, and the Shorter Catechism—from the last, perhaps, most of all. His Memoir, written by a brother, was published in 1843. P. also wrote *Tales of the Covenanters*, which were published anonymously.

POLO, MARCO, the celebrated traveller, was born of a noble family of Dalmatian origin, at Venice, about 1250. His father, Nicolo Polo, and his uncle, Matteo Polo, both eminent merchants, had, previous to his birth, set out on a mercantile expedition, visiting Constantinople, Soldaya or Sondach (on the Euxine), and Bulgar (on the Volga), the capital of Barkai, the Khan of Keptchak. Thence they travelled round the north side of the Caspian Sea to Bokhara, where they remained three years, studying the Mongol language and trading; but in 1261, some ambassadors from the Perso-Mogul khan to Kúblai (q.v.), the Grand Khan of the Mongols, happening to pass through Bokhara, the brothers Polo resolved to accompany them to Kementu, the summer residence of the Khagan. They were well received by Kúblai, who was very inquisitive concerning the peoples and mode of government in Europe, and commissioned them to act as his envoys to the pope, bearing a written request for 100 Europeans, well learned in the sciences and arts, to act as instructors to the Mongols. They reached Venice in 1269; but finding it impossible to discharge the mission with which they had been intrusted, they set out on their return in 1271, taking with them young Marco, and arrived again at the court of Kúblai Khan in 1275. Their second reception was still more honourable than the first, and the Khagan took special notice of Marco, from the rapidity with which he learned the customs and language of the Mongols. His wisdom and the nobility of his demeanour also recommended him as a fit envoy to the various neighbouring rulers; and during his residence at their several courts, P. was in the habit of closely observing the manners and customs of the country, and delivering on his return a detailed report to the Khagan. These reports were the groundwork of the book which informs us regarding the state of Central and Eastern Asia in the end of the 13th century. P.'s first mission was to the court of Annam or Tonquin (1277), and during his residence there, he acquired much information, both from his own observation and from report, concerning Tibet, Yunnan, Bengal, Mien (or Pegu), and the south of China; he was next employed to aid in making an inventory of the archives belonging to the court of the Song dynasty; and soon afterwards was appointed governor of the town of Yang-tchow, in the province of Kiang-si, in Eastern China, a post he held for three years. He also accompanied a Mongol army to the attack of the kingdom of Pegu; and closed the list of services rendered to Kúblai by accepting the embassy to Tsiampa, the south

part of Cochín-China. Having thus passed 17 years in the service of the Mongol khan, and visited the chief countries and cities of Eastern Asia, travelling through kingdoms (as China) which no European had ever seen before, and acquiring much knowledge of other kingdoms (as Japan, called by P. *Zipangu*), the existence of which was not even suspected, he succeeded in obtaining permission to join the escort of a Mongol princess, who was travelling to the court of Persia. The three Polos accordingly set out in 1291, travelling through China, and thence, by sailing through the Chinese Sea and Indian Ocean, finally arrived at Teheran, where they stayed for some time; but learning that Kublai Khan was now dead, they continued their journey, and arrived at Venice in 1295, bringing with them much wealth and many precious objects, the fruits of their trading. Marco, in the following year, fought his own galley in the great battle off Curzola, in which the Venetians, under Dandolo, were defeated by the Genoese under Doria, and was taken prisoner and immured in a dungeon at Genoa. Here he dictated, with the aid of the memoranda he had made during his travels, an account of his journey through the East, which was subsequently revised with care. After his liberation he returned to Venice, where he was appointed member of the Grand Council, and died in 1323, eleven years after his father. His work is variously entitled, but the best edition is *Il Milione di Messer Marco Polo Veneziano*, edited by Count Baldelli (Florence, 4 vols. 4to, 1827), and accompanied with a map, notes, and illustrations. P.'s narrative created an immense sensation among the learned public, and many did not hesitate to affirm that it was a pure fiction; but the Catholic missionaries and subsequent Venetian travellers into these remote regions, verified many of P.'s statements, and then came a reaction of public opinion; P.'s wonderful minuteness, extensive research, and accuracy, being the theme of universal admiration. His work was of inestimable value as a stimulant and guide in geographical research; it encouraged the Portuguese to find the way to Hindustan round the Cape of Good Hope; and it roused the passion for discovery in the breast of Columbus, thus leading to the two greatest of modern geographical discoveries. The first edition of P.'s '*Voyages*' was published by Ramusio in his *Raccolta di Navigazioni e Viaggi* (Venice, 3 vols. fol. 1550—1559), and two English translations have been lately published, the one in Edinburgh (1844), and the other in London (1854). There is also a German one by Burck, with notes by Neumann (Leips. 1846).

POLO'TSK, a town of West Russia, in the government of Witebsk, and 60 miles west-north-west of the city of that name, on the banks of the Duna, where that river is joined by the Polota. It is one of the most ancient towns in Russia, having been founded in the 9th century. It is the seat of an archbishop of the Greek United Church, has a Kremlin, a district-school for the sons of nobles, several Greek and Roman Catholic churches. The town possesses a harbour, and has 12,069 inhabitants. Tanning is the only branch of trade carried on to any great extent. Under its walls, in the campaign of 1812, the Russian general, Wittgenstein, defeated the French under Oudinot and Sire.

POLTA'VA, chief town of the government of the same name, is situated on the right bank of the Worskla, a tributary of the Dnieper, in lat. 49° 35' N., and long. 34° 34' E., about 934 miles south-east of St Petersburg. Pop. 31,542 P. has few manufactures, and its trade displays activity only during the annual fairs, of which there are

four. The most important is called the Illinsky, which lasts from the 1st of July to the 1st of August. At these fairs, merchandise is exposed for sale worth £4,000,000. The principal articles of traffic are cloths, woollen tissues, colonial productions, fur, wool, horses, and agricultural produce and implements. P. was founded in 1608, and is historically famous as the scene of Charles XII.'s defeat by Peter the Great in 1709. A monument in the town square commemorates the victory of the czar; and at the distance of three miles from the town is the tomb of the fallen warriors, over which Peter erected a wooden cross, and which is still known as the 'Swedish Tomb.'

POLTAVA, a government of Little Russia, between the governments of Kiev on the west, and Kharkov on the east. Area, 19,150 square miles; pop. 2,002,118. The surface is flat, with a gradual slope south-west to the banks of the Dnieper, which forms the southern boundary, and into which the chief rivers—the Sula, Psiol, and Worskla—flow. The government does not abound in wood, but possesses rich and extensive pastures. The soil is for the most part clay and fertile vegetable mould, and the climate is healthy. Agriculture and cattle-breeding are the staple occupations. Oxen are made use of in all field operations. The various manufactories, chiefly brandy-distilleries, tan-yards, and sugar and cloth manufactories, were (in 1859) only 575 in number, and gave employment to no more than 15,782 hands. Numbers of the inhabitants leave this for other governments, especially those of New Russia, in search of employment; and many of the peasantry are employed with their oxen in bringing salt from the lakes of the Crimea, and fish from the Don. Commerce, which is not carried on on a great scale, is chiefly in the hands of Jews. The fairs, of which 408 take place during the year, are the seasons of the greatest commercial activity. The most important fairs are those of Poltava and Romny.

POLYA'NDRY, or **POLYANDRIA**, that form of polygamy which permits a woman to have several husbands. See **MARRIAGE**. The hot-bed of polyandry is Tibet. There a wife commonly is the wife of a whole family of brothers—the elder brother being chief husband. In the Himalayan and sub-Himalayan regions adjoining and under the influence of Tibet, it is of frequent occurrence in the same form, as in the valley of Kashmir, in Ladak, among the Koech, among the Telingese. Further south in India, we find polyandry among the Todas of the Nilgherry Hills, the Coorgs of Mysore, and the Nayars of Malabar. We find it again off the Indian coast in Ceylon; and going eastward, strike on it as an ancient though now almost superseded custom in New Zealand, and in one or two of the Pacific islands. Going northward, we meet it again in the Aleutian Islands; and taking the continent to the west and north of the Aleutians, it is found among the Koryaks, to the north of the Okhotsk Sea. Crossing the Russian empire to the west side, we meet it among the Saporogian Cossacks; and thus have traced it at points half round the globe. This is not all, however. It is found in several parts of Africa; and it occurs again in many parts of America among the red men. We have the authority of Humboldt for its prevalence among the tribes on the Orinoco, and in the same form as in Tibet. 'Among the Avaroes and the Maypures,' he says, 'brothers have often but one wife.' Humboldt also vouches for its former prevalence in Lan- cerota, one of the Canary Island. Thus, polyandry is a phenomenon of human life independent

of race and country.—See Latham's *Descriptive Ethnology* (1859), vol. i. pp. 24, 28; vol. ii. pp. 398, 406, and 462; Humboldt's *Personal Narrative*, William's translation, 1819, vol. v. part 2, p. 549; and chap. i. vol. i. p. 84; Hamilton's *New Account of the East Indies* (Edin. 1727), vol. i. pp. 274 and 308; Reade's *Savage Africa*, p. 43; Erman's *Travels in Siberia*, vol. ii. p. 531; *Marriage Ceremonies*, by Seigneur Gaya (translation), 2d edition (Lond. 1698) pp. 70 and 96; Emerson Tennent's *Ceylon*, 3d edition (1859), vol. ii. p. 429; Legend of Rupe, Grey's *Polynesian Mythology*, 1855, p. 81; *A Summer Ramble in the Himalayas* (1860), p. 202; Vigne's *Kashmir*, vol. i. p. 37; *Journal Asi. Soc. Bengal*, vol. ix. p. 334; and *Asiat. Resch.* vol. v. p. 13.

From ancient history we learn that the area over which polyandry at one time existed was even more extended; while in certain cantons of Media, according to Strabo (lib. ii. p. 798, and see Goguet, vol. iii. book vi. c. i.) polygynia was authorised by express law, which ordained every inhabitant to maintain at least seven wives; in other cantons, precisely the opposite rule prevailed: a woman was allowed to have many husbands, and they looked with contempt on those who had less than five. Cæsar informs us that in his time polyandry of the Tibetan type prevailed among the Britons (*De Bello Gallico*, lib. v. c. xiv.). We find direct evidence of its existence among the Picts in the Irish Nennius App. li., not to mention the traces of it remaining in the Pictish laws of succession. Indeed, to pass over communities in which something like promiscuity of intercourse between the sexes is said to have prevailed—such as the Massagete, Agathyrsi, and the ancient Spartans—we find several among which polyandry, or a modified promiscuity, must have been the rule. Assuming, that the legal obligation laid on younger brothers in their turn to marry the wives of their deceased elder brother, is a relic of polyandry of the Tibetan type, then we must hold that polyandry prevailed at one time throughout India (*Institutes of Menu*, chap. iii. s. 173, and chap. ix. ss. 57, 58), among the ancient Hebrews (Deut. xxv. verses 5—11); in Siam, Burmah, in Syria among the Osiaks, the But (Bodo), the Kasia, and the Puharies of Gurhwal. Traces of it indeed remained in the time of Tacitus among the Germans (*Tac., Germ.*, xx., Latham's edition, p. 67 and seq.). In short, polyandry may be regarded as one of the transitional forms in the advance from a state of promiscuity, on the assumption that pure promiscuity ever existed. Of the origin of this peculiar institution, our space forbids us to write; but we believe it to be connected with the want of balance between the numbers of the sexes, due to the practice of female infanticide, which is its almost invariable accompaniment. Tribes of warriors, wholly devoted to a military life, find women an incumbrance rather than a solace; and from this cause, and probably from the difficulties of subsistence, formed the practice of killing their female children, sparing them only when they were the first-born. The disparity of the sexes would lead to polyandry, and once instituted, the custom would in many cases continue to exist after the habits and necessities which produced it disappeared. In several places, as in Ladak, where polyandry prevails, the sexes are now either equally balanced, or the female sex predominates. In these cases, polygynia and polyandry are commonly found existing side by side. The subject is one which demands, and as yet has not received, full investigation.

POLYANTHUS (Gr. many-flowered), a kind of *Primrose* (q. v.), much prized and cultivated by

florists. It is generally believed to be a variety of the Common *Primrose* (*Primula vulgaris*), produced by cultivation, in which an umbel of numerous flowers is supported on a common *scape* (leafless flower-stem), instead of each flower rising on its own stalk from the crown of the root; a modification to which a tendency often appears in the wild plant itself. Thus, in its habit it somewhat resembles the cowslip and oxlip, whilst in the size of its flowers it is more like the common primrose; but instead of the pale uniformity of the wild plant, it exhibits

Polyanthus.

great variety of delicate and beautiful colours. The subvarieties are innumerable, new ones being continually produced from seed, and of short duration. The seed is sown about midsummer, and flowers may be expected in abundance next year, if the young plants are properly planted out. A rich free soil is most suitable. The P. loves shade and moisture more than its congener, the auricula. It is very hardy, and seldom suffers from the most severe winters. Fine kinds are preserved for a time by dividing the root. The cultivation of the P. is prosecuted with particular assiduity and success in England.

POLYANTHUS NARCISSUS. See **NARCISSUS**.

POLYATOMIC ALCOHOLS. The term *Alcohol*, originally limited to one substance—viz., spirit of wine, or hydrated oxide of ethyl, has begun to be applied to a considerable number of organic compounds, many of which, in their external characters, bear little resemblance to common alcohol. Most of them are fluid and volatile, some of them are combustible, and all of them are composed of carbon, hydrogen, and oxygen, behave in a precisely similar manner towards the same decomposing agents, and are perfectly neutral to test-paper.

Every alcohol, when acted on by oxidising agents, loses two equivalents of hydrogen, and is converted into an *Aldehyde*; and by the prolonged action of the oxidising agent, the aldehyde takes up one equivalent of oxygen, and is converted into a *special acid*. Moreover, all alcohols, by the abstraction of the elements of water, yield simple ethers. Hence, every alcohol has its own ether, aldehyde, and special acid; the aldehydes of the alcohols termed polyatomic have, however, not been formed.

According to the theory of organic radicals, the alcohols are hydrated oxides of an alcohol radical. Thus, common alcohol, or spirit of wine, is the hydrated oxide of the radical ethyl (C_2H_5), and is represented by the formula $C_2H_5O = C_2H_5.H_2O$; similarly,

wood-spirit is the hydrated oxide of the radical methyl (CH_3), and is represented by the formula $\text{CH}_4\text{O}_2 = \text{CH}_3\cdot\text{H}_2\text{O}$. According to the theory of chemical types (q. v.), the alcohols are divided into several homologous groups, whose rational formulæ may all be derived from one, two, or three molecules of water, $\text{H} \left\{ \begin{smallmatrix} \text{H}_2 \\ \text{H} \end{smallmatrix} \right\} \text{O}, \text{H}_2 \left\{ \begin{smallmatrix} \text{H}_2 \\ \text{H}_2 \end{smallmatrix} \right\} \text{O}_2,$

$\text{H}_3 \left\{ \begin{smallmatrix} \text{H}_2 \\ \text{H}_3 \end{smallmatrix} \right\} \text{O}_3$, by substitution of an organic radical containing hydrogen and carbon for half the hydrogen of the type. Alcohols are accordingly monatomic, diatomic, or triatomic, e. g.: Ethyl-alcohol (monatomic) $= \text{C}_2\text{H}_5 \left\{ \begin{smallmatrix} \text{H}_2 \\ \text{H} \end{smallmatrix} \right\} \text{O}$, Glycol (diatomic) $= (\text{C}_2\text{H}_4) \left\{ \begin{smallmatrix} \text{H}_2 \\ \text{H}_2 \end{smallmatrix} \right\} \text{O}_2$, Glycerin (triatomic) $= (\text{C}_3\text{H}_5) \left\{ \begin{smallmatrix} \text{H}_2 \\ \text{H}_3 \end{smallmatrix} \right\} \text{O}_3$.

Of monatomic alcohols there are several series containing radicals whose general formulæ are, $\text{C}_n\text{H}_{2n+1}$, $\text{C}_n\text{H}_{2n-1}$, $\text{C}_n\text{H}_{2n-3}$, $\text{C}_n\text{H}_{2n-7}$.

Diatomic alcohols, or Glycols, are derived from a double molecule of water, $\text{H}_2 \left\{ \begin{smallmatrix} \text{H}_2 \\ \text{H}_2 \end{smallmatrix} \right\} \text{O}_2$, in which half the hydrogen is replaced by a diatomic radical, C_nH_{2n} . Hydrate of Ethylene, $\text{C}_2\text{H}_4\text{O}_2$, or Glycol is an example.

Triatomic alcohols, or Glycerin, are compounds derived from a triple molecule of water, $\text{H}_3 \left\{ \begin{smallmatrix} \text{H}_2 \\ \text{H}_3 \end{smallmatrix} \right\} \text{O}_3$, by replacing one-half of the hydrogen by a triatomic radical, $\text{C}_n\text{H}_{2n-1}$; glycerin is one term of this series.

POLYBASIC ACIDS. Most of the inorganic acids combine with bases in such a manner that one atom of the hydrogen is replaced by one atom of metal to form a neutral salt. Nitric acid may be taken as an illustration of the acids possessing this property, and which may therefore be called *monobasic*. In other cases, as, for example, that of pyrophosphoric acid (see PHOSPHORUS), one atom of the hydrogen possesses the property of combining with two atoms of base; such acids are termed *bibasic* or *dibasic*. There are strong grounds for believing that sulphuric acid is *bibasic*, in which case its formula would require to be doubled, and to be written $2\text{H}_2\text{O}, \text{S}_2\text{O}_6$. It is probable that tetrabasic acids exist, but none have yet been much investigated, though pyrophosphoric and silicic acids seem to be such. Sulphuric acid reacts with a large number of hydrogenised bodies to form new compounds by the elimination of water, which are either mono-, bi-, or tribasic, according to the number of atoms of water eliminated.

Amongst the organic acids, a similar relation takes place, acetic, succinic, and citric acids affording examples of the monobasic, dibasic, and tribasic class.

The following are the most important general differences shewn by acids of different degrees of basicity.

1. Each *monobasic* acid can form but *one* ether, which is neutral. 2. A *Monobasic* acid cannot form a stable, well-defined acid salt, or a salt with two or more metallic bases.

1. Each *dibasic* acid can form *two* ethers, one neutral, and the other acid. 2. *Dibasic* acids can form with each metallic base a neutral salt and an acid salt. They can also form double salts containing two metallic bases.

1. Each *tribasic* acid can form *three* ethers, one neutral, and two acid. 2. *Tribasic* acids can form *three* salts with the same metallic base, two of them acid, and one neutral.

Many attempts have been made to account for the polybasic or monobasic character of an acid, from its composition. According to Kekulé (*Lehrbuch der organisch. Chemie*, vol. 1, p. 210—219), the basicity depends not, as was formerly supposed,

on the molecular constitution of the acid, but upon the amount of oxygen contained in its radical. For further details on this subject, the reader is referred to the article ACIDS in Watt's *Dictionary of Chemistry*, vol. 1, 1868.

POLYBIUS, the Greek historian, was born about 204 B. C. in Megalopolis, a town of Arcadia. From Lycortas, his father, who was among the leading men of the Achaean League, he received valuable instruction in the science of politics and in the art of war. In 181, he would have visited Egypt in the capacity of ambassador, but the project of sending an embassy to that country was given up. His engaging in public affairs probably dates from this period; and he rapidly gained the confidence of his countrymen. He was one of the 1000 noble and influential Achaeans, who, after the conquest of Macedonia in 168, were sent to Rome on the summons of the commissioners from that city to answer the charge of having failed to assist the Romans against King Perseus. On their arrival in Italy in 167, they were not put upon their trial, but were distributed among the towns of Etruria. Owing, perhaps, to his having formed the friendship of Æmilius Paulus, or of his sons Fabius and Scipio, he was more fortunately allocated than others of his countrymen. His residence was fixed at Rome and in the house of Paulus. Scipio, then about 18 years of age, became strongly attached to P., made him his companion in all his military expeditions, and profited greatly by his knowledge and experience. P. in his turn derived much advantage from the protection and friendship of Scipio, who gave him access to public documents, and aided him in the collection of materials for his great historical work. In 151, the surviving Achaean exiles were permitted by the Roman senate to return to Greece, and among them was P., who arrived in Peloponnesus after a residence of 17 years in Italy. He soon, however, rejoined Scipio, followed him in his African campaign, and was present at the destruction of Carthage in 146. But the outbreak of war between the Achaeans and Romans summoned him again to Greece, where he arrived soon after the taking of Corinth. All his influence was now exerted to procure from the conquerors favourable terms for the vanquished; and so grateful were his countrymen for his services in their behalf, that they erected statues in his honour at Megalopolis (his native town), Mantinea, Pallantium, Tegea, and other places. It must have been about this time that P. undertook the writing of his great historical work, the materials of which he had so long been collecting. We cannot now fix with accuracy at what period of his life he visited in foreign countries the places which he had to describe in his history. We know from himself that at one time, probably while accompanying Scipio, he undertook long and laborious journeys into Africa, Spain, Gaul, and even as far as the shores of the Atlantic, in order to add to the scanty knowledge previously existing with regard to these regions. In the latter period of his life, he travelled in Egypt; and about twelve years before his death, he probably accompanied Scipio to Spain, where he witnessed the fall of Numantia. He died about 122 B. C., in his 82d year, in consequence of a fall from his horse.

As a historian, P. occupies a high rank. His work, which began where that of Aratus broke off, includes the period between 220 and 146 B. C., the year when Corinth fell, and, with it, the independence of Greece. Of the two parts into which it was divided, the first embraced a period of 53 years, commencing with the Second Punic War and the Social War in Greece, and concluding with the subjugation of the kingdom of Macedonia in 168. This, the chief

portion of his history, was designed to shew how, in the short space of 53 years, the greater part of the world had been conquered by the Romans; and in order that his countrymen might have a better knowledge than they possessed of the rise of that people, he gives a sketch of the history of Rome from its capture by the Gauls to the outbreak of the Second Punic War. This occupies the first two books, and may be regarded as an introduction to the work. The second part embraces the period from the fall of the Macedonian kingdom, in 168, to the taking of Corinth in 146. This part is to be viewed as supplementary to the first, and seems to have brought down the history of the conquest of Greece to its completion in the 39th book, while the 40th and last probably contained a chronological summary of the entire work. The style of P. is not his most striking feature, and he incurred the censure of later Greek critics for his negligence in the choice of words and in the structure of his sentences. His great merits are the care with which he collected his materials, his strong love of truth, and his sound judgment, which was materially assisted by his familiarity with political and military life. His tone is too didactic in general, and although his readers are prepared for this by his calling his work not a *Historia*, but a *Pragmateia*, still the continuity of the narrative is too often interrupted by digressions, sometimes interesting and valuable in themselves, but fatal to artistic effect. Much the greater part of his work has perished. Of the 40 books, we possess only five entire; and of the rest, merely fragments or extracts. Some of these latter, however—such as the account of the Roman army—are of considerable length and value, and four separate collections of them have been added from time to time to the remains of the work. The first of these, discovered soon after the revival of learning, in a MS. of Corfu, gives us the greater part of the 6th book, and portions of the remaining 11. The second consists of extracts made in the 10th c., entitled *Excerpta de Legationibus*, and published at Antwerp by Ursinus in 1582. The third, entitled *Excerpta de Virtutibus et Vitiis*, was published in 1634 by Valesius. The fourth, entitled *Excerpta de Sententiis*, was discovered by Cardinal Mai in the Vatican, and published by him at Rome in 1827. The history of P. was very closely followed by Livy after the period of the Second Punic War, and by Cicero in his account of the Roman constitution in his treatise *De Republica*.—The best annotated edition of P. is Schweighäuser's (Leip. 1789). The best edition of the text, including that of the Vatican fragments, is that of Bekker (Ber. 1844).

POLYCARP, Bishop of Smyrna, and one of the most illustrious of the early Christian martyrs, was born in the latter part of the 1st c. A. D., but neither the date nor the place of his birth is known. He was, however (according to a legendary fragment ascribed to an unknown Pionius), brought up at Smyrna, where his pupil, Irenæus, states that P. was taught the doctrines of Christianity by the apostles, particularly by John, with whom he had 'familiar intercourse.' The testimony of Irenæus on this point is of immense value, as it furnishes the chief historical link uniting the apostolic age—that age which is reflected in the later parts of the New Testament—with the rising church of the 2d century. The passage occurs in an expository epistle to a Roman heretic, Florinus, and is preserved by Eusebius (*Hist. Eccl.*, ch. xx.). 'I can tell also the very place where the blessed Polycarp was accustomed to sit and discourse; and also his entrances, his walks, the complexion of his life, and the form of his body, and his conversations with the

people, and his familiar intercourse with John, as he was accustomed to tell, as also his familiarity with those that had seen the Lord. Also concerning his miracles, his doctrine, all these were told by Polycarp, in consistency with the Holy Scriptures, as he had received them from the eye-witnesses of the doctrine of salvation.' The fragment of Pionius (to which reference has already been made) informs us that P., when only a little child, was adopted by a rich Christian lady named Callisto, who left him heir to all her wealth; in consequence of which he was enabled to gratify his love of works of beneficence and charity. We are, however, utterly without the means of determining what truth (if any) there is in the narrative of Pionius, and can only feel certain that in some way or other he had distinguished himself at a comparatively early period, for before the death of the Apostle John (i. e., at the latest, before 104 A. D.), he was ordained Bishop of Smyrna (according to Tertullian and Jerome) by John himself; according to Irenæus, by 'the apostles;' and according to Pionius, by 'the bishops of the neighbouring churches'—statements which are quite reconcilable with each other. P. was in the exercise of his episcopal functions when Ignatius of Antioch passed through Smyrna on his road to Rome (107–116 A. D.); and we are told that the two pupils of St John, who had probably known one another in earlier years, had much delightful Christian converse. Almost half a century afterwards, P. himself visited Rome, when Anicetus was bishop there (157–168 A. D.), and had a friendly conference with his brother on the subject of the proper time to hold Easter. They could not agree—but they agreed to differ. His martyrdom, which is related at great length and in a touching manner by Eusebius (*Hist. Eccl.* chap. xiv.), took place probably in 166 A. D., during the persecution under the emperors Marcus Aurelius and Lucius Verus. When asked, or rather entreated 'to revile Christ' by the proconsul Statius Quadratus, who, being deeply impressed with the venerable appearance of the aged bishop, wished if possible to save his life, P. replied: 'Eighty-and-six years have I served him, and He never did me wrong; and how can I now blaspheme my King that has saved me?' P. was burned alive. In such profound reverence was he held by his fellow-Christians, for his almost perfect graces of character, that the Jews (who had been conspicuously zealous in collecting 'wood and straw from the shops and baths' to burn him) instigated the proconsul not to give up the corpse of the martyr to his co-religionists, 'lest, abandoning him that was crucified, they should begin to worship this one.' More convincing evidence of a saintly character has never been adduced.

P. wrote several *Epistolæ*, of which only one has been preserved, the *Epistola ad Philippenses*, valuable for its numerous quotations from the New Testament—especially from the writings of Paul and Peter. It has been frequently printed, the latest editions being those of Jacobson (*Patrum Apostolicorum quæ supersunt*, vol. ii., Oxford, 1838) and Hafele, *Patrum Apostolicorum Opera* (Tübingen, 1839). There are English versions by Cave, Clementson, and Wake.

POLYCHROME PRINTING, the art of printing in one or more colours at the same time. Although several attempts had been previously made to carry out this process, Congreve, in 1820, was the first to do it successfully with metal plates. Sir William Congreve had seen Applegath's polychromatic block-printing press, by which very rude coloured pictures were produced, and he conceived the idea of improving upon it, and doing it with

metal. His plan is extremely simple, though requiring great nicety in carrying it out. First, the picture is outlined upon a metal-plate; and supposing it intended to have two colours, then the details of only the chief colour are completed upon it, and all the parts for the other colour are cut out; and into those parts other plates are fitted, like the portions of a child's puzzle-map, but with very great exactness; and upon these the engraving for the parts of the second colour are completed. When these are done, a thickness of type-metal is attached to the back of these interior pieces, so that they can be held separately, and pushed forwards or drawn backwards at pleasure. Then they are so adjusted to the machinery of the press, that they are withdrawn when the first colour-roller passes over the surface of the main plate, and are pushed forward beyond the face of the main plate, so as to receive the colour of the second roller, which then passes over them without touching the first or main plate. Having received their coloured ink, the secondary plates are again moved back to a perfect level with the other, so as to form an entire plate, carrying two colours, which are thus, in the ordinary way, imprinted on the paper. Since Sir William Congreve's patent, very many improvements have been made, the principle, however, remaining the same, and it has now a very wide application.

POLYCOTYLEDONOUS PLANTS, those plants of which the embryo has more than two seedlobes or cotyledons. See **COTYLEDON** and **DICOTYLEDONOUS PLANTS**. In some of the *Coniferae* in particular, there are numerous cotyledons; the genus *Pinus* has from three to twelve. These cotyledons are placed in a whorl, and have the gemmule of the embryo in the midst of them. Polycotyledonous plants do not form a separate division of the vegetable kingdom, but are ranked with dicotyledonous plants; for plants with two, and plants with more cotyledons, are found not only in the same natural order, but in the same genus.

POLYCRATÉS, 'tyrant' of Samos, is a well-known name in ancient Greek history. He was born in the first part of the 6th c. B. C., but nothing is known of him until the time when, with the assistance of his brothers Pantagnotus and Sylosón, he obtained possession of the island. The three brothers at first ruled conjointly, but after a short time, P. put Pantagnotus to death, banished Sylosón, and made himself sole despot. His energetic, unscrupulous, and ambitious character now shewed itself more conspicuously than ever. He conquered several islands of the Archipelago, and even some towns on the Asiatic mainland, waged war successfully against the inhabitants of Milétus, and defeated their allies, the Lesbians, in a great sea-fight. His fleet amounted to 100 ships, and was probably at that time the most powerful in all Greece. P. seems to have aspired to the sovereignty of the *Ægean*, if not also of the cities of Ionia. His intimate alliance with Amasis, king of Egypt, proves the importance in which this daring island-prince was held even by great monarchs. According to Herodotus, Amasis drew off from his alliance through alarm at the uninterrupted good fortune of Polycratés. He dreaded, we are told, the misfortunes that the envious gods must be preparing for so lucky a mortal, and to which his friends would also be exposed. The particular incident that is said to have finally ruptured the alliance is doubtless mythical, but it is so well known that we cannot afford to overlook it. Amasis is reported to have written a letter to P., earnestly advising him to throw away the possession that he deemed most valuable, and thereby avert the stroke of the

splendid gods. P., in compliance with this friendly advice, cast a signet-ring of marvellously beautiful workmanship into the sea, but next day a fisherman presented the 'tyrant' with an unusually big fish that he had caught, and in its belly was found the identical ring. It was quite clear to Amasis now that P. was a doomed man, and he immediately broke off the alliance. So, at least, Herodotus tells the story, but Grote (*History of Greece*, vol. iv. page 323) suggests—and the suggestion is far more probable—that P., with characteristic perfidy, abandoned the Egyptian for a Persian alliance, when he found the latter likely to be of more value to him in his ambitious designs. When Cambyzes invaded Egypt (525 B. C.), P. sent him a contingent of forty ships, in which he placed all the Samians disaffected towards his 'tyranny,' and told the Persian king privately not to let them come back! However, they escaped in some way or other the fate which P. had designed for them, returned to Samos, and made war against the 'tyrant,' but without success. Hereupon, they went to Sparta, and succeeded in enlisting the sympathies, or, at any rate, in securing the help of both the Spartans and Corinthians. A triple force of Samians, Spartans, and Corinthians embarked for Samos, and attacked the city. After vainly besieging it for forty days, they sailed away, and P. now became more powerful than ever; but Nemesis had her victim after all. A certain Oretes, the Persian satrap of Sardis, had, for unknown reasons, conceived a deadly hatred against P., and having enticed the latter to visit him, by appealing to his cupidity, he seized and crucified him. Thus perished ignominiously, in the midst of his power and splendour, one of the most famous *thalassocrats*, or sea-kings, of Greek antiquity. He was a patron of literature and the fine arts, and had many poets and artists about his court. His intimacy with Anacreon, in particular, is quite a celebrated thing, and in his praise that joyous bard wrote many songs. To P. also, in all probability, belongs the construction, or at least the enlargement, of those great buildings which Herodotus saw at Samos.

POLYDIPSIA (Gr. *great thirst*) is the term now commonly applied to the disease formerly known as *Diabetes insipidus*. It is characterised, as its name implies, by extreme thirst, and by an enormous discharge of pale watery urine. The affection is one of rare occurrence, and the persons most liable to it are dyspeptics who have passed the period of middle life, and whose bodily powers are failing, although (as the case we shall immediately notice, and one recorded by Dr Watson, shew) it may begin in childhood. The two prominent features of this disease usually lead to the suspicion that true diabetes is present; but the low specific gravity of the urine, and the absence of sugar in it in polydipsia, and the reverse condition in diabetes, seem to make the distinction easy. Dr Willis, in his work *On Urinary Diseases*, records the case of a man, aged forty-five, who was admitted for an accident into the Hôtel-Dieu at Paris, and who passed, daily, on an average, thirty-four pounds of urine, and drank thirty-three pounds of water, the normal daily excretion of urine being a little less than two pounds. This person reported that he had been affected in a similar manner ever since his fifth year, and that, from the age of sixteen upwards, he had daily consumed not less than two bucketfuls of water, and discharged a commensurate quantity of urine. Little good can be effected by treatment, further than stimulating the action of the skin by the use

of Dover's powder, Turkish baths, &c., and by inducing the patient to take as little drink as may be at all consistent with his comfort.

POLYGALÆE, or **POLYGALACEÆ**, a natural order of exogenous plants, herbaceous or shrubby, sometimes twining; the leaves without stipules, and generally simple; the flowers resembling papilionaceous flowers, but the odd petal inferior, and the odd sepal superior; the flower-stalks with three bracts; the calyx of five very irregular sepals; of which the two interior are usually petal-like; the corolla of three, or sometimes five petals, the anterior petal the largest, and often crested; stamens eight, monadelphous or diadelphous, or four and distinct; the ovary superior, generally 2-celled, one ovule in each cell; style and stigma simple; fruit generally a capsule opening by valves, sometimes a drupe. There are about 500 species, diffused throughout all parts of the world.—The genus *Polygala* has a persistent calyx, eight stamens, the lateral sepals large and petal-like, and hairy or wrinkled seeds. The species are very numerous, annual and perennial herbaceous plants, and small shrubs, natives chiefly of warm and temperate climates. One is found plentifully in Britain; the **COMMON MILKWORT** (*P. vulgaris*), a small perennial plant, growing in dry

Common Milkwort (*Polygala vulgaris*).

afily pastures; with an ascending stem, linear-lanceolate leaves, and a terminal raceme of small but very beautiful flowers, having a finely crested keel. It varies considerably in size, in the size and even shape of the leaves, and in the size and colour of the flowers, which are sometimes of a most brilliant blue, sometimes purple, pink, or white.—Several species are natives of the south of Europe.—North America produces a greater number. The Cape of Good Hope and other subtropical countries produce many beautiful species, some of which have become common ornaments of greenhouses.—*P. Senega* is a North American species, with erect simple tufted stems, about one foot high, and terminal racemes of small white flowers. The root, which is woody, branched, contorted, and about half an inch in diameter, is the **SENEGA ROOT**, **SENEKA ROOT**, or **SNAKE ROOT** of the United States, famous as an imaginary cure for snake-bites, but really possessing

important medicinal virtues—stimulating, diuretic, diaphoretic, emmenagogue, and in large doses emetic and purgative—employed in catarrhs, pulmonary affections, rheumatisms, low fevers, &c. Its chief active principle is *Polygalic Acid*, or *Saponin*. The root of *P. Senega* has been employed as a cure for snake-bites by the American Indians from time immemorial, and it is a curious fact, that *P. crotonioides* is employed in the same way in the Himalaya. *P. vulgaris* is tonic, stimulant, and diaphoretic; and *P. amara*, a very similar European species, possesses the same properties in a higher degree, as does *P. rubella*, a small North American species. The root of *P. poaya*, a Brazilian species, with leathery leaves, is an active emetic, and in a fresh state, is employed in bilious fevers. Similar properties seem to pervade the whole genus. Another medicinal plant of the order is *Rattany* (q. v.) root. Species of several genera are used as tonics. The bark of the roots of *Monnina polystachia* and *M. salicifolia* is used in Peru as a substitute for soap. *Mundia spinosa*, a South African shrub, produces an eatable fruit.

POLYGAMOUS (Gr. *polys*, many, *gamê*, marriage), in Botany, a term employed to designate those plants which produce both unisexual and hermaphrodite flowers either on the same or different plants. In the Linnæan sexual system, these plants formed a class, **POLYGAMIA**, the genera included in which were perhaps more completely disjoined from their natural allies than those of any other class of that system, forming by themselves a very heterogeneous assemblage.

POLYGAMY. See **MARRIAGE**.

POLYGASTRICA. See **INFUSORIA**.

POLYGLOT (Gr. *polys*, many; and *glôta*, tongue) means, in general, an assemblage of versions in different languages of the same work, but is almost exclusively applied to manifold versions of the Bible. The Hexapla (q. v.) of Origen contained, besides the Hebrew text, several other versions. All these, however, were in the Greek language; and the Hexapla is not commonly reckoned among the polyglots. They are divided into two classes, the greater and the lesser polyglots. To the former belong four works, known as the Complutensian Polyglot; the Antwerp or king of Spain's Polyglot; the Parisian Polyglot; and the London or Walton's Polyglot.—The Complutensian Polyglot derives its title from Complutum, the Latin name of Alcalá de Henares, where it was printed in 6 vols., folio, 1502—1517. It was published at the cost, and under the direction of the celebrated Cardinal Ximenes, who spared no expense, whether in collecting the most ancient and authentic MSS., or in bringing together the most distinguished scholars of all countries for the carrying out of his design. The Complutensian Polyglot contains, besides the Hebrew text, the Septuagint Greek and the Chaldee (each with a literal Latin version), and the Latin Vulgate.—The Antwerp Polyglot, so called from its being there printed (1569—1572), at the celebrated press of Plantin, was published at the cost of Philip II. of Spain, under the direction of the distinguished scholar, Benedict Arias Montanus. It is in eight vols. folio, and contains, in the Old Testament, the Hebrew, the Greek, the Targum of Onkelos, and the other Chaldee paraphrases, and the Latin Vulgate. In the New Testament, besides the Greek and Latin, it contains a Syriac version, printed both in Syriac and in Hebrew characters. Arias Montanus was assisted by many scholars of eminence, chiefly of Spain and the Low Countries.—The Parisian Polyglot was printed at Paris in 1645, at the cost and under the editorship of Guy Michel

le Jay. It is in ten splendid volumes, and contains, in addition to the contents of the Antwerp Polyglot, another Syriac version, and an Arabic version, together with the Samaritan version and the Samaritan text of the Pentateuch, each of these being accompanied by a literal Latin translation.—The London Polyglot was edited by Brian Walton, afterwards Bishop of Chester, and it engaged for many years a number of the most eminent linguists of the period. The number of its languages is not the same in all parts of the Bible; but it may be said to contain the Bible, or portions of it, in nine languages—Hebrew, Samaritan, Chaldee, Syriac, Arabic, Ethiopic, Persic, Greek (each of these accompanied by a literal Latin version), and Latin. It is in six vols. folio, and was published in 1654–1657; and was followed, in 1669, by the *Lexicon Heptaglotton* of Edmund Castell, two vols. folio, containing dictionaries of all the languages of the polyglot, except the Greek and Latin. Of the minor polyglots, the chief are (1) the Heidelberg Polyglot (1586), Hebrew, Greek, and Latin; (2) Wolder's Polyglot (Hamburg, 1596), Hebrew, Greek, Latin, and German; (3) Hutter's Polyglot (Nürnberg, 1599), Hebrew, Chaldee, Greek, Latin, German, and French; (4) Reinecius's Polyglot, in Syriac, Greek, Latin, and German (Leipzig, New Testament, 1712; Old Testament, 1750, 1751); (5) Bagster's Polyglot, a very valuable collection of modern versions, folio (London, 1868). It contains eight versions in the Old Testament, viz., Hebrew, Greek, English, Latin, French, Italian, Spanish, and German; and nine in the New, Syriac being added to those already named. (6) A useful 'Hand Polyglot,' containing in the Old Testament, Hebrew, Greek, Latin, Vulgate, and Luther's German version; and in the New, Greek, Latin, Luther's German, and in the fourth column, in which are presented the chief differences between this and other German versions.

Besides the Bible, many other works, or small pieces, have been published in polyglot. Of smaller pieces, the Lord's Prayer has been the favourite, of which many collections, containing a greater or less number of languages, have been published from the 16th c. downwards. Of these, the most comprehensive, and, for philological purposes, by far the most valuable, is the well-known *Mihridates* of Adelung, which contains the Lord's Prayer in upwards of 400 languages, with vocabularies and grammatical explanations of most of the specimens.

POLYGNOTUS, a distinguished Greek painter of antiquity, was born towards the beginning of the 5th c. B. C. He was a native of the isle of Thasos, and belonged to a family of painters, who came to Athens to practise their profession probably after the subjugation of Thasos by Cimon. P. and his brother, Aristophon, were instructed in the principles of art by their father, Aglaophon. We know almost nothing of their lives, except that P. was a friend of the Athenian general above mentioned, and is said to have been attached to his sister, Elpinice. He died about 426 B. C. P. was a contemporary of the great sculptor, Pheidias (q. v.), and flourished during the supremacy both of Cimon and Pericles; but we hear little or nothing of him under the latter ruler; and although the first painter of his day, it does not appear that he was engaged in the decoration of any of those splendid buildings with which that statesman adorned Athens. It is not at all unlikely that Pericles was averse to patronising a friend of Cimon, and, at all events, P. was absent from Athens for 14 years (449–435 B. C.) of Pericles's rule, painting at Delphi and elsewhere. His principal works (following a chronological arrangement as far as it can be

ascertained) were: 1. Paintings in the Temple of Theseus at Athens. 2. In the Stoa Poecile (or Painted Portico) at Athens, representing the Greek princes after the taking of Troy, assembled to judge of the violation of Cassandra by Ajax. 3. In the Anakeion, or Temple of the Dioscuri, a painting of the marriage of the daughters of Leukippos. 4. In the Temple of Athena Areia at Plataea, a picture of Ulysses after having slain the suitors of Penelope. 5. In the Leschê (or 'Conversazione Saloon'), a famous quadrangular court, or peristyle, surrounded by colonnades, built at Delphi by the Cnidians. The walls of this edifice were covered by P. with a series of paintings representing the wars of Troy, and the return of the Greek chiefs, and considered P.'s masterpiece. 6. In the chamber adjoining the Propylæa of the Acropolis. From the criticism of the ancients, it seems quite clear that P. was a great advance on any of his predecessors. He was the first who gave life, character, expression to painting. According to Pliny, he opened the mouth and shewed the teeth of his figures; he was the first to paint women with transparent drapery, and with rich head-dresses. Lucian also speaks of his exquisite skill in painting eyebrows and the blush on the cheek; while Aristotle extols the ethical or ideal beauty of his conceptions, saying that P. 'represented men as better than they were,' and finding a parallel for his style in the epic poetry of Homer.

POLYGON (Gr. *polys*, many; *gōnia*, a corner), a plane figure, bounded by a number of straight lines; the name is conventionally limited to those plane figures whose bounding straight lines are more than four in number. Polygons of 5, 6, 7, 8, &c. sides are denominated pentagons, hexagons, heptagons, octagons, &c.; and when the number of sides exceeds twelve, the figure is merely mentioned as a polygon of so many sides. The quindecagon, of figure of 15 sides, is the only common exception to this rule. Polygons have many general properties; such as, that the sum of the angles of a polygon, when increased by four right angles, or 360° , is equal to twice as many right angles as there are sides in the polygon, and that (supposing the number of sides of the polygon to be expressed

by n) the number of its diagonals is $\frac{n(n-3)}{2}$; also

if a polygon of an even number of sides be circumscribed about a circle, the sums of its even and odd sides are equal; and if a polygon of an even number of sides be inscribed in a circle, the sums of its even and odd angles are equal. A polygon which has all its sides and angles equal is called a *regular* polygon. All polygons of this class are capable of being inscribed in, or circumscribed about, a circle; but though the problem is merely to divide the circumference of a circle into a number of equal parts corresponding to the number of sides in the polygon, geometry was till lately only able to perform it in those cases where the number of sides of the polygon belongs to one or other of the series 2, 4, 8, 16, &c.; 3, 6, 12, 24, &c.; or 5, 10, 20, 40, &c. Gauss (q. v.), however, in the beginning of the present century, shewed how it could be done in the case of all polygons the number of whose sides was of the form $2^n + 1$ (provided it be a prime number), or a multiple of this prime number by any power of 2. This discovery supplies us with innumerable series representative of the numbers of the sides of polygons which can be described around or inscribed in a circle, such as 17, 34, 68, &c.; 257, 514, 1028, &c.

POLYGONEÆ, or **POLYGONA'CEÆ**, a natural order of exogenous plants, mostly herbaceous plants, but including a few shrubs, and even trees. The

leaves are alternate, sometimes without stipules, but more generally with stipules cohering around the stem. The flowers are not unfrequently unisexual. They have an inferior, often coloured perianth, generally in four, five, or six segments; three to nine stamens inserted into the bottom of the perianth; a one-celled ovary, usually formed of three carpels, but containing only one ovule; styles and stigmas as many as the carpels of the ovary; the fruit generally a nut, often triangular, the seed with farinaceous albumen, which has an economic importance in buckwheat. A few species produce a succulent edible fruit. The order contains nearly 500 known species, natives of almost all parts of the world, but particularly abundant in the temperate regions of the northern hemisphere. Many of the species are common weeds in America, as different species of Dock (*q. v.*) and *Polygonum* Bistort (*q. v.*), Buckwheat (*q. v.*), and Sorrel (*q. v.*), belong to this order.—The genus *Polygonum* has a coloured perianth of five segments, stamens in two rows, styles more or less united at the base, and two or more in number; the fruit invested by the persistent perianth. The species are very numerous. A number are natives of Britain.—KNOT-GRASS (*P. aviculare*), a very common British weed, is one of the plants remarkable for most extensive distribution over the world. It is an annual of very humble growth, but very variable, with much branched trailing stems, small lanceolate leaves, and very small flowers, two or three together, in the axils of the leaves. Thunberg says that in Japan a blue dye is prepared from this plant. *P. amplibium*, one of the species often called *Persicaria*, is abundant about margins of ponds in the northern United States and throughout Europe, and is remarkable for the difference between the leaves which float on the water, as is often the case, and those on stems growing erect, the former being broad and smooth, the latter narrow and rough; the spikes of flowers being also of somewhat different form, the stamens in the flowers of the floating stems being shorter than the perianth, and those in the upright stems about as long as the perianth; differences which might be held to indicate different species, yet both may be found growing from one root. The stems have been used on the continent of Europe as a substitute for sarsaparilla. Some other species are occasionally used for medicinal purposes. *P. hydropiper*, often called SMART WEED, a plant common by the sides of lakes and ditches in the U. States, is acrid enough to be used as a vesicant. Several species are occasionally used for dyeing, as the SPOTTED PERSICARIA (*P. persicaria*), a very common weed on dunghills and in waste places in Britain; but the only species really important on this account is that called DYERS' BUCKWHEAT (*P. tinctorium*), a native of China, biennial, with ovate leaves and slender spikes of reddish flowers, the cultivation of which has been successfully introduced in France and Flanders. It yields a blue dye scarcely inferior to indigo.—*P. orientale* has long been occasionally cultivated in flower-gardens in Britain, and is quite hardy, although a native of the West Indies.—*Eragrostis cymosum*, a species of buckwheat abundant on the mountains of the north of India, affords an excellent substitute for spinach.—*Muhlenbeckia adpressa* is the Macquarrie Harbour Vine of Van Diemen's Land, an evergreen climbing or trailing shrub of most rapid growth, sometimes 60 feet in length. It produces racemes of fruit somewhat resembling grapes or currants, the nut being invested with the large and fleshy segments of the calyx. The fruit is sweetish and subacid, and is used for tarts. *Coccoloba uvifera* is the

SEASIDE GRAPE (*q. v.*) of the West Indies. See also CALLIGONUM.

POLYHYMNIA, or POLYMNIA ('the Many-hymned One'), one of the nine Muses (*q. v.*). She was reputed by the ancients to be the inventress of the lyre, and to preside over lyric poetry and eloquence. In works of art, she is usually represented in a pensive attitude, with the forefinger of the right hand upon the mouth.

POLYMERISM, a form of ISOMERISM (*q. v.*).

POLYNEMUS and POLYNEMIDÆ. See MANGO FISH.

POLYNESIA, or the region of many islands (*Gr. polys*, much or many, and *nesos*, an island), is the name usually given, with more or less of limitation, to the numerous groups of islands, and some few single islands, scattered throughout the great Pacific Ocean, between the eastern shores of Asia and the western shores of America. In its widest signification, the term P. might be understood as embracing, besides the groups hereafter to be mentioned, the various islands, large and small, of the Indian Archipelago, in one direction; and the vast island of New Holland or Australia, with its dependency of Van Diemen's Land, in another. Including these, the whole region has sometimes been called Oceania, and sometimes Australasia—generally, however, in modern times, to the exclusion of the islands in the Indian Archipelago, to which certain writers have given the name of Malaysia. In proportion, also, as the area of maritime discovery has become enlarged, it has been thought convenient by some geographers to narrow still further the limits of P., to the exclusion of Australia and Van Diemen's Land; while others, again, exclude Papua or New Guinea, New Ireland, Solomon's Isles, the Louisiade group, the New Hebrides, New Caledonia, and certain other groups and single islands, together with New Zealand, from the area of P., and give to these, in union with Australia, the collective designation of Australasia. To all these, with the exception of New Zealand, French writers have given the name of *Melanesia* or the *Black Islands*; while a similar name, *Kelanesia*, has been given to them by Prichard and Latham—purely, however, on ethnological grounds, as we shall presently notice.

Thus, we have the three geographical divisions of Malaysia, Australasia, and P., the last mentioned of which embraces all the groups and single islands not included under the other two. Accepting this arrangement, still the limits between Australasia and P. have not been very accurately defined; indeed, scarcely any two geographers appear to be quite agreed upon the subject; neither shall we pretend to decide in the matter. The following list, however, comprises all the principal groups and single islands not previously named as coming under the division of Australasia: viz., 1. North of the equator.—The Ladrone or Marian Islands, the Pelew Islands, the Caroline Islands, the Radack and Rakick chains, the Sandwich Islands, Gilbert's or Kingsmill's Archipelago, and the Galapagos 2. South of the equator.—The Ellice group, the Phoenix and Union groups, the Fiji Islands, the Friendly Islands, the Navigator's Islands, Cook's or Harvey Islands, the Society Islands, the Dangerous Archipelago, the Marquesas Islands, Pitcairn Island, and Easter Island.

These islands, which extend from about 20° north of the equator to about 30° south of it, are some of them volcanic in their origin, and some of them coralline. The volcanic islands generally rise to a considerable height above the level of the ocean, and are therefore called the high

islands, in contradistinction to the coralline or low islands. They consist of basalt and other igneous formations. Of these, the principal are the Friendly Islands, one of which, Otaheite or Tahiti, has a mountain rising to the height of 10,000 feet; the Marquesas Islands, also very high; the Samoan or Navigator's Islands; and the Sandwich Islands, of which Owyhee or Hawaii possesses several both active and extinct craters, 13,000, 14,000, and even 16,000 feet high. The Galapagos group, nearest of all to South America, are likewise of igneous origin, and have several still active craters. The remaining islands are for the most part of coralline formation.

The coral islands (q. v.) may be distinguished into three classes—namely, atolls or lagoon islands, barrier reefs, and fringing reefs. The atolls are rings of coral reefs, surrounding a basin of sea-water of considerable depth, which is enclosed within this area. Examples of these are found in the Caroline Islands, the Dangerous Archipelago, and several other groups. Barrier reefs differ from the atolls chiefly in the fact of their containing an island in their centre, the island being separated from the reef by a body of deep water; while the reef is in some instances entirely converted into land, and in others the sea washes over it, except in certain portions, which project above the level of the ocean. Barrier reefs occur among the Society Islands, the Gambier Islands, and many other groups. Fringing reefs are collections of coralline formation, which are found skirting the coasts of an island in the same manner as the barrier reefs, but without any interior deep water channel. They are found in almost all the groups. From the fact of some of these islands being undoubtedly volcanic, it has been argued that all were originally of the same character; those of coralline formation being based upon the crests of submarine volcanoes, over which the coral insects have for an indefinite series of years been engaged in rearing their limestone structures. In opposition to the volcanic theory, Dr Darwin has propounded one of his own—namely, the *theory of subsidence*, which, after mature consideration, he believes to be the only one capable of explaining the various phenomena observable in the coral atolls, barrier reefs, and fringing reefs of the Pacific. All these he considers as being the production of saxigenous insects, working upwards from the foundations of what were originally so many islands, erect above the surface of the ocean, but which during long ages have been in a state of gradual subsidence. With respect to the atolls, he states it as his belief, that the lagoon is precisely in the place which the top of a shoal, and, in other cases, the highest part of an island, once occupied. So soon as these have sunk to a depth of from 120 to 180 feet below the surface, the coral insects (which it is agreed are never found at a lower depth) commence their operations, and these working on in countless myriads, the sunken island, or a portion of it, is in process of time again reared to the level of the surrounding sea. It would take too long to specify all the phenomena upon which Dr Darwin has based this ingenious theory, especially those connected with what are called the fringing reefs. It must be mentioned, however, that paradoxical as such a theory may seem, it has received the hearty support of no less distinguished a geologist than Sir Charles Lyell, who, in the early editions of his *Principles of Geology*, having held to the volcanic theory, has since abandoned it for that propounded by Dr Darwin. 'Nor is this all; for, in the last edition of Sir C. Lyell's work, we find him mentioning with approval Dr Darwin's 'important generalisation that the Pacific and Indian Seas, and some of the lands which border them, might

be divided into areas of elevation and areas of subsidence, which occur alternately.'

Of the islands generally, we need only further observe that, although situated within the tropics, the heat of the atmosphere is delightfully tempered by a succession of land and sea breezes. The soil is exceedingly fertile, and besides the vegetable productions found growing when the islands were first discovered by Europeans, it has given a welcome home to the orange, lemon, sugar-cane, guava, cotton, potato, melon, and other fruits and plants introduced by foreign visitants. The only native quadrupeds on any of the islands when first visited were pigs, dogs, and rats; but the ox, the sheep, the goat, and even the horse, have since been successfully introduced into many of the groups. The feathered tribes are numerous, likewise the insects, and the coasts everywhere abound with a vast variety of fish and crustacea, highly important as a matter of food to the inhabitants of those islands in which quadrupeds, whether native or introduced, are found in only a small number.

For a more particular description of the several groups, we refer to the distinct articles of FIJIS, FRIENDLY ISLANDS, SANDWICH ISLANDS, &c.; and shall now proceed to speak of the inhabitants generally under the head

POLYNESIANS.—This race of people, supposed at one time by certain writers to be of American origin, is now almost universally admitted to have a close affinity with the Malays of the peninsula and Indian Archipelago, and hence is classified with them by Dr Latham under his subdivision of *Oceanic Mongoloidæ*. In physical structure and appearance, the Polynesians in general more nearly resemble the Malays than they do any other race, although differing from them in some respects, as, indeed, the natives of several of the groups also do from each other. In stature, they are generally taller than the Malays, and have a greater tendency to corpulence. In colour, also, they more nearly approach that of the Europeans. The hair is often waved or curling, instead of long and straight, and the nose is frequently aquiline. These differences, however, which may all have been produced by lapse of time and different conditions of existence, offer no barrier to the strong presumption, that at some long antecedent period these islands were colonised by Malay adventurers. The Malays are known at the present time to be expert and daring sailors, and in the 16th c. were so powerful at sea, that they had frequent naval combats with European fleets in the Indian Archipelago. In 1573, the king of Acheen, with a powerful armament, attacked and destroyed three Portuguese frigates; and in 1582, the same king attacked Malacca with a fleet of 150 sail. At a later period—namely, in 1615, one of his successors attacked the same settlement with a fleet of 500 vessels of various sizes and 60,000 men. If this was their strength and enterprise at a comparatively modern period, may they not have been as enterprising, if not quite so powerful, in far more remote times? The distance between the more western groups of P. and the eastern islands of the Indian Archipelago is not so great but that it could have been easily overcome by a hardy race of sailors, even although their vessels may have not been so well constructed as in modern times; and the same reasoning holds good with respect to the other groups extending still further east, or still more to the north or south. Each island or group, as it was attained, would only form a convenient point of departure in process of time for some other island or group more remotely situated. It is true that the affinities of language are not great between the Malays and the Polynesians; still, some affinity

has been recognised by philologists; while in their manners and customs a strong resemblance has been shewn to exist, as in the institution of caste, the practice of circumcision, the chewing of the betel-nut, and other things. Many other facts might be mentioned in favour of the theory of a Malay settlement, not only of P., but of the islands called Melanesia or Kelenonesia as well; the last mentioned being inhabited by a race almost identical with the Negritos or Pelagian Negroes of the Eastern Archipelago. Dr Latham, in treating of the Polynesians, divides them into two branches—viz., 1. The Micronesian branch, and 2. The Proper Polynesian branch. His theory as to the probable line of migration is as follows: 'The reason for taking the Micronesian branch before the Proper Polynesian, involves the following question: What was the line of population by which the innumerable islands of the Pacific, from the Pelews to Easter Island, and from the Sandwich Islands to New Zealand, became inhabited by tribes different from, but still allied to, the Protonesian Malays? That line, whichever it be, where the continuity of successive islands is the greatest, and whereon the fewest considerable interspaces of ocean are to be found. This is the general answer *à priori*, subject to modifications from the counterbalancing phenomena of winds or currents unfavourable to the supposed migration. Now, this answer, when applied to the geographical details regarding the distribution of land and sea in the great oceanic area, indicates the following line: New Guinea, New Ireland, the New Hebrides, the Fijis, and the Tonga group, &c. From hence, the Navigator's Islands, the isles of the Dangerous Archipelago, the Kingsmill and other groups, carry the frequently diverging streams of population over the Caroline Islands, the Ladrões, the Pelews, Easter Island, &c. This view, however, so natural an inference from a mere land and sea survey, is complicated by the ethnological position of the New Guinea, New Ireland, and New Hebrides population. These are not Protonesian, and they are not Polynesian. Lastly, they are not intermediate to the two. They break, rather than propagate the continuity of the human stream—a continuity which exists geographically, but fails ethnographically. The recognition of this conflict between the two probabilities has determined me to consider the Micronesian Archipelago as that part of Polynesia which is most likely to have been first peopled, and hence a reason for taking it first in order.' The islands comprised in the Micronesian branch are the Pelew Islands, the Caroline Islands, the Marian Islands, and the Tarawan or Kingsmill group. In physical appearance, the inhabitants of these groups more nearly resemble the Malays than is the case with the Polynesians Proper. In person, they are not so tall as the latter. Their language has numerous dialects, most of which would perhaps be unintelligible to the groups further south and east. In religion, they are pagans; but their mythology and traditions differ from those of the Polynesians Proper. Neither is the custom of the taboo and the use of kawa so prevalent as they are found to be among the latter. The Proper Polynesians, so called, are found in the Fiji Islands, but not to the same extent as in the following—viz., the Navigator's or Samoan Islands, the Society Islands, and Friendly Islands; also in the

Sandwich Islands, the Marquesas, the Dangerous Archipelago, &c. In physical appearance, they are the handsomest and tallest of all the natives of the Pacific Islands, with the exception, perhaps, of the New Zealanders or Maoris. The aquiline nose is commonly seen among them, and there are many varieties both of hair and complexion. Their face is generally oval, with largish ears and wide nostrils. In the islands nearest to the equator, the skin is said to be the fairest, and it is darker in the coral islands than in the volcanic. Their language is said to bear some affinity to the Tagala, and is split up into numerous dialects, all, however, to a great extent mutually intelligible among the several groups. Paganism, originally prevalent among all the groups, is becoming gradually extirpated through the efforts of the missionaries, principally English and American, as in the Samoan, Sandwich, and Society groups, where but few absolute pagans now remain. The superstition of the taboo, the use of kawa as an intoxicating drink, cannibalism, infanticide, tattooing, and circumcision, which were also formerly prevalent in all the groups, are now fast disappearing, under the influence of Christianity. Unfortunately, however, the contact of these islanders with civilisation has not been always productive of unmixed good; the introduction among them of the use of ardent spirits, and of the vices and diseases of Europeans, having thinned the population to a lamentable extent. Further particulars with respect to the natives of P. will be found in some of our articles on the groups regarded as being the most important.

POLYPHEMUS, in the Homeric mythology, the son of Poseidôn and the nymph Thoosa, the most celebrated of the fabulous Cyclops (q. v.) who inhabited the island of Sicily. He was of immense size, and had only one eye. When Ulysses landed on that island, he entered the cave of P. with twelve companions, of which number this tremendous cannibal ate six. The others stood expecting the same fate, but their cunning leader filled P. drunk, then burned out his single eye with a blazing torch, and so escaped, leaving the blinded monster to grope about in the darkness.

POLYPHEMUS, a genus of *Branchiopoda* (q. v.), of the order *Cladocera*, remarkable for the extraordinary size of the solitary eye, which occupies almost the whole head. One species, *P. stagnorum*, is common in stagnant pools and ditches in some parts of Britain and of the continent of Europe. It is about the size of a flea, and moves rapidly in the water, executing all kinds of evolutions, employing both its legs and antennæ as organs of swimming. The shell, consisting of two pieces, is so transparent that all the viscera may be seen through it. The abdomen is terminated by a long tail suddenly folded back.

POLYPHONIC (Gr. *polys*, many, and *phonè*, voice). When a musical composition consists of two or more parts, each of which has an independent melody of its own, it is said to be polyphonic, in opposition to a homophonic composition, consisting of a principal part with a leading idea, and accessory parts employed to strengthen it. Each part of a polyphonic composition aims at melodic perfection, and while supporting the other, has an equal share in the entire effect, as in the following example:

A Fugue (q. v.) is the most perfect example of polyphonic composition. The difference between homophonic and polyphonic compositions is not always so marked as to leave it free of doubt whether a part is subordinate or independent; and many compositions consist of an alternation of homophonic and polyphonic passages. The construction of polyphonic phrases is called Counterpoint.

POLYPI, or POLYPES, a class of animals which were, till the last few years, included in the RADIATA of Cuvier, but which, since the Radiata have ceased to be regarded as a sub-kingdom, have found a place in the sub-kingdom COELENTERATA. See SUB-KINGDOMS, ANIMAL. The name *Polypi*, or *Polypes*, was given by Reaumur about the middle of the last century to these animals, on account of their external resemblance to the many-armed cuttle-fishes, which were so denominated by Aristotle; and our knowledge of these organisms, as members of the animal kingdom, hardly dates back much more than a century. All polypes are aquatic in their mode of life, and almost all of them are inhabitants of the sea, two genera only (*Hydra* and *Cordylophora*) of fresh-water polypes being as yet known. Most of them live in societies of considerable extent, supported on a common stock, to which the term *polypidom* (polyp-home) is usually given, and which is sometimes horny, and sometimes calcareous. The polypes are either embedded in cavities in the substance of the calcareous polypidom, or enclosed in minute cups or tubes, from which the body can be protruded, and into which it can be retracted at pleasure, in the horny polypidoms. The solitary species often attain a considerable size (as, for instance, many of the Actinias); but the social polypes are always minute, although the combined power of some of the species in modifying the earth's crust is neither slight nor limited in extent. They have built up a barrier reef along the shores of New Caledonia for a length of 400 miles; and another, which runs along the north-east coast of Australia, 1000 miles in extent. To take a small example: a single atoll (or coral island) may be 50 miles in length by 20 in breadth; so that if the ledge of coral rock forming the ring were extended in one line, it would be 120 miles in length. Assuming it to be a quarter of a mile in breadth, and 150 feet deep, here is a mound, compared with which the walls of Babylon, the great wall of China, and the pyramids of Egypt are but children's toys; and built, too, amidst the waves of the ocean, and in defiance of the storms.—Owen, *Lectures on the Invertebrate Animals*, 2d edit., p. 143.

The bodies of these animals are generally soft, and cylindrical or oval in shape; and the mouth, which is the only aperture of the digestive canal, and is quite destitute of any masticating apparatus, lies in the centre of the anterior or free extremity of the body, and is surrounded by a fringe or circle of tentacles or arms. The skin in the social polypes is exceedingly soft and delicate; but in the solitary species, it is often of a leathery consistence. It almost always contains peculiar articulating organs, or thread-like cells, which may be regarded as one of the distinctive characters of the Coelenterata. Various arrangements of the polypes have been proposed, but it is sufficient for all practical purposes if we admit two orders—namely, the *Hydrozoa* and the *Anthozoa* (or *Actinozoa*), which differ essentially in the following points: in the *Hydrozoa*, the wall of the digestive sac is not separated from that of the somatic (or bodily) cavity, and the reproductive organs are external; while in the *Anthozoa*, the wall of the digestive sac is separated from that of the somatic cavity by an intervening space,

subdivided into chambers by a series of vertical partitions, on the faces of which the reproductive organs are developed. The *HYDRA* (q. v.), or Fresh-water Polype, is the type of the *Hydrozoa*. A few of these polypes are simple animals, as, for example, *Hydra*, *Corymorpha*, *Porticlavus*, and *Myriothela*; but the greater number are compound or composite, exhibiting a numerous colony, connected with one another by a common trunk or *cenosarc* (from the Gr. *koinos*, common, and *sarc*, flesh), which usually presents an erect tree-like form. A sufficient idea of the form and structure of the simple polypes of the class will be obtained by a reference to the article *HYDRA*, and by a glance at the accompanying figure of *Corymorpha nutans*, which attains a length

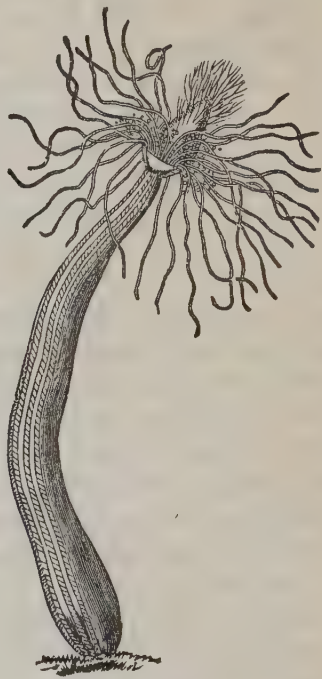

Fig. 1.—*Corymorpha nutans*

of between four and five inches, and was discovered by Forbes and Goodsir when dredging in the north of Scotland. They observe, that when it was placed in a vessel of sea-water, it presented the appearance of a beautiful pink flower, its head gracefully nodding (whence the specific name given to it by Sars, who had previously discovered it on the Norwegian coast), and bending the upper part of the stem; it waved its long white tentacles to and fro at pleasure, but seemed to have no power of contracting them. The compound *Hydrozoa* include, *inter alia*, the orders *Sertulariæ* (embracing the various species of *Sertularia*, *Campanularia*, *Lammedea*, &c.) and *Tubulariæ* (embracing the various species of *Tubularia*, *Eudendrium*, *Bimeria*, &c.). A good idea of the nature of the compound *Hydrozoa* may be formed from the consideration of the *Campanularia dichotoma*, a common organism on our shores. The compound polype-animal, or association of polypes, resembles a miniature tree. It consists essentially of a ramified tube of irritable matter, *f*, defended by an external flexible, and frequently jointed horny skeleton, *a*; and is fed by the activity of the tentacula, *d*, and by the digestive powers of

the alimentary sacs (g) of a hundred polypi, the common produce of which circulates through the tubular cavities for the benefit of the whole community. The soft integument of the nutrient polypes (d, e, g) contains the thread-cells, to which

Fig. 2.—*Campanularia dichotoma*, magnified.

allusion has previously been made. These are protruded when the skin is irritated, and give the tentacles the appearance of being beset by minute bristles. The digestive sac of each polype is lined by a ciliated epithelium; but there is a perforation at the base communicating with the central tube, f. This outlet admits only of the passage of the fluid contents of the stomach, undigested matters being ejected by the mouth. There is reason to believe that sea-water enters the branches of the tube f, and circulates, by means of the ciliated epithelium, through the compound organism; and by this means contributes to the respiratory process. 'At certain points of these ramified polypes,' says Professor Owen, 'which points are constant in and characteristic of each species, there are developed little elegant vase-shaped or pod-shaped sacs, which are called the ovigerous vesicles, or *ovicapsules*. These are sometimes appended to the branches, sometimes to the axillæ, as at h, i, k (in fig. 2). They are at first soft, and have a still softer lining membrane, which is thicker and more condensed at the bottom of the vesicle. It is at this part that the ova or germs are developed, and for some time these are kept in connection with the vital tissue of the polype by a kind of umbilical cord. In all the compound *Hydrozoa*, the ovicapsules are deciduous; and having performed their functions in relation to the development of the new progeny, drop off like the seed-capsules of plants.' On other individuals of the same species, sperm-capsules are developed, which, in form, resemble the ovicapsules, but in place of ova, contain spermatozoa. The act of fertilisation in most cases occurs by diffusion of the spermatozoa in the surrounding water. There is much that still requires elucidation in reference to the various modes of reproduction of this class. Many of the *Hydrozoa* have been shewn to be merely larval forms of *Medusæ*. See GENERATIONS, ALTERNATION OF.

The leading anatomical distinction between the *Actinozoa*, or *Actinozoa*, and the *Hydrozoa* has been already noticed. The common *Actinia* (q. v.) may be regarded as the type of this class, all of which

are marine, and principally inhabit the warmer or tropical seas. Many of the larger tropical polypes of this class combine with a structure similar to that of the *Actinia* an internal calcareous axis or skeleton, which, penetrating into the interior of the organism, presents the lamellated and radiate structure recognisable in the *Fungia*, and in the skeletons of *Caryophylla*, *Madrepore*, &c. Such *Anthozoa* are termed coralligenous; and every hard structure deposited in or by the tissues of this class, and forming a uniform framework, is recognised by zoologists as a coral. Like the members of the preceding class, many of the *Anthozoa* multiply freely by gemmation, complex or compound animals or colonies of animals being formed, in which individual polypes are united by a *cenosarc* or *polypidom*. For a description of the mode in which communication takes place between the common body or mass and the individual polypes, we must refer to the article *ALCYONIUM*. Various arrangements of this class have been proposed by zoologists. If we exclude the consideration of fossil genera, we may divide the *Anthozoa* into two orders—the *Alcyonaria* and the *Zoantharia*.

The *Alcyonaria* may be characterised as *Anthozoa* in which each polype is furnished with eight tentacles, not simple, as in *Actinia*, but furnished with pinnate margins, with eight somatic chambers, and eight mesenteries. With the exception of one genus, they are all composite in structure; their polypes being connected with one another by a *cenosarc*, which is traversed by prolongations of the somatic cavity of each polype, a system of canals being thus formed whose parts freely communicate and are readily distensible. Carus, in the *Handbuch der Zoologie*, 1863, vol. 2 (of which he is joint author with Peters and Gerstaecker), mainly adopting Milne-Edwards's arrangement, divides the *Alcyonaria* into the three following families: 1. *Alcyonidæ*; 2. *Gorgonidæ*; 3. *Pennatulidæ*. In the

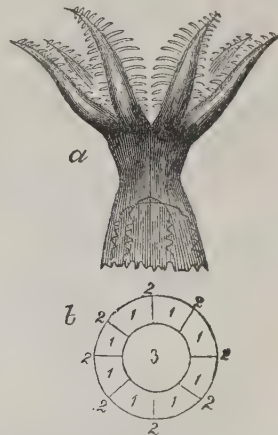

Fig. 3.—Diagram illustrating the Morphology of *Anthozoa*.

a, polype of *Alcyonium*; b, ideal section of the same; 1, 1, 1, &c., the somatic cavity, divided by the mesenteries, 2, 2, 2, &c., into eight chambers; 3, the digestive cavity.

Alcyonidæ, he includes the beautiful organ-pipe corals, of which Green and others make a separate family. The polypidom constructed by *Tubipora musica* consists of successive stages of cylindrical tubes of a rich crimson colour, united at various heights by means of horizontal connecting plates. The tubes placed upon the upper stage are alone

inhabited by living polypes, of a violet or green colour, the occupants of those below having successively perished as fresh generations appeared

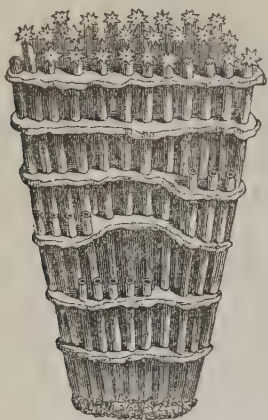

Fig. 4.—*Tubipora musica*.

above them. As an example of the *Gorgonidae*, we may take *Isis hippuris*, in which the skeleton is made up of alternate joints of calcareous and horny

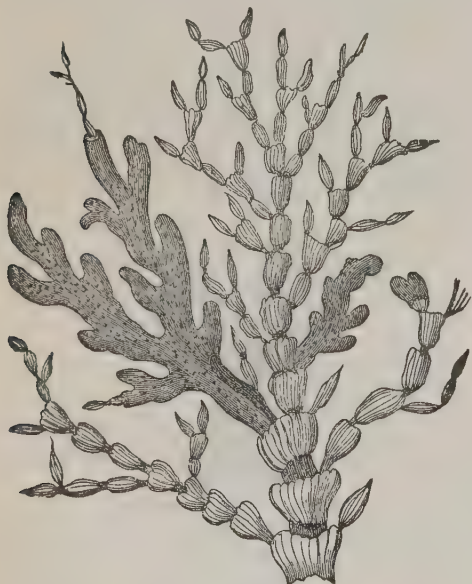

Fig. 5.—*Isis hippuris*.

matter, with the view of giving the necessary flexibility. In the *Pennatulidae*, the polypidum is free, and no polypes are attached to its basal portion. The *Sea-pens* (*Pennatula*) of our own coast afford a good example of this family. See *PENNATULA* for description and figure.

The *Zoantharia* may be characterised as *Anthozoa* in which the tentacles are either simple or branched, in general numerous, and together with the mesenteries, disposed in multiples of five or six. They may be arranged in the three following sub-orders—1. *Z. Malacodermata*; 2. *Z. Sclerobasica* or *Antipatharia* (Milne-Edwards); and 3. *Z. Scleroderma* or *Madrepores*. The first sub-order has been variously subdivided into families and sub-

families, which it is unnecessary to notice. It contains all the sea-anemones and animals allied to them, including the genera *Actinia*, *Anthea*, *Corynactis*, *Capnea*, *Adamsia*, *Ilyanthus*, *Sagartia*, *Bunodes*, *Edwardsia*, *Peachia*, &c.; and the *Zoanthidae*, which are aggregated polypes arising from a common creeping root-like fleshy band, and of which at least one species, *Zoanthus Couchii*, is an inhabitant of the British seas. All the members of the second sub-order are composite structures. *Antipathes*, the type of the group, presents a stem-like, simple, or branching cenosarc, which in one species tapers to a length of more than nine feet, with a diameter, at the base, not exceeding three-tenths of an inch. The third sub-order (the *Madrepores*) is a very extensive one. It is divided into the *Madrepora* *aporosa* and *M. perforata*, according as the coral exhibits a solid or a porous structure. *M. aporosa* may be arranged in the following families—1. *Turbinolidae* (including the sub-families *Caryophyllinae* and *Turbinolineae*); 2. *Oculinidae*; 3. *Astræidae*; 4. *Echinoporinae*; 5. *Merulinaceae*; 6. *Fungidae*: while the *M. perforata* are divided into (1) *Madreporidae* and (2) *Poritidae*. A few of the commoner forms of *Madrepora* are delineated in the articles *CORAL*, and *MADREPORE*. Amongst the most important works on this department of zoology may be mentioned Dana's *Structure and Classification of Zoophytes* (Philadelphia, 1846), and his *Report on Zoophytes*, and *Atlas of Zoophytes* (U.S. Exploring Expedition, 1849; Johnston's *British Zoophytes*, in 2 vols., to which we are indebted for many of our illustrations; Milne-Edwards and Haime, *Histoire Naturelle des Coralliaires ou Polypes proprement dits* (3 vols., 1857—1860); and Lacaze-Duthiers, *Histoire Naturelle du Corail, Organisation, Reproduction, &c.* (1864).

POLYPODIUM, a genus of Ferns, with spore-cases on the back of the frond, distinct, ring-shaped, in roundish *sori*, destitute of *indusium*. Several species, differing very considerably in appearance, are natives of Britain, where no fern is more common than *P. vulgare*. It grows on rocks, trees, dry banks, &c., and has fronds 2—18 inches long, deeply pinnatifid, with large *sori*.—*P. Dryopteris*.

Polypodium:

1, *P. dryopteris*; 2, *P. vulgare*.

with delicate ternate bipinnate fronds, is found in many dry stony places in the northern United States.—*P. Calaguala* a native of Peru, is said to possess

important medicinal properties—solvent, deobstruent, sudorific, &c.

POLYPO'RUS. See **AMADOU** and **DRY ROT**.

POLYPTERUS, a genus of fishes belonging to the order *Crossopterygia*, which is characterised by the presence of homologues of ordinary limb bones in the axial parts of the fins. The genus was constituted by Müller and others into a family, *Polypteridae*, of the discarded order of Ganoid Fishes. The shape is round and elongated; the head defended by large bony plates, the body covered with large and strong ganoid scales, which are very closely affixed to the skin. These curious fishes, existing remains of a type which was prevalent in former geologic periods, inhabit the rivers of Africa, and lodge in the soft mud. Their flesh is very pleasant. The P. of the Nile, called *Bichir* by the Egyptians, is said to be one of the finest fishes of that river. It is about 18 inches long.

POLYPUS, in Surgery, is an antiquated term employed to signify any sort of pedunculated tumour attached to a surface to which it was supposed to adhere like a many-footed animal, as its name indicates. The most common seat of polypus is the mucous membrane, especially that of the nostrils and uterus; but these tumours are also found in the rectum, the larynx, and the external auditory passage of the ear. The only satisfactory mode of treatment consists in their removal, which must be effected in various ways, according to their position, as by the forceps, the *ecraseur*, the ligature, &c.

POLYSTYLE, a term applied to a building with a number of columns, but not the strict number of any of the classic arrangements.

POLYTECHNIQUE (*ÉCOLE POLYTECHNIQUE*), or **POLYTECHNIC SCHOOL** (Gr. *polys*, many; *technē*, art), was first established in Paris (1794) by the National Convention, under the name of *Ecole des Travaux publics* (School of Public Works). No students were admitted but those who intended to enter the public service; and though the general object of the institution was the supplying of well-educated youths to all branches, it was more particularly devoted to the thorough instruction of recruits for the corps of civil and military engineers. The institution received the name of 'Ecole Polytechnique' in 1795. The pupils were at first 349 in number, and each received, during his stay of two years in the institution, an annual stipend of 1200 francs (£48 nearly); the teachers were in most cases the most eminent savans of France—Lagrange, Prony, Monge, Hachette, Say, Vauquelin, Berthollet, Pelletier, &c., being among the number of the professors at the commencement. There was also in connection with the school a periodical called the *Journal Polytechnique*, valuable for its excellent memoirs of the professors and the more eminent pupils. In 1799, some modifications were introduced into the working of the school; the number of pupils was at the same time limited to 200, and they were put into uniform. The advantages of an institution of this sort, when ably conducted, soon made themselves evident, and the P., in consequence, rose into high estimation, not only in France, but throughout Europe, so much so, that it became common for foreign nations, when entering into a treaty with France, to stipulate for the admission of a certain number of their subjects into the institution, after passing the prescribed entrance examination. In 1804, the Emperor Napoleon introduced various modifications into its working, and gave it a military organisation; it was also removed from the Palais-Bourbon (where it had existed from its first establishment) to the old college of Navarre. One

of the new regulations was the obligation imposed upon each pupil of paying a sum of 800 francs (£32) to the institution, and also providing himself, at his own expense, with all the necessary books and instruments; but, at the same time, great liberality was shewn to deserving applicants who could not conform to this regulation; and some years later, an annual grant of 30,000 francs was made by government for their benefit, and for pensions to old pupils. The number of teachers was also increased, and all the pupils were regularly drilled, especially in the use of fire-arms and the working of heavy ordnance. The institution became more and more, as the end of the Napoleonic empire drew near, a training-school for young artilleryists and engineers; and such was the enthusiasm of the pupils in the Emperor's cause, that, after the disasters of 1814, they demanded to be enrolled *en masse* in the ranks of the French army. However, Napoleon was (to use his own words) not inclined 'to kill the hen for the golden eggs;' but he allowed them to form three out of the twelve companies of which the artillery corps of the national guard was composed. These three companies rendered important service in manning the walls of Paris, and behaved heroically in the battle of March 30, 1814. After the first Restoration, the P. being considered to be evil-disposed to the government, suffered considerable reductions; but was restored to its former importance for the brief period of the 'Hundred Days.' After the second Restoration (July 1815), the staff of professors was remodelled; Lacroix and some others were dismissed, and replaced by Poisson, Arago, Cauchy, &c. Notwithstanding these changes, the government still had its doubts as to the loyalty of the establishment, and took advantage of an outbreak, April 3, 1816, to break it up. It was reconstituted in September of the same year, under a revised code of regulations, and in 1822, the old severity of military discipline was restored. Since this time, it has preserved its loyalty to the government, and the pupils have taken an active part in the various revolutions in Paris. Its constitution, which has so frequently suffered change, was finally amended, November 1, 1852. The rules now are—1. No pupil can be admitted unless he has been successful in the public competitive examination which is held each year, the subjects and date of the examination being previously published by a decree of the Minister of War. 2. The conditions of admission to the competitive examination are, that the candidate shall be a Frenchman; that he shall be more than 16, and less than 20 years of age, on the 1st of January of that year. 3. Regular soldiers are admitted up to the age of 25 years, provided they have been on real and effective service for two years. 4. The entrance-charge is 1000 francs (£40) per annum, and the cost of outfit (to be also paid by the pupil) is determined each year by the Minister of War. 5. The duration of the course of instruction is two years: the pupils, after finishing their course, must pass a final examination; the successful candidates, if found to be physically qualified, are arranged in order of merit, and choose in order what branch of the public service they wish to enter. 6. The branches of the public service which are recruited from the P. are, the corps of land and naval artillery, military and naval engineers, the imperial marine, the corps of hydrographic engineers, that of engineers of roads, bridges, and mines, the corps of staff-officers, the superintendence of telegraphs and tobacco manufactories.

The branches at present taught are, analysis (mathematical), mechanics and machines, fortification and the military art, descriptive geometry, geodesy, physics, chemistry, architecture, French

composition, the German language, drawing and designing (of plans, figures, and maps). The staff of instructors consists of 20 professors and masters, and 18 tutors.

Though its main object is the recruiting of the public service, yet from the P. have proceeded almost all the celebrated French mathematicians and philosophers of the last half-century.

POLYTHEISM. See GOD.

POLYZOA, known also as BRYOZOA (from the Greek *bryon*, moss, and *zoon*, an animal; because many of these organisms incrust other animals or bodies like moss) and CILIOBRACHIATA (from the circumstance that their tentacles are ciliated), are so called from many individuals being united into a colony or polyzoary. Dr Grant, in his *Observations on the Structure and Nature of Flustra*, in 1827, and Milne-Edwards and Andouin, in their *Résumé des Recherches sur les Animaux sans Vertèbres faites aux îles Chaussey*, in 1828, indubitably shewed that these animals more closely resembled, in the details of their organisation, the molluscs than the radiate subkingdom, with which they were formerly confounded.

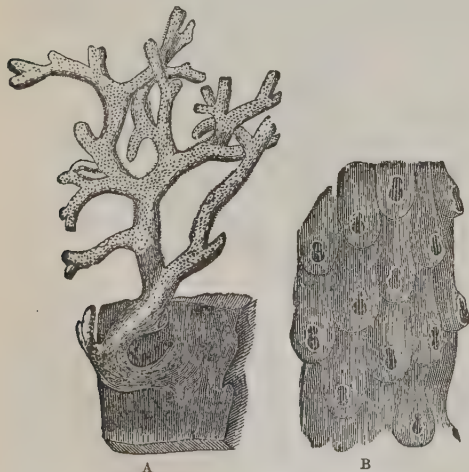

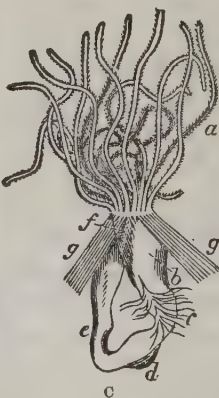

Most of the P. are microscopic, but as they occur in colonies, they often collectively form sufficiently conspicuous masses, and although there is little diversity in the form or structure of the animals themselves, there is much difference in the form, arrangement, and composition of the cells or chambers in which the individual animals reside. 'In general,' says Mr Gosse, 'the form of the cell is ovate or oblong; but the general shape is variously modified, being tubular, club-shaped, horn-shaped, cradle-shaped, square, &c.' The arrangement is often shrub-like, or the cells may be arranged in close series, either adhering in irregular patches, as the *Lepraliæ*, or rising into broad, flexible leaves, as the *Flustra*, or common sea-mats, or in solid strong walls, or coral-like masses, as the *Escharæ*, or calcareous sea-mats. Each animal lives freely in its cell, with whose walls it is connected only by means of muscular bands and threads at certain points,

altogether restricted within the latter; their movements being due partly to pressure upon the outer walls, and partly to the muscular bands, which act chiefly as retractors. On examining one of these organisms in the expanded state, the mouth is seen to be surrounded by a crown of tentacles, which are most commonly ten or twelve in number, and are clothed with vibratile cilia, which lash the water towards the mouth, and thus create numberless little whirlpools, by which nutritious matter is conducted into the oral aperture of the polyzoa. These ciliated tentacles, which are seen in C, *a*, in the figure, constitute one of the essential points of difference between these animals and the hydraform polypes, with which they were formerly associated. The mouth leads to a funnel-shaped cavity or pharynx, *b*, which is succeeded by an oesophagus, *c*, and a true digestive stomach, *d* (between which a muscular gizzard intervenes in certain genera), after which the intestine, *e*, turns back upon itself, and terminates in an anus, *f*, near the mouth. In the separate intestine and anal orifice, we have another characteristic distinguishing these animals from the polypes. At the base of the tentacular circle, just above the anal orifice, is a nervous ganglion, which in all the P. lies on the re-entering angle, between the two extremities of the intestinal canal. No heart has as yet been discovered, the matters which result from digestion percolating through the intestinal walls, and becoming mixed with the fluid in which the viscera float. According to Professor Allman, three distinct modes of reproduction occur in the P., viz., by buds or gemmæ, by true ova, and by free locomotive embryos. This subject, however, requires further investigation.

Many P. inhabit fresh waters. *Plumatella* is found in N. America and Europe, while *Umatella* and *Pectinatella* of Leidy are types of peculiarly American families. *P. magnifica* is a large species, with a globular gelatinous basis, nearly a foot in diameter.

Minute appendages, of a very remarkable character, are fixed to the cells of many of the genera. They are termed *Avicularia*, or 'Bird's-head Processes,' and *Vibracula*, or whip-like spines.

The *Avicularia* were described by Ellis, who first noticed them (in his *Essay towards a Natural History of the Corallines*, 1758), as resembling 'a bird's head with a crooked beak, opening very wide;' they consist of a fixed and a movable nipper, like a crab's claw, the latter being worked by special muscles. These moving beaks have been often observed to seize minute animals; but as these organs have no power of passing their prey to the mouth, the P. cannot receive nourishment from this source. Mr Gosse ingeniously suggests that 'the seizure of a passing animal, and the holding of it in the tenacious grasp until it dies, may be a means of attracting the proper prey to the vicinity of the mouth.' The

Eschara Cervicornis :

A, portion of its coralline fabric, of the natural size; B, portion of a young branch, enlarged, to shew the arrangement of the superficial apertures; C, an individual withdrawn from its cell and highly magnified; *a*, mouth; *b*, pharyngeal cavity; *c*, digestive stomach; *e*, the intestine; *f*, the anus; *g*, retractor muscles.

and by the covering of the mouth of the cell. The animal may either expand itself to a considerable extent out of the mouth of the cell, or it may be

vibracula consist of a long, slender movable seta or bristle, which, according to Gosse, serves 'to rid the animal of intruding vagrants, and to cleanse

away accidental defilement, by sweeping across the orifice of the cell.' Both these kinds of organs are of service in determining genera. Excellent magnified representations of the *Avicularia* and *Vibracula* may be seen on referring to figs. 13 and 11, in Mr Busk's excellent article, POLYZOA, in *The English Cyclopædia*, to which, as also to that gentleman's *Catalogue of Marine Polyzoa in the British Museum*, and to Professor Allman's 'Report on the Fresh-water Polyzoa,' published in the *Reports of the British Association* for 1850, the reader is referred for further information regarding this remarkable class of animals.

POMA'CEÆ, or POMEÆ, according to some botanists, a natural order of plants, but more generally regarded as a suborder of ROSACEÆ (q. v.). The plants of this order are all trees or shrubs, abundant in Europe, and chiefly belong to the temperate and colder regions of the Northern Hemisphere; they are rare in very warm climates, and are not found at all in the southern hemisphere. They have the botanical characters described in the article ROSACEÆ (q. v.), and in addition are distinguished by having the tube of the calyx more or less globose, the ovary fleshy and juicy, lined with a thin disc, its carpels adhering more or less to the sides of the calyx and to each other; the fruit a *Pome* (q. v.), 1—5-celled, in a few instances spuriously 10-celled; the ovules in pairs, collateral. Many of the species are prized for the beauty and fragrance of their flowers, some produce valuable timber; but the order is chiefly remarkable as producing a number of the very finest fruits of temperate climates. See APPLE, PEAR, QUINCE, MEDLAR, LOQUAT, HAWTHORN, CRATÆGUS, AMELANCHIER, ROWAN, SERVICE, PYRACANTHA.—There are about 200 known species.

POMA'DE, or POMATUM, is a preparation to be used instead of liquid oil for the hair. It consists of a fine inodorous fat, such as lard or suet; but neither of these is quite free from smell, and the most careful perfumers render them so by a peculiar process. They melt them in a steam-bath, and to every $\frac{1}{2}$ of cwt. add 1 oz. of alum and 2 ozs. of salt, continuing the action of the heat till any scum ceases to rise; the scum is carefully removed, and the fat allowed to cool, after which it is levigated with cold water with great care and patience until every particle has been acted upon, and the salt, alum, and albuminous matters are perfectly washed out, after which it is remelted in the steam-bath, and any remaining water falls to the bottom: when cold, it is fit for use. The perfumer then takes portions of this prepared fat, and remelting each separately, adds a little wax or spermaceti to give it consistency, and perfumes it with some essence. The varieties of pomades are as numerous as the perfumed essences. Anciently, they were made by boiling over-ripe apples in fat, by which the peculiar smell of the fruit was communicated, and this originated the name, which is derived from *pomum*, an apple.

POMBAL, DOM SEBASTIAO JOZE DE CARVALHO, MARQUIS OF, the greatest of all Portuguese statesmen, and one of the ablest men of his time, was born 13th May, 1699, at the castle of Soura, near Coimbra. His father, Manuel de Carvalho, was a captain of cavalry, and belonged to the second grade of nobility. After studying law at Coimbra, and serving a short time in the army, P. was banished from Lisbon on account of his youthful turbulence of disposition, and retired to his birthplace, where he devoted himself for a while to study. Subsequently, he married a rich widow, Donna Teresa da Noronha Almada, and repaired to court. In 1739,

he was appointed envoy-extraordinary to the court of London through the influence of his uncle, Paulo Carvalho, a position which he held for six years, after which he was sent to Vienna in a similar capacity. Here P. (whose first wife was now dead) espoused, in 1749, Leonora Ernestina, Countess Daun, niece of the famous Austrian marshal of that name. This marriage had a most felicitous influence on his future career. When P. returned to Portugal, the Portuguese queen, who was an Austrian princess, conceived a great attachment to his wife; and when her son, Joseph I., ascended the throne in 1750, she induced him to appoint P. state secretary for foreign affairs. Immediately, his splendid administrative genius burst forth like a sudden blaze of sunshine. He found his country almost without an army, without a fleet, without commerce or agriculture, and all power in the hands of unscrupulous Jesuits and grasping nobles. Among his first acts was to re-attach to the crown a great number of domains that had been unjustly alienated. Then followed the re-organisation of the army, the introduction of fresh colonists into the Portuguese settlements, the establishment of an East Indian Company, and another for Brazil, where he introduced the cultivation of coffee, sugar, cotton, rice, indigo, and cocoa. In virtue of a treaty with Spain, signed in 1753, Paraguay became an appanage of the Portuguese crown, and it was in this remote region that P. first came into collision with the Jesuits—the founders of the Paraguay missions. He got his brother, Francisco-Xavier de Mendonça, appointed captain-general of Paraguay, and is said to have given him secret instructions to ruin the Jesuits in his reports to the king. When the great earthquake happened at Lisbon in 1755, P. displayed an almost superhuman courage and energy, in consequence of which the king raised him to the rank of Count of Oeyras, and in the following year appointed him prime minister. He crushed a revolt instigated by the great nobles and the Jesuits, the latter of whom he now removed from the person of the sovereign, deprived of the power of the confessional, and in 1757 confined to their colleges. A conspiracy against the life of the king, which broke out 3d September 1758, but failed, placed his enemies completely in his power. The leaders were punished with appalling severity. The Duke of Aveiro and the Marquis of Tavora were broken alive on the wheel, the sons and the son-in-law of the former were strangled, and the wife of the marquis was beheaded. The Jesuits were suspected of complicity in the plot, and P. accused them to the pope; and when the latter would not allow the minister to proceed against them in the civil courts, he daringly caused some to be executed in prison. Father Malagrida, who had prophesied the death of the king, was delivered over to the Inquisition as a heretic, and condemned to be burned alive; and this *auto da fé* actually took place in 1761! But P. was not satisfied. He had made up his mind that the very presence of the Jesuits in Portugal was incompatible with the security of the government and the welfare of the nation, and by a royal decree of 3d September 1759, they were banished from the kingdom as rebels and enemies to the king. When they refused to leave, P. had them violently removed by soldiers, carried on board ships, and transported to the States of the Church. The pope, Clement XIII., vehemently protested, whereupon P. caused the papal nuncio to be shewn across the frontier. Shortly after, Clement XIII. died, and was succeeded in the papal see by Clement XIV.—no friend of the Jesuits, in consequence of which the differences between Portugal and the Vatican were soon made up. All this

time P. was labouring energetically to improve the cultivation of the land and the system of education. In 1770, he was created Marquis of P., and from this period to the death of the king in 1777, he was at the very height of his greatness. The accession of Joseph's daughter, Maria I.—an enemy of the minister—was immediately marked by his downfall. He was deprived of his offices; the conspirators whom he kept in prison were released; many of his institutions were abolished; and he himself was only saved from the scaffold because he held in his possession documentary proofs of the former treason of his now triumphant enemies. Maria ordered him to retire to his castle of Pombal, where he died, 8th May 1782. The peasantry always spoke of him as 'The Great Marquis,' and history has stamped the rustic verdict with its approval. When he was turned out of office, he left the queen a public purse containing 78,000,000 cruzados, and a well-ordered and flourishing state.

POME (Lat. *pomum*, an apple), a form of fruit of which examples are found in the apple, pear, and other fruits of the *Pomaceæ*; and in which the *epicarp* and *mesocarp* (see **FRUIT**) form a thick fleshy mass; whilst the *endocarp* is scaly, horny, or stony, and divided into separate cells, in which the seeds are enclosed. The fruit is crowned with remains of the calycine segments. Pomes have 1—5 cells, or spuriously 10 cells.

POMEGRANATE (*Punica granatum*), a fruit much cultivated in warm countries, and apparently a native of the warmer temperate parts of Asia, perhaps also of the north of Africa. It has been cultivated in Asia from the most ancient times, and is frequently mentioned in the Old Testament. It has long been naturalised in the south of Europe. In a wild state, the plant is a thorny bush, in cultivation it is a low tree, with twiggy branches, flowers at the extremities of the branches, the calyx red, the petals scarlet. It is generally referred to the natural order *Myrtaceæ*. The calyx is leathery, tubular, 5—7-cleft; there are 5—7 crumpled petals;

Section of a Pomegranate.

the fruit is as large as a large orange, with a thick leathery rind of a fine golden yellow, with a rosy tinge on one side, not bursting when ripe; the cells filled with numerous seeds, each of which is surrounded with pulp, and separately enclosed in a thin membrane, so that the P. appears to be formed of a great number of reddish berries packed together and compressed into irregular angular forms. The pulp is sweet, sometimes subacid, and of a pleasant delicate flavour, very cooling, and particularly grateful in warm climates. It is often used for the preparation of cooling drinks. A kind of P. without seeds is cultivated and much prized in India and Persia. Pomegranates have long been imported in small quantities into Britain from

Portugal and the north of Africa; but have never become an article of general demand and commercial importance like oranges. There is an ornamental variety of the P. with double flowers. The rind of the fruit is very astringent, and a decoction is used as a gargle in relaxed sore throat, and as a medicine in diarrhoea, dysentery, &c. Deriving its astringency from tannin, it is used to tan leather. The finest Morocco leather is said to be tanned with it, and small quantities are imported into Britain from the north of Africa for the preparation of the finest kinds of leather, under the name of *Pomegranate Bark*.—The bark of the roots is used as an anthelmintic, and is often successfully administered in cases of tape-worm. Its value was known to the ancients, and it has long been in use in India.—The P. tree is occasionally cultivated in hothouses or greenhouses in Britain. It bears the winters of the south of England in the open air, and is very ornamental, but the fruit is worthless. In some parts of the south of Europe it is used as a hedge-plant.

POMEL, a boss or ball used as an ornament on the top of pointed roof, turret, &c.

POMERANIA (Ger. *Pommern*), a province of Prussia, bounded N. by the Baltic, E. by West Prussia, S. by Brandenburg, and W. by the Mecklenburg duchies. Area, 12,111 square miles. Pop. (at the close of 1880) 1,540,034. P. is divided into the three governmental districts of Stettin, Stralsund, and Cöslin.

This province, which is one of the lowest and flattest in Germany, and has few hills of even moderate height, is intersected by the Oder (q. v.), which forms numerous lakes and ponds, the largest of which is the Dammer Lake. The waters of this lake and of the Oder are then carried into the Stettiner Haff, from which three outlets—those of the Peene, Swine, and Dievenow—lead into the Baltic. Between these three outlets are the two islands of Usedom and Wollin. After the Oder, the chief rivers of P. are the Ihna, Rega, Persante, Wipper, and Stolpe. The shores in some parts are protected by dikes and sand-banks. The soil is generally sandy, and in many districts even stony, although near Pyritz and Stargard, on the Ploen and Maduc Lakes, and at some points of the sea-coast, it presents a tolerably fruitful character, yielding good crops of wheat, and affording rich pasture. About half of the whole area is cultivated; about a sixth is uncultivated, or under water; and the remainder is in pastures, heath, and wood. The chief vegetable products, most of which are grown in sufficient quantities to be largely exported, are—rye, wheat and other grain, flax, hemp, tobacco, and timber. Among the other exports of P. are horses, cattle, sheep, swine, geese of superior quality, feathers, butter, wool, hams, sausages, smoked poultry, &c. The sturgeon and salmon fisheries are very productive, and P. is noted for its admirable lampreys, eels, and crayfish, which are largely exported in a pickled state. The mineral products, which are inconsiderable, include bog-iron, lime, marl, alum, salt, amber found on the coast near Stolpe, and peat—which latter substance is obtained in enormous quantities, and extensively used for fuel, notwithstanding the abundant supply of wood yielded by the extensive and productive forests.

Linen and woollen fabrics, and leather, rank among the best of the industrial products; but the manufactures of P. are not of much importance. The principal branches of industry are agriculture and the rearing of horses and cattle, while the active transport-trade between the neighbouring

Prussian states and the Baltic ports constitutes a very important source of wealth to the province. The main seat of Pomeranian trade is at Stettin (q. v.), which ranks as one of the most important commercial cities of Prussia.

P., like every other part of the Prussian dominions, is well provided with educational institutions, and, besides the university at Greifswald, it has eight gymnasia, several normal and training schools, and numerous classical and other schools.

P. formed, in the earliest periods of its history, a part of the ancient kingdom of the Wends or Vandals. From the year 1062 it had its own ducal rulers, and in the beginning of the 12th c. it adopted Christianity in consequence of the preaching of Bishop Otto of Bamberg. Bogislaus XIV., who died in 1637, was the last male representative of the Wendish ducal line; and, on his death, the House of Brandenburg laid claim to the whole of the Pomeranian territories, in conformity with a compact which the latter family asserted to have been made between them and the Wendish dukes; but the country having been occupied by the Swedes during the Thirty Years' War, Prussia was obliged to content itself with the possession of Further P., or *Hinterpommern*, which was assigned to it at the Peace of Westphalia, while Sweden retained the remainder of P., with the island of Rugen (q. v.). After the death of Charles XII., and the subsequent decline of the Swedish power, Prussia was able to make good her asserted claims on the territory of P. at the Peace of Stockholm; and in 1720 Sweden was compelled to cede Southern P. and the island of Rugen, retaining only a narrow strip of land between Mecklenburg and the Baltic, which was also incorporated with Prussia in 1815, after having been first transferred by Sweden to Denmark as part indemnification for the separation from the latter kingdom of Norway, and subsequently ceded to Prussia by the Danes in exchange for the duchy of Lauenburg, and on the payment of 2½ million thalers to the latter, and of 3½ million thalers to the Swedish government.

POMMETTÉE, or **POMEL CROSS**, in Heraldry, a cross whose extremities terminate in single knobs or pomels, like the *Bourdon* or pilgrim's staff.

Pommettée Cross. extent in Great Britain and America, to designate the study of fruits and of their cultivation, particularly those of the natural order *Pomaceæ* (q. v.). See **FRUIT**, **FRUIT-GARDEN**, **APPLE**, **PEAR**, &c.

POMO'NA (whose name is obviously connected with *pomum*, 'a fruit') was, among the Latins, the patron divinity of garden-produce. The poets, not, perhaps, without some allegorical design, represent several of the rural gods as her lovers—*Silvanus*, *Picus*, *Vertumnus*, &c. Of *Vertumnus*, in particular, it is related that after he had vainly tried to approach her under a thousand different forms, he at last succeeded by assuming the figure of an old woman. In this guise, he recounted to her the lamentable histories of women who had despised love, and having touched her heart, suddenly transformed himself into a blooming youth and married her. But *Vertumnus* (connected with *verto*, 'to turn,' or 'to transform') is probably nothing more than a personification of those changes by which plants advance from blossom to fruit. The worship of P.,

as was natural among a homely race of farmers and shepherds like the ancient Latins, was of considerable importance. Varro tells us that at Rome her services were under the care of a special priest, the *flamen Pomonalis*. In works of art she was generally represented with fruits in her lap, or in a basket, with a garland of fruits in her hair, and a pruning-knife in her right hand.

POMONA, or **MAINLAND**, much the largest and most populous of the Orkney Islands (q. v.), in which group it occupies a central position. It is open to the Atlantic on the west, and to the German Ocean on the east, while on the north Enghallow and Shapinsha Sounds separate it from the islands of Ronsay and Shapinsha, and on the south, Scapa Flow separates it from Hoy and South Ronaldsha. Area, 150 square miles; pop. (1871) 16,541. It is 25 miles in length, and 15 miles in extreme breadth, but is very irregular in shape. At the town of Kirkwall, the breadth of the island is only about two miles. In the west, the shores are bold and elevated, but there is a general slope towards the east. The surface is diversified with hill and lake, and consists in great part of moor and heath. Good pastures are found, however, and in the valleys there is a fertile, loamy soil. Oats, beans, and here are produced, and sheep and swine are extensively reared. The chief towns are Kirkwall (q. v.) and Stromness (q. v.).

POMPADOUR (*JEANNE ANTOINETTE Poisson*), **MARQUISE DE**, a notable mistress of Louis XV., was born in Paris in 1720 or 1722. Her reputed father was a certain François Poisson, who held a humble office in the army-commissariat; but M. le Normand de Tournheim, a rich *fermier-général*, claimed for himself the honours of a dubious paternity, and brought up the little Jeanne as his daughter. She turned out a wonderfully clever child, and M. le Normand spared no pains to give her the best, or, at least, the most stylish education possible. She excelled in such accomplishments as music, elocution, and drawing; but what charmed the brilliant society that frequented the *salons* of the rich financier, was the perfect grace and beauty of her figure, and the exquisite art with which she dressed. A crowd of suitors constantly besieged her, but the one who obtained her hand was her cousin, Le Normay l'Etiolles. They were married in 1741. But Madame l'Etiolles, who was constantly told by her infamous mother that she was a 'morsel for a king,' was careless of her husband's honour and peace. Though he loved her to distraction—and he was a man with whose love any woman might have been content—she, cold, heartless, and ambitious, was scheming day and night to attract the notice of the monarch. Her efforts were after a time crowned with success, and Madame d'Etiolles was installed in the palace of Versailles; she was soon afterwards ennobled by the title of Marquise de P., and long ruled the king, first as mistress, and afterwards as *amie nécessaire*. One reads with some astonishment of the incessant artifices she had recourse to in order to preserve her influence—the everlasting huntings, concerts, private theatricals, little suppers, and what not—anything to distract the royal mind (surely sufficiently distracted already by nature), and to make it think only of the clever purveyor of gaieties! The private theatricals, in particular, were a great success, and were 'got up' every winter from 1747 to 1753—the marquise herself proving a charming actress. The king thought the marquise extremely clever, and, when he ceased to 'love' her, was glad to avail himself of her services as his political adviser. In fact, she became premier of France; the council of ministers assembled

in her boudoir, where the most important affairs of state were settled. The choice of ministers, of ambassadors, of generals, depended on the caprice of a female; the Abbé de Bernis, the favourite of a favourite, entered the council. Foreign diplomacy turned the circumstance to account. The Austrian prime-minister induced Maria Theresa to sacrifice her pride to the exigencies of her position, and the empress-queen wrote the courtesan a letter in which she addressed her as *ma cousine*. That word turned the head of the marquise, and changed for a time the foreign policy of France. She died (15th April 1764) with the reins of government in her hands. During her life-time, immense sums from the national treasury were paid away to the marquise, and to her brother, created Marquis de Marigny. In the years 1762—1763 alone, they amounted to 3,456,000 livres. She had numerous houses and lands also given her. In 1853, M. le Roi, keeper of the town-library of Versailles, published in the *Journal de l'Instruction Publique*, a list of the expenses of the Marquise de P. during the years in which she had enjoyed the royal favour, which he had found in MS. in the archives of the department of Seine-et-Oise. They amounted to 36,000,000 livres. She was imperious and vindictive beyond measure, and with relentless cruelty doomed to perpetual imprisonment, in the dungeons of the Bastille and elsewhere, multitudes who had dared to speak about her ill-gotten gains and power. After facts like these, it is but a poor apology for the marquise to say that she encouraged savans, poets, and philosophers, patronised and protected the *Encyclopédie*, and aided in the expulsion of the Jesuits. The *Mémoires* and *Lettres* published under her name are spurious.

POMPEII, a city of Campania, was built at the mouth of the river Sarnus (*Sarno*), looking out on the Bay of Naples. It stood at the base of Mount Vesuvius, between Herculaneum and Stabia. Of its early history little is known (legend ascribed its foundation to Hercules); but in more recent times it became a favourite resort for wealthy Romans, many of whom, including Cicero, had villas in the suburbs. It must have been at one time a place of considerable trade, since it was the port-town of Nola and other inland cities which studded the fertile valley of the Sarnus. The city was much damaged by an earthquake which happened on the 5th February 63 A.D., and not many years had revolved when the great and final calamity overtook it. In 79 A.D. occurred that terrific eruption of Vesuvius which, in one day, overwhelmed in irremediable ruin the towns of P., Herculaneum, and Stabia. In course of time a small village rose at or near the spot; but by and by the memory of P. was forgotten, and for centuries its very site was unknown. The difficulty of discovering its true position was increased in consequence of the changes produced by this fearful convulsion, which had hurled back the Sarnus from his ancient course, and raised the sea-beach to a considerable height, so that the re-discovered city, to which merchantmen resorted of old, is now a mile from the coast, and a considerable distance from the stream that in ancient times was wont to skirt its walls. For more than sixteen hundred years, P. lay undisturbed beneath heaps of ashes and cinders. At length, in 1689, some ruins were noticed, but it was not till 1755 that any excavations were made. These operations, begun by the Neapolitan government, have been continued till the present time (and recently with increased energy), and have been exceedingly productive of objects which interest the antiquarian and the classical scholar. The remains found are in a remarkably

good state of preservation, owing to the fact that the city was destroyed not by lava, but by showers of sand, ashes, and cinders (*lapilli*), forming a light covering, which found its way into every nook, and, as it were, hermetically sealed up the town. It would appear that in some parts at least the matter was deposited in a liquid state, and so flowed into the remotest cellars of the doomed habitations. The immense volumes of water which poured down, mixed with the ashes that had already fallen and with those that were still suspended in the air, and formed a kind of liquid mud. This is proved by the discovery of the skeleton of a woman in a cellar, 'enclosed in a mould of volcanic paste, which received and has retained a perfect impression of her form.' The depth of the superincumbent rubbish is in most places about 15 feet, but this mass has not been heaped up at one eruption. That it is the work of many eruptions is proved by the facts: (1) That as many as eight or nine different layers have been distinctly counted; and (2) That, while the upper layers are undisturbed, the lower one has evidently been moved. Comparatively few skeletons have been found, and almost no objects of great intrinsic value, such as gold and silver plate, which seems to shew that the great body of the population had found time to escape, and had returned to seek and to bury their lost friends, and to recover whatever treasures could be found. In the autumn of 1864, in excavating a temple of Juno, upwards of two hundred skeletons were found lying on the floor, the victims having evidently gone thither to seek the protection of the goddess. The plan of P. seems to have been regular, the streets (the broadest of which yet discovered is only 30 feet) crossing one another at right angles. The houses were plain and low, being seldom more than two stories high, and had all their good apartments on the ground-floor. The city was about two miles in circumference, and was surrounded by a wall. It would be impossible in our brief space to attempt even an enumeration of the objects discovered in this now famous city, or to detail the valuable results which have flowed from the work of excavation. Suffice it to say that in all the departments of social life—in the affairs of domestic and of public life, of the worship of the gods, and the shows of the arena—in architecture, painting, and sculpture—in fine, in all the appliances of comfort and of luxury in a wealthy community, we have, as it were, a living picture of a city 1800 years ago. The reader who wishes fuller information should consult Mazois' work, *Les Ruines de Pompeii* (Paris, 1812—1838); Breton's *Pompeia* (Paris, 1855); Overbeek's work (Leipzig, 1856); Sir W. Gell's well-known *Pompeiana* (4 vols. 1824—1830); and *Pompeii* (2 vols. 1831) in the series of the Society for the Diffusion of Useful Knowledge. For a popular account of the present state of P., we may refer to *The Wonders of Pompeii*, by M. Monnier, N. York, 1870.

POMPELMOOSE, or POMELO (*Citrus pomelmoos*), a fruit nearly resembling the Shaddock (q. v.), of which, perhaps, it ought to be esteemed a variety, although it is now distinguished by some botanists as a separate species. It is large and pale yellow. It has long been cultivated in the East Indies, and has recently been introduced into many warm countries. It has become an article of importation into Britain, and is frequently to be seen in fruit-shops. In pleasantness of taste, it resembles the best oranges. It is often preserved with wine and sugar, when it is very agreeable and refreshing in a hot climate. The rind is often candied.

POMPEY THE GREAT. Cneius Pompeius

Magnus, son of Cn. Pompeius Strabo, was born in 106 B.C. At the early age of 17 he began to learn the military art under his father by service in the field against the Italians in the Social War. Though so young, he gave proof of extraordinary valour, and of remarkable energy of character. On the death of his father in 87 B.C., when he was only 19 years of age, he was left without a protector, and during the temporary triumph of the Marian party, he was for some time in considerable danger. When Sulla, to whose side he was attached, returned from Greece to Italy to oppose Marius, P. hastened into Picenum, where he had considerable estates and influence, and there raised an army of three legions, with which he successfully opposed the forces of the Marian party, compelling them to quit the district, and effecting a junction with Sulla. During the rest of the war he behaved with great prudence and valour, and with such remarkable success, that, on the restoration of peace in Italy, the conduct of the war against the remains of the Marian faction in Africa and Sicily was intrusted to him. He speedily performed his commission, and on his return to Rome was honoured with the name of MAGNUS (i.e., 'the Great'), and with a triumph, which, for one who had not yet held any public office, and was merely an *eques*, was an unprecedented distinction. His next exploits were the reduction of the followers of Lepidus, whom he drove out of Italy, and the extinction of the Marian party in Spain, led on by the brave Sertorius. This latter work was one of no small difficulty. P. suffered some severe defeats at the hands of Sertorius, and it was only after Sertorius had been assassinated that he was able to put an end to the war. In returning to Italy after an absence of five or six years in Spain, he fell in with and defeated the remnants of the army of Spartacus, and thus claimed the credit of concluding the Servile War. He was now the idol of the people, and though legally ineligible to the consulship, was elected to that important office for the year 70, the senate relieving him of his disabilities rather than provoke him to extremities. Hitherto P. had belonged to the aristocratic party, but as he had of late years been looked upon with suspicion by some of the leading men, he publicly espoused the people's cause. He carried a law restoring the tribunician power to the people; and aided largely in introducing the bill of Aurelius Cotta (*Lex Aurelia*), that the *judices* should for the future be taken from the *senate*, the *eques*, and the *tribuni aerarii*, instead of from the senate alone. In 67—66 B.C., P. performed a noble service to the republic in clearing the Mediterranean of the pirates who infested it in immense numbers; and during the next four years, 65—62, he conquered Mithridates, king of Pontus, Tigranes, king of Armenia, and Antiochus, king of Syria. At the same time he subdued the Jewish nation, and captured Jerusalem. On his return to Italy he disbanded his army, and entered Rome in triumph for the third time in 61 B.C. And now his star began to dim. Henceforward we find him distrusted by the aristocracy, and second to Cæsar in popular favour. After his return, he was anxious that his acts in Asia should be ratified by the senate, and certain lands apportioned among his veteran soldiers. But the senate declined to accede to his wish, and he therefore formed a close intimacy with Cæsar, who promised to secure for him the accomplishment of his objects, if he in turn would assist Cæsar in the attainment of his aims. Crassus, who possessed enormous wealth, and who in consequence exercised a wide influence at Rome, was induced to forego his grudge to P., and thus these three men formed among themselves that coalition which is commonly

called 'the First Triumvirate,' and which for a time frustrated all the efforts of the aristocratic party. This small oligarchy carried all before them; P.'s acts in Asia were ratified; Cæsar's designs were all gained; his agrarian law, distributing land in Campania among the poorer citizens was passed, and thus, too, P.'s promises to his troops were fulfilled. Cæsar's daughter, Julia, was given in marriage to P., and private relationship was thus made to bind tighter the tie of political interest. And now, for some years following, Cæsar was reaping laurels in Gaul, and rising higher in popular esteem as a warrior and statesman, while P. was idly wasting his time and his energies at Rome. But P. could not bear a rival. Jealousies sprang up; Julia died in 54 B.C., and thus father-in-law and son-in-law were sundered by a yet wider gulf, which no bridge could span. P. now returned to his former friends, the aristocracy, whose great desire was to check Cæsar's views, and strip him of his command. Cæsar was ordered to lay down his office and return to Rome, which he consented to do, provided P., who had an army near Rome, would do the same. The senate insisted on an unconditional resignation, and ordered him to disband his army by a certain day, otherwise he would be declared a public enemy. To this resolution two of the tribunes in vain objected; they therefore left the city and cast themselves on Cæsar for protection. It was on this memorable occasion that he crossed the Rubicon, and thus defied the senate and its armies, which were under P.'s command. The events of the civil war which followed have been recorded in the life of Cæsar (q.v.). It remains only to mention, that after being finally defeated at Pharsalia in 48 B.C., P. escaped to Egypt, where, according to the order of the king's ministers, he was treacherously murdered by a former centurion of his own, as he was landing from the boat. His head was cut off, and afterwards presented to Cæsar on his arrival in Egypt. But Cæsar was too magnanimous to delight in such a sight. The murderer of P. was, by his orders, put to death. The body lay on the beach for some time, but was at length buried by a freedman, Philippus, who had accompanied his master to the shore.

POMPEY'S PILLAR. The name of a celebrated column standing in the neighbourhood of Alexandria. It stands upon an eminence about 1800 feet south of the walls. It is a monolith of red granite, and of the Corinthian order, and stands upon a pedestal. Its total height is 98 feet 9 inches; shaft, 73 feet; 29 feet 8 inches in circumference. The shaft is well executed. On the summit is a circular depression for the base of a statue, which in some old drawings is represented standing on it. The name popularly applied to it of Pompey's pillar is an erroneous appellation given by ancient travellers, who confess they do not know whence it was derived, and still retained. The inscription on the base, however, shews that it was erected by Publius, prefect of Egypt, in honour of the Emperor Diocletian, who is styled upon it 'the invincible;' and it is supposed to record the conquest of Alexandria by Diocletian, 296 A.D., and the suppression of the rebellion of the pretender Achilleus. It appears to have been in the vicinity of a circus, forum, or gymnasium. The obelisk stood upon some fragments of Egyptian monuments of remote antiquity, consisting of a piece with the name of a monarch of the 13th Egyptian dynasty, and another with that of Psammithichus I., the former of which is now in the British Museum.—Wilkinson's *Modern Egypt*, I. p. 149 and foll.; White, *Ægyptiaca*, p. 1, and foll.; Champollion-Figeac, *L'Égypte*, p. 472; Norden, I. p. 22.

PONCE DE LEON, FRAY LUIS, a celebrated Spanish poet, was born in 1527, probably at Granada. In 1544 he entered the order of St Augustine at Salamanca, where he studied, took his degree in theology in 1560, and was appointed professor of the same in 1561. The reputation that he acquired as a learned commentator on the Bible induced some persons, who were envious of his success, to accuse him of having disregarded the prohibition of the church, inasmuch as, at the request of a friend, he made a new translation of the Song of Solomon, and brought out prominently, in his arrangement of the verses, the true character of the original—viz., that of a pastoral eclogue. This interpretation was not that adopted by the Catholic Church, and P. was summoned, in 1572, before the formidable tribunal of the Inquisition at Valladolid to answer the charges of Lutheranism, and of translating the sacred writings contrary to the decrees of the Council of Trent. The first accusation he quickly disposed of—for he had in reality no inclination to a foreign Protestantism; but the second was undoubtedly true, and P. was imprisoned. After five years he was released through the intervention of powerful friends, and was even reinstated in his chair at the university with the greatest marks of respect. The numerous auditory that assembled to witness the resumption of his lectures, were electrified when P. began with these simple words: 'As we observed in our last discourse'—thus sublimely ignoring the cause and the duration of his long absence from his lecture-room. In 1580, P. published a Latin commentary on the Song of Solomon, in which he explained the poem directly, symbolically, and mystically; and, therefore, as obscurely, says Mr Ticknor, 'as the most orthodox could wish.' P. lived 14 years after his restoration to liberty, but his terror of the Inquisition never quite left him, and he was very cautious in regard to what he gave to the world during his lifetime. He died in 1591. P.'s poetical reputation was wholly posthumous, for though his *De los Nombres de Christo* (on the Names of Christ), (Salamanca, 1583—1585), and *La Perfecta Casada* (The Perfect Wife), (Salamanca, 1583), are full of imagery, eloquence, and enthusiasm, yet they are in prose. His poetical remains were first published by Quededo at Madrid in 1631, under the title, *Obras Proprias, y Traducciones Latinas, Griegas y Italianas: con la Paraphrasi de Algunos Salmos y Capítulos de Job*, and have since been often reprinted. These consist of translations from Virgil's *Eclogues* and the *Georgics*; from the *Odes* of Horace, and other classical authors, and from the Psalms. His original poems are few, but they are considered among the most precious in the author's language, and have given P. a foremost place among the Spanish lyrists. According to Ticknor: 'Luis de León had the soul of a Hebrew, and his enthusiasm was almost always kindled by the reading of the Old Testament. Nevertheless, he preserved unaltered the national character. His best compositions are odes composed in the old Castilian versification, with a classic purity and a vigorous finish that Spanish poetry had never till then known, and to which it has with difficulty attained since.' See Nicolas Antonio, *Bibliotheca Hispana Nova*; Ticknor, *History of Spanish Literature*; and Villemain, *Essais sur la Poésie Lyrique*.

PONCHO, an important article of male attire in Chili. It consists of a piece of woollen cloth, 5—7 feet long, 3—4 feet broad, having in the middle a slit through which the wearer passes his head, so that the poncho rests upon the shoulders and hangs down before and behind. In the fashions of recent times, the poncho has been introduced in Europe.

PONDICHERRY, the chief of the French settlements in India, situated in the district of South Arcot, in the Madras Presidency. The other French establishments are Mahé in Malabar, Karikal (q. v.) in Tanjore, Yanum in Godaveri, and Chandernagore (q. v.) in Bengal. The extent of the united territories is given by M. Block at 188 square miles. P. is situated on the Coromandel Coast in 11° 56' of N. lat., and 79° 52' of E. long., and is 98 miles from Madras. The territory of P. is divided into three districts—Pondicherry, Vellenore, and Bahour—has an area of 107 square miles, and comprises 92 villages. The total population of the French establishments in India in 1840 was reckoned at 171,217; in 1872, it amounted to 266,308. The population of the town of P. is about 50,000, and the population of the district about 90,000. The governor of P. is the governor-general of the French possessions in India; his income is 40,000 francs a year. The salaries of the *chefs de service* of the other establishments are as follows: Chandernagore, 16,000 francs; Karikal, 10,000 francs; Yanum, 8000 francs; Mahé, 8000 francs per annum. The governor of P. has a council consisting of the *ordonnateur*, the *proviseur-général*, and the *contrôleur colonial*. The French army in India consists of two companies attached to the 1st marine regiment of infantry, consisting of 276 men, commanded by six European officers. The spinning of cotton and the fabrication of cotton-thread are the chief manufactures in the French establishments.

History.—The first settlement of the French in India was at Surat, in 1668. The chief of the French East India Company at that time was Carou. Subsequently, he took Trincomalee from the Dutch; but they were not long in repossessing themselves of it. Carou then turned to the Coromandel coast. In 1672, he took from the Dutch St Thomé, a Portuguese town (now a suburb of Madras); but two years later, the Dutch retook this place also. It was then that François Martin collected about 60 Frenchmen and settled them in P., which, in 1674, he had purchased, with the surrounding territory, from Giugee, who had the supervision of all Sivaje's conquests in the country. The Dutch took the town in 1693; but by the treaty of Ryswick it was restored to the French in 1697. Chandernagore was ceded to the French in 1683 by Aurungzebe. In 1727, they obtained the cession of Mahé; in 1739, they purchased Karikal from the king of Tanjore; and in 1752, Yanum was ceded to them. Dupleix was governor of P. when war broke out between France and England; and in 1746 La Bourdonnais took Madras. In 1748, Admiral Boscawen besieged P., but two months later, was compelled to raise the siege. In the same year occurred the peace of Aix la Chapelle; but it did not put an end to hostilities in India till some time later. In 1757, war recommenced. In 1758, Count de Lally became governor-general, and attacked the English settlement of Fort St David, which surrendered, and was totally destroyed. In 1761, Eyre Coote took Pondicherry. By the peace of Paris, P. was restored to the French in 1763 with reduced territory, and also Mahé, Karikal, and Chandernagore. P. was again taken by the English under Sir Hector Monro in 1778, and restored in 1783. In 1793, the English again repossessed themselves of it, but the treaty of Amiens in 1802 again restored it, but only till the following year. From this time it was held by the English till, by the treaties of 1814 and 1815, it was for the last time restored to France, reduced to the narrow limits assigned by the treaty of 1783.

Annexed is a statement exhibiting some particulars relative to such of the present French

possessions in India subordinate to *P.* as are not noticed separately in this work.

YANUM, in the Godaveri District, in 16° 43' N. lat., and 83° 11' 16" E. long., about 24 miles south of Rajahmundry. The area is about 13 square miles.

MAHÉ, in the Malabar District, in 10° 42' N. lat., and 75° 38' 16" E. long. The area is only about 2½ square miles.

PONDWEED (*Potamogeton*), a genus of plants of the natural order *Naiades*, having hermaphrodite flowers, sessile upon a spike or spadix, which issues from a sheathing bract or spathe, a perianth of four scales, four sessile anthers opposite to the scales of the perianth, four pistils, which become four small nuts, and a curved embryo. The species abound chiefly in the rivers, lakes, and ditches of the United States and Europe, but they are found

Pondweed:
a, expanded flower (magnified).

also in other parts of the world, and some of them in New Holland. They often present a beautiful appearance in clear streams and ponds, where they protect the spawn of fish and harbour aquatic insects, their seeds also affording food to aquatic birds. The roots are a favourite food of swans. Some of the species have the leaves all submersed, others have some of their leaves floating, and considerably different in form from the submersed leaves.

PO'NGO (*Simia* or *Pithecus Wormbi*), an ape of the same genus with the Orang (*q. v.*), but of much larger size, six feet or more from the heel to the crown of the head, and covered with black hair, with which dark red hair is mingled. It is a native of Borneo, Sumatra, and probably of other neighbouring islands, inhabiting the deepest recesses of the forests, and much more rarely seen by man than its congener the orang, which was at one time supposed by the most eminent naturalists to be the same species in a younger state. It is sometimes called the Black Orang. It has a very prominent muzzle, a large mouth, the face nearly naked, except the lower part, which has a beard. Little is yet known of the habits of the pongo. It is believed to feed chiefly on fruits. It possesses great strength, and like the orang, is evidently adapted by its

conformation for moving chiefly among the boughs of trees.

PONIATOWSKI, a celebrated princely family of Poland, is of Italian origin, being directly descended from the family of the Torelli, whose ancestors were Counts of Guastalla. One of the Torelli family having settled in Poland, assumed the name of *P.* from his wife's estate of Poniatow in that country. Those of the *P.* family, who make a figure in history are **PRINCE STANISLAS P.**, who, in the war of succession to the kingdom of Poland, joined Charles XII. of Sweden in supporting Stanislas Leszczynski; his sons, **STANISLAS-AUGUSTUS**, the last king of Poland (*q. v.*), and **ANDREW**, who rose to great distinction in the Austrian service; and Andrew's son, **JOSEPH-ANTONY, PRINCE P.**, the celebrated Polish chief in the army of Napoleon. Joseph-Antony was born at Warsaw, 7th May 1762, and at the age of 16 entered the Austrian army, with which he made the Turkish campaign of 1787, and rose to the rank of colonel of dragoons. In 1789, he returned to Poland, and was named commander-in-chief of the army of the south, having under him Kosciusko, Wielhorski, Lubomirski, and other celebrated leaders. His army, though much inferior in numbers to that of Russia, which, in 1792, invaded the country, gained the brilliant victories of Polonné and Zieloné; but *P.*'s uncle, King Stanislas, by agreeing to the convention of Targowitz (*q. v.*), put an end to the contest in 1793. The prince then resigned his command, and went into voluntary exile, but returned in the following year to aid Kosciusko, now dictator, in his fruitless opposition to the third partition of Poland. On the proposal of Napoleon to reconstitute the kingdom of Poland, *P.* joined the French (1800) at the head of a Polish army, and did good service against the Russians at the battles of Golymin, Danzig, and Friedland; but the French emperor, by the treaty of Tilsit, handed over Poland to its enemies, and only the duchy of Warsaw (nominally subject to the king of Saxony) was left intact. *P.* was appointed generalissimo and commander-in-chief for the duchy; and so zealously did he labour for the development of its military resources, that, in 1809, when the war between France and Austria was resumed, he was able to drive the Austrians out of the Polish territory, and overran a considerable part of Galicia. He continued to administer the military affairs of the duchy till 1812, when he joined the French army, destined to invade Russia, with a Polish army of 100,000 men. But to his intense disgust, the greater part of his army was broken up into detachments, which were incorporated with the various French legions, and *P.* was left with not more than 30,000 men under his direct command. At the head of this division, which always composed the extreme right of the French army, *P.* gathered innumerable laurels on the battlefield, and at the storming of the Russian fortresses; but he was so severely injured at Smolensko during the retreat, that he was obliged to return to Warsaw (December 1812). In the following autumn, he resumed his old place in the French army, and on October 16, received from the emperor the dignity of Marshal of France, an honour, in his own estimation, much inferior to that of 'generalissimo of the Poles,' which he already possessed. After the defeat at Leipzig (*q. v.*), *P.* was left with the remnant of his Polish division to protect the French retreat, which he accomplished by keeping the Prussians in check for several hours; at last, when his force was reduced to 300 men with 30 horses, and himself severely wounded, he retreated over the Pleisse, swimming his horse through the river; but in attempting similarly to cross the Elster, exhausted

nature could no longer bear up, and he sank to rise no more, October 19, 1813. His body was recovered six days after, and was embalmed and carried to Warsaw, whence it was afterwards removed to Cracow, and placed beside the ashes of Sobieski and Kosciusko.

PONT-A-MOUSSON, a town of the German Empire, in Lorraine, on the railway from Nancy to Metz, 20 miles north-north-west of the former of these towns. The Moselle flows through the town, which is situated in a fruitful valley. There is a fine Gothic church dedicated to St Martin. P. has some manufactures of pottery. Pop. 8115. It was the birthplace of Marshal Duroc, the favourite and friend of Napoleon.

PONTCHARTRAIN, LAKE, in Louisiana, U.S. America, about 5 miles north of New Orleans, with which it communicates by a canal, is 40 miles long, and 24 miles in extreme width. It is navigated by small steamers, and communicates on the east with the Gulf of Mexico, and on the south with the Mississippi. Its greatest depth is from 16 to 20 feet.

PONTECORVO, a city of southern Italy, in the province of Caserta, situated on the river Garigliano, 37 miles north-west of Capua, its inhabitants being almost all engaged in agriculture. It has an old castle, many churches, and is a bishopric. It formerly belonged to the pope; but since 1860 it forms part of the kingdom of Italy, and is a sub-prefecture. Napoleon I. gave the title of Prince of Pontecorvo to Marshal Bernadotte, afterwards king of Sweden. It has a cathedral. Pop. about 12,000.

PONTÉ DELGA'DA, a town on the south coast of the island of St Michael, one of the Azores (q. v.), in lat. 37° 40' N., and long. 25° 36' W. It is defended by the Castle of St Braz, which can mount 90 pieces of cannon, and by the forts of São Pedro and Rosto de Cão. The anchorage in the roadstead is bad and the harbour is shallow, but still the trade (which is largely in the hands of English merchants) is the most considerable of all the towns in the Azores. The chief exports are wheat, maize, and oranges. Pop. estimated differently from 16,000 to 22,000.

PONTEFRAC'T (commonly pronounced *Po'm-fret*), a market-town and municipal and parliamentary borough, in the county of York, and 24 miles south-south-west of the city of that name, on the Lancashire and Yorkshire Railway. There are two churches, viz., St Giles and All-Saints, the latter is in the Early English style, and has a handsome tower. There are a grammar, as well as national and other schools, several almshouses, a large workhouse built in 1864, a splendid market hall opened by Lord Palmerston in 1860, &c. In the vicinity are extensive gardens and nurseries. Eight fairs for the sale of cattle take place annually. The trade is chiefly in corn, liquorice, and malt. Two members are returned to the House of Commons for the borough. Pop. of municipal borough, 8798; of parliamentary borough, 15,329.

The castle of P., built shortly after the Conquest, was a large and strong edifice, and stood on a commanding height. It was the scene of the imprisonment and death of Richard II., and here also Rivers, Grey, and Vaughan were put to death, at the instigation of Richard III. The remains of the castle to be seen at the present day are very meagre.

PONTEFRAC'T CAKES are small lozenges of refined liquorice, which have for centuries been made at Pontefract, and are much esteemed. They

are impressed with a rude figure of a castle, intended to represent Pontefract Castle.

PONTEVEDRA, a town of Spain, province of Galicia, is situated on a peninsular slope near the mouth of the river Lerez, 35 miles south of Santiago. P. is a clean and pretty place, with high old walls, granite-built houses, broad streets, and pleasant arcades. It takes its name from the bridge (*Pons Vetus*) that spans the river. The Pontevedrans are engaged chiefly in agriculture, though sea-fishing is also carried on, and there are some manufactures. Pop. 6623. The neighbourhood, of which charming views are obtained from parts of the town, is covered with villas, farms, and woodlands.

PONTIANAK, the capital of the kingdom of the same name on the west coast of Borneo, is situated near the junction of the Landak and Kapuas. It is built on both banks of the river, which is 900 feet broad, and thence to the sea is called the Pontianak. The city derives its importance from being the seat of the Netherlands' Resident, who rules directly and indirectly over the whole west coast, from 2° 56' S.—2° 50' N. lat., and 108° 45'—112° 50' E. long.; territories rich in vegetable and mineral wealth. The Residency is near Fort Du Bus, in 0° 2' N. lat., and 109° 1' 30" E. long.; other principal buildings being the sultan's palace, the mosque, and hospital. Pop. 7000, but rapidly increasing. Trade is the only pursuit in the town; and the rich alluvial lands are partly cultivated with rice, sugar-canes, cotton, indigo, coffee, provisions, and fruits.

Besides a number of small dependencies, the Netherlands' Resident at P. governs the important kingdoms of Landak, Mampawa, and Sambas, with the mining district of Montrado, in the north; Tayang, Simpang, and Matan or Succadana, to the south; and Sangouw, Sekadouw, and Sintang, in the interior. The produce consists of diamonds, gold, coal, tin, iron, wax, edible nests, pepper, gutta-percha, &c. There are many gold mines in Montrado and other districts; rich iron ores in Matan; gold, platina, copper, &c., in Sambas; and in former times, Landak was rich in diamonds, but the produce is now trifling. In this district was found the famed diamond of the Sultan of Matan, which weighed 367 carats. The annual produce of the mines in the Residency of P. is estimated at not less than 425,000 ounces of gold. The population is about 375,000, of whom 200 are Europeans, 25,000 Chinese, 90,000 Malays, and 250,000 Dyaks, &c. The annual Dutch imports and exports amount to about \$1,000,000. About 70 vessels of above 10 tons burden, having an aggregate tonnage of about 1800 tons, belong to this Division of Borneo. The other Netherlands' possessions in Borneo are called the Residency of the South and East Division, including the lands from Matan, in the south-west, along the south and east coasts, to 0° 50' N. lat. The Resident's house is at Banjermassin, in the island of Tatas, 15 miles from the mouth of the Banjer, in 3° 34' 40" S. lat., and 114° 30' E. long. Pop. 30,000. The exports are—pepper, diamonds, gold-dust, coal, benzoin, wax, ratans, dragon's-blood, camphor, edible nests, iron, fire-arms, &c. Imports—piece-goods, powder, knives, opium, rice, salt, sugar, Chinese porcelain, silk-stuffs, corals, pearls, &c. In 1874 the coal-mines of Orange-Nassau produced 3,637 tons. On the east coast there is also coal, and the Sultan of Kutei delivers it according to contract for the use of the Dutch navy at about \$5 per ton. During 1872 the imports of the South and East Residency amounted to about \$1,325,000, and the exports to about \$600,000. The vessels above 10 tons belonging to it numbered 30, with a tonnage of 2,543 tons. At Nagara, a town of 10,000 inhabitants, in Banjermassin,

are important factories of fire-arms and other weapons.

There has been constant war, on the south-east coast, since 1859. In 1860, the direct government of Banjerassin was assumed by the Resident, but the interior of the kingdom has of late been much disturbed through the war with Atcheen inciting the Mohammedan population against the Dutch. In 1873 the population of the South and East Division was 869,763, of whom 403 were Europeans, and 2,643 Chinese.—See *Borneo's Westerafdeeling, Geographisch, Statistisch, Historisch* (P. J. Veth, Amsterdam); the latest Colonial Reports by the Netherlands Secretary of State for the Colonies, &c.

PONTIFEX (of doubtful derivation) was the title borne by the members of one of the two great colleges among the ancient Romans, instituted for the purpose of preserving and cultivating religious knowledge; the other was the college of Augurs. See **AUGURES** and **AUSPICES**. It is customary to speak of the college of pontiffs as a 'priesthood'; it was not, however, strictly speaking, such—that is to say, the members were not charged with the worship of any particular divinity, nor did they conduct sacrifices. Their duties embraced the regulation of all the religious rites and ceremonies (both public and private) of a state—e. g., how the gods should be worshipped, how burials should be conducted, how the souls of the dead (manes) should be appeased. To them was intrusted the care of the calendar, the proclamation of festival days, &c. They also saw that every religious and every judicial act took place on the right day. 'As they had thus,' says Dr Mommsen, 'an especial supervision of all religious observances, it was to them in case of need (as on occasion of marriage, testament, or *arrogatio*) that the preliminary question was addressed, whether the matter proposed did not, in any respect, offend against divine law.' In matters of religion, they were the supreme authorities; from their decisions there was no appeal, and they themselves were responsible neither to the senate nor the people; further, they had power to inflict punishment on such priests as dared to disobey their injunctions, and deviate into schismatical courses. The words of Festus are: *rerum quæ ad sacra et religiones pertinent, JUDICES ET VINDICES*. Their president was termed *pontifex maximus*.

The pontiffs, according to Roman tradition, were instituted by Numa—a mythical person, to whom the origin of nearly all the religious institutions of Rome is ascribed. But as they appear in all the Latin communities, they are regarded by Mommsen as a 'thoroughly national Italian institution,' and probably found a place in the earliest religious organisation of the Latin race. Their number was originally four, or, including the *pontifex maximus*, five, all of whom were taken from the patricians. In 300 B. C., the Ogulnian Law raised the number to nine, four of whom were to be plebeians. The first plebeian, however, who attained the dignity of *pontifex maximus* was Tib. Coruncanius, 254 B. C. Sulla, in 81 B. C., again increased the number to 15, and Julius Caesar to 16. During the empire, the functions of *pontifex maximus* were generally discharged by the emperors themselves; and the name survived even the establishment of Christianity, occurring in inscriptions of Valentinian, Valens, and Gratianus; but at length the emperors dropped it, when it was picked up by the Christian bishops of Rome; and now this title, borrowed from a pagan cult, forms one of the sacred designations of His Holiness the Pope.

PONTIFICAL (Lat. *pontificale*, belonging to a pontiff or bishop), one of the service-books of the

Church of Rome, in which are contained the several services, whether in the administration of sacraments or the performance of public worship, in which the bishop exclusively, or at least a priest delegated by the bishop, officiates. There were many such collections for the various national churches; but that which is now in universal use throughout the Western Church is the *Pontificale Romanum*, or Roman Pontifical, as published by authority of Clement VIII. in 1596, and repeatedly republished since that time. The P. contains the services for ordinations, for religious professions and receptions of monks and nuns, consecrations, benedictions, &c., as well as of the solemn administration by a bishop of those sacraments which are ordinarily administered by priests. Besides the prayers to be recited, the P. also lays down the ceremonial to be observed. The rules of this ceremonial are of two kinds—*preceptive*, the literal observance of which is obligatory; and *directive*, which admit of a certain interpretation.—Another of the service-books of bishops is called the 'Ceremoniale'; but it is chiefly confined to a description of the peculiar ceremonial with which bishops are required to celebrate solemnly those offices, as of the mass, vespers, the funeral office, &c., which are common to them with priests. The most prized editions of both these service-books are those published by authority of the learned pope, Benedict XIV.

PONTINE MARSHES (Lat. *Pomptina Paludes*), a low-lying district, forming the southern part of the Campagna di Roma, and extending in a south-easterly direction from Cisterna to the sea at Terracina. Its greatest length is about 30 miles, and its breadth from 4 to 11 miles. It does not reach the sea-coast on the west, being separated from it by a broad sandy tract covered with forest; but even this barrier partakes to some extent of the character of the marshes themselves, being quite as flat, and largely intermixed with swamp and lagoon. The P. M. have undoubtedly been formed by the stagnation of the streams that take their rise in the Volscian Hills, and by the accumulation of sand along the shore from Astura to the Circeian promontory, but this formation as undoubtedly belongs to pre-historic ages. There is no reason to believe that the P. M. were, in ancient times, essentially different from what they are at present. Pliny, it is true, on the authority of a contemporary, Mucianus, states that at one period they had contained 24 or even 33 cities; but no confirmation of this statement is to be found in any earlier writer, and not a single name of these cities has been preserved. The first attempt to drain the P. M. in ancient times was made in 160 B. C. by the consul, Cornelius Cethegus; but his efforts were only partially successful, for towards the close of the Republic, the region had become as marshy as ever. Julius Cæsar, among his vast schemes for the improvement of the commonwealth, projected one for the drainage of this pestilential district, but his murder prevented its complete realisation. Augustus also appears to have done something; but in the time of Juvenal, it was a mere haunt of robbers. Theodoric, the Goth, likewise tried to reclaim it; but the desolations of succeeding reigns soon reduced it to a hopeless condition, and it continued an uninhabitable region until the close of the middle ages. The first in modern times to resume the labours of the ancients was Pope Boniface VIII., who drained the district about Sezzo and Sermonetta by means of a large canal. In 1417, Martin V. made another canal, called the *Rio Martino*, which was dug to within a mile of the sea; but after his death, the project was given up. Several additional efforts were subsequently made;

but nothing was really accomplished till the time of Pope Pius VI., who, in 1778, commenced to drain the marshes, and completed the drainage in ten years. The reclamation of the land, however, has been found possible only in part. Though much is under cultivation and in pasturage, a great portion is hopelessly sterile; and the whole region is so unhealthy, that, in the summer months, the inhabitants are obliged to remove to the neighbouring mountains.—The famous Appian Way (q. v.) went through the P. M.; and after being unused for centuries, was re-opened by Pius VI.

PONTOON (through the French *ponton*, from the Latin *pons*, a bridge), the name given to buoyant vessels used in military operations for supporting a temporary bridge. Pontoon bridges have been constructed, with greater or less skill, from the earliest times. Darius passed the Hellespont and Danube by pontoon bridges, and the former was traversed by Xerxes' immense army on similar temporary bridges, very admirably formed. A pontoon train is a necessity for every army manœuvring in a country where there are rivers, and many campaigns have proved failures from the want of this cumbrous but indispensable apparatus. In most armies, the pontoons are under the charge of the engineers; but in the Austrian army there is a distinct and highly-trained corps, called *Pontonieren*. Marlborough used clumsy wooden pontoons. Napoleon and Wellington had them lighter of tin and copper. They were flat-bottomed, rectangular boats, open at the top. Anchored at stem and stern, beams were laid over from one to another, and transoms with planks crossing these beams completed the roadway of the bridge. These open pontoons were exposed to the disadvantage that they were very liable to be filled with water, and thus ceased to support the bridge. They were, moreover, very heavy, one pontoon, with appurtenances, constituting a wagon-load. As 36 were deemed necessary for the train, a pontoon equipment was a serious item in the *impedimenta* of an army. The open pontoons are now, however, obsolete, modern science having substituted closed cylindrical vessels of copper (or occasionally of India-rubber), which are far lighter, can in an emergency be rolled along, and can only be submerged if perforated. Against the last contingency, they are divided within into water-tight compartments, so that one perforation may not seriously detract from the total buoyancy of a pontoon. In the British service, two pontoons are used: the larger, with hemispherical ends, being 22 feet 3 inches in length, and 2 feet 8 inches in diameter; the smaller, cigar-shaped, with conical ends, 15 feet in length, and 1 foot 8 inches in diameter. Two of the largest used to form a raft weigh 8 cwt. 7 lbs.; the superstructure, 18½ cwt. At 24 feet apart from centre to centre, this raft, will carry infantry four deep, marching at ease; cavalry, two deep, and light field-guns; at 16 feet interval, heavy guns. A raft of three pontoons, at close distances, will support siege-ordnance. The pontoons can be used in very wide rivers as rafts, in their proper sense, or they can be connected, when the width permits, to form a bridge. In the latter case, each is towed into line, anchored above as it drops to its place, and a second time when its exact spot is reached. It is computed that each pontoon requires 1½ minutes to take its position, and that when the pontoons are placed, the roadway can be laid, if properly arranged previously, in 1½ minutes for each interval between two pontoons. A river of 600 feet may thus be bridged in less than 1½ hours. The process of throwing a bridge over in face of an enemy, is fraught with the utmost danger to the engineers employed.

Pontoon bridges have to be passed with great care, and every measure should be adopted, as breaking step, &c., which can reduce the peculiarly dangerous vibration.

PONTUS, the name given by the ancient Greeks to a country in the north-east of Asia Minor, bordering on the Pontus Euxinus (whence its name), and extending from the river Halys in the west to the frontiers of Colchis and Armenia in the east. Its southern limits were the ranges of Anti-Taurus and Paryadres, so that it corresponded pretty nearly to the modern pashaliks of Trebizond and Siwas. On the east and south, P. is mountainous, but along the coast there are large and fertile plains, which in ancient times produced, and indeed still produce abundance of grain, fruits, and timber. Game, according to Strabo, was also plentiful. The rearing of bees was carefully attended to, and honey and wax were among the chief articles of commerce. Iron was the principal mineral.

Regarding the ancient inhabitants of P., nothing is known ethnologically. Greek colonies, indeed, flourished on the coast from the 7th c. B.C., and doubtless spread some knowledge of civilisation among the inland barbarians; but how far the latter were influenced thereby, we cannot tell. They first appear as divided into numerous tribes, virtually independent, but owing a nominal allegiance to the Persian kings, whose authority was represented by a hereditary satrap belonging to the royal family of Persia. It was one of these satraps, Ariobarzanes, who, by subjugating some of the Pontian tribes, in the year 363 B.C., during the reign of Artaxerxes II., laid the foundations of an independent sovereignty. Ariobarzanes was succeeded in 337 B.C. by Mithridates II., who took advantage of the civil confusions that followed the death of Alexander the Great, to enlarge his dominions; but the greatest of these Pontine sultans, and one of the most formidable enemies that Rome ever encountered in the east, was Mithridates VI. (q. v.). On the overthrow of this potentate by Pompey (65 B.C.), the western part of P. was annexed to Bithynia, and the rest parcelled out among the neighbouring princes. Subsequently, a grandson of Mithridates, Polemon, was installed monarch of the central part of P.; but in the reign of Nero, it was voluntarily ceded to the Roman emperor, became a Roman province, and was called *Pontus Polemoniacus*. In the reign of Constantine, it underwent a new division. The principal towns of ancient P. were Amisus, Polemonium, Pharnacia, Cerasus, Trapezus, Apsarus, Cabira, and Neocæsarea.

PONTYPOOL, a small market-town of Monmouthshire, 20 miles west-south-west of Monmouth, and 10 miles north of Newport, with both of which it is connected by railway. Japan wares were long made here, but this branch of manufacture has declined. Articles in polished iron are made, and the iron forges and coal and iron mines which surround the town employ many of the inhabitants. Pop. (1851) 3708; (1871) 4834; (1881) 5244.

PONY, the common name of many small active breeds of Horse (q. v.), belonging to different countries, from India and Africa to Iceland; but in the warmer parts of the world, chiefly found in mountainous or sterile regions. They are in general the property of man, and not truly wild, although, in very many cases, they live almost in a wild state, and receive no care or attention except when they are wanted for use. They are in general very hardy, and their strength is great in proportion to their size. They are often vicious, or at least playfully tricky to a much greater degree than is usual with larger horses. Ponies are very often covered

with rough hair, and have large shaggy manes and forelocks. The *Shetland P.* is a very good example of these small races of horse. The *Iceland P.* is scarcely different from it, and is hardy enough to endure the winter of Iceland without shelter. The *Galloway, Welsh, Dartmoor, Exmoor, and New Forest* breeds, are British races of P., larger than the Shetland. The progress of enclosure and cultivation in their native regions has so changed the circumstances in which they long subsisted, and in which, perhaps, they originated, that scarcely any of them is now to be seen of pure and unmixed race. Sardinia and Corsica have small races of P., which have subsisted unchanged from ancient times. In the Morea, there is a race of ponies, driven in herds to Attica for sale, exceedingly wild and vicious, but capable of being rendered very serviceable. But it is unnecessary to mention the many races both of Europe and Asia. They differ considerably in size, some, like the Shetland P., suggesting a comparison with a large dog, some much larger. They also differ much in colour; a dun or tan colour, with a black stripe along the back, is prevalent in many of them. Ponies are seldom employed in agricultural labours; but they are of inestimable value in many wild and mountainous regions, from their hardiness and surefootedness; and are often used as saddle-horses, the largest kinds being even employed as horses for light cavalry.

POODLE (Germ. *Pudel*), a kind of dog, originally German, but extensively diffused throughout Europe during the wars of the French Revolution, and abundantly introduced into Britain by the soldiers who served in Spain and the Netherlands. It is very closely allied, however, to the coarser crisp-haired *Water-dog*, long well known in England, and particularly to water-fowl shooters and the fishermen of the north-eastern coasts. The *Barbet* of the French is a diminutive variety, much in request as a lady's pet. The P. is of a stout form, and has a short muzzle standing out abruptly from the face; the ears are of moderate length, and pendent; the tail rather short; it is everywhere covered with long curled hair, which in many of the little barbets hangs to the very ground. No kind of dog exhibits greater intelligence or greater affection; and as to both, many interesting stories are on record.

POOLE (so called from the inlet or *pool* on which it stands) is the chief seaport of Dorsetshire, and is situated on a wide but shallow inlet in the east coast of the county. It is built of red brick, is intricate and confused in plan, but is pierced by the High Street, a mile in length. Along the shore are capacious quays, well lined with shipping. The town is more noted for its trade than for its architecture. Sail-cloth and cordage are manufactured, and, together with potters' and pipe clay, provisions, and articles of clothing, form the principal articles of export. Ship, and especially yacht building is carried on. The harbour, into which fall the rivers Trent and Frome, is a beautiful estuary, and is a fine feature in the charming scenery of the vicinity. Its depth of water is 13 to 14 feet, and its navigable channels, being unobstructed by rocks or sands, are perfectly safe at all times. Brownsea Island, in the middle of the pool, is 6 miles in circumference. On its extreme point stands the castle of the same name. About 700 vessels of an aggregate tonnage of 60,000 tons enter and clear the port annually. Pop. 10,079, who return one member to parliament.

POOLE, MATTHEW, a learned English divine of the Puritan age, was born at York about the year 1624, and educated at Emmanuel College, Cambridge. Very little is known regarding his life.

In 1662, he figures as preacher in the church of St Michael le Querne, in London; but was one of the 2000 ministers whom the Act of Uniformity compelled to leave the Church of England. Subsequently, he retired to Holland, and died at Amsterdam in 1679. His principal work, *Synopsis Criticorum Biblicorum* (5 vols. fol. 1669—1676), is an attempt to bring together in a condensed form the opinion of 150 biblical critics of all times and countries previous to his own. It is a work shewing great (professional) learning, and very respectable talent; but later criticism and research have done much to render it obsolete. Other productions of P.'s are *Annotations on Scripture*, and *The Nullity of the Roman Faith*.

POONA, or PUNA, the capital of a district of British India, of the same name, in the presidency of Bombay, is situated on the small river Moota, near its confluence with the Moola, in a treeless plain about 74 miles south-east of Bombay. Its present population is estimated at about 100,000, but in its palmy days, when it was the capital of the Mahratta power, it contained twice that number. A large proportion of the population consists of Brahmans. The city is divided into seven quarters, named after the days of the week, and the principal building is a palatial structure, formerly the residence of the Peishwah. Its climate is salubrious and pleasant, and it is the headquarters of the Bombay army. The cantonment for the infantry and horse-artillery is from one to two miles west of the city. The cantonment for the cavalry is at the village of Kirkee, about two miles to the north-east of the city. In 1821, soon after P. came into the possession of the British, a college was established for the study of Sanscrit literature, in the hope that the disaffected Brahmans (who had been all-powerful under the Peishwah) might be thus conciliated. As the modes of instruction originally adopted were entirely native, and far from efficient, the college has gradually been transformed. At present, it possesses a staff of European professors with native assistants, and is a highly respectable seminary for the study of English, Marathi, and Sanscrit. Only Brahmans were admissible into the college as first established; now it is open to the public generally. P. is very much resorted to, particularly in the rainy season (from June till October) on account of its pleasant and salubrious climate. The fall of rain averages from 22 to 25 inches annually; whereas at Bombay it is about four times as great. The range of the Ghauts (properly called the Sahyadree range) which rises up as a precipitous barrier 2000 feet high, with peaks considerably higher, receives the full burst of the monsoon; so that Khandalla on the top of the Ghauts is drenched with almost perpetual rain for four months. Then the clouds pass on, relieved of their watery burden, and the rainfall eastward of the Ghauts is much less. From the Ghauts, the whole country gradually slopes towards the Bay of Bengal. P. is about 1800 feet above the sea-level. One of the most interesting objects in the neighbourhood of P. is a large *bund*, or embarkment, solidly built of hewn stone over the Moota-moola river for the purpose of providing a supply of water for the cantonment, and especially the bazaar or native town connected with it. It was built by the late Sir Jamsetjee Jeejeebhoy, whose charities were very great. Two forts celebrated in Maratha history are close to Poona-Singhur, about 12 miles to the south-east, and Poorundur, about 18 miles to the south. These are favourite sanatoria during the hot season (from the end of February to June). At Poorundur there is a sanatorium of considerable size for sick soldiers. P. was formerly a great mart for jewellery and precious

stones, but the trade in these things has quite ceased. The native manufactures have also been supplanted by the introduction of European piece-goods, and the only business that prospers is that of dealers in grain and other agricultural produce. The railway has rendered P. almost a suburb of Bombay. The works by which the railway climbs up the great mountain-barrier of the Ghauts from the low lands of the Konkan to the high table-land of the Deccan are among the boldest that have as yet been undertaken. The line up the Ghauts was opened in April 1863.

At present, great alterations are taking place around Poona. The native city has not of late years greatly altered, except that the streets have been widened and cleaned; but the cantonment is changing rapidly. The number of new buildings reared within the last three or four years is very great. Among the most striking of these will be, when it is finished, the Government College—a Gothic building, erected mainly at the expense of Sir Jamsetjee Jeejeebhoy. While speaking of education in Poona, it is but fair to the Scottish mission to say that it commenced English education in P. soon after the mission was established (in 1831), and has all along carried it on. The schools of the mission, both male and female, both for English and the vernacular (Marathi), are largely attended, even by the highest castes. The female pupils are upwards of 300 in number; and one school consists of Musulman girls. The Musulmans in India generally are far behind both Hindoos and Parsees in their desire to educate the females; in fact, a Musulman female school is as yet exceedingly rare.

POONA-WOOD is the timber of the Poon trees of India (*Calophyllum inophyllum* and *C. angustifolium*). It is very commonly used in the East Indies, particularly in ship-building, for planks and spars; these latter are usually called *Poon*, and are in general use for masts in that country. The trees are natives of Penang, and of the countries eastward of the Bay of Bengal.

POOP, in large vessels, is a sort of supplemental deck raised over the after-part of the upper deck. The best cabins are situated beneath it. In old ships, a second and even a third poop were raised above the hinder part of the poop proper, giving the vessels that immense height at the stern which is shewn in old drawings. The poop is gradually disappearing from ships built either for speed or war, as offering undue resistance to the wind in one case, and an undesirable mark to an enemy in the other.

POOR AND POOR-LAWS. Charity, like Christianity, had its origin, or earliest development, in the East. Among the primitive nations of the world, almsgiving was inculcated as a religious observance, and is prescribed as such in their sacred records. Among the European nations of antiquity, we find a provision for the poor adopted as a matter of state policy. In early times, Athens could boast of having no citizen in want; 'nor did any disgrace the nation by begging.' But war, at length, brought poverty in its train, and the Athenian people decreed the maintenance of those who were mutilated in battle; and, at a later period, of the children of those who fell. Plutarch mentions Peisistratos as the originator of the first decree, though others derive it from Solon. By the latter decree, the state provided for the orphans of its soldiers up to their eighteenth year, and then sent them into the world with a new suit of armour. The bounty given to the disabled is mentioned by Lysias, Harpocration, Aristotle, Isocrates, and others; and is variously stated at one, two, and

three oboli a day, and it seems to have been increased with the increased cost of subsistence. There were also societies for the relief of distress among the democratic states of Greece, called *Eranos*—a sort of friendly society, in which the members relieved were expected to pay back the money advanced to them, when they had raised themselves to better circumstances. But it must be remembered that these so-called democratic states were in reality slave-holding aristocracies.

Among the Romans, the Agrarian and Licinian laws (years of Rome 268 and 338) were framed in order to prevent the extremes of riches and poverty in the state. They limited the extent of property in public land to be held by each citizen, and the latter directed that all such land, above the allotted portion, should be taken away from the holders, and given to those who had none. The distribution of grain at reduced prices, which at length became gratuitous, was introduced by Caius Gracchus, and lasted till the fall of the Roman empire. Augustus in vain tried to suppress it. In his time, 200,000 citizens were thus fed. Cicero makes mention of this provision as in great favour with the Roman people, because it furnished them with an abundant subsistence without labour; other Roman writers describe its results as disastrous both to agriculture and manners, creating a nation of mendicants, and causing the land to fall out of cultivation.

In the middle ages, the great body of the labouring classes were in a state of bondage, and looked to their feudal lords for maintenance. The obligation to provide for their slaves, or serfs, seems to have been fully recognised, so that many encountering, in a state of freedom, the miseries of want, went back to bondage as a refuge from destitution. The villeins in Saxon England were attached to the soil, and received from their lord a portion of land for the support of themselves and their families. But the church of Rome constituted herself the great receiver and dispenser of alms. The rich monasteries and abbeys distributed doles to the poor. Fuller, in his *Church History*, says that these alms 'made and maintained the poor,' so that beggary became a trade to which an apprenticeship was served; and Mr Hallam, in his *Constitutional History*, says the blind eleemosynary spirit of the church 'was the cause, not the cure of beggary and wretchedness.'

In the Catholic states of Europe at the present day, the church still remains, to a great extent, the public almoner. In Rome, a Commission of Aids has the general direction and administration of the principal public charities. It is composed of a cardinal-president and 15 members, among whom is the pope's chaplain. The city is divided into twelve districts, over each of which a member of the central council presides. Each parish is represented by its curé and two deputies—a layman and a *dame de charité*, named for three years—and has a secretary and a steward or treasurer, who are paid. The alms are given in money, tools, and clothes. Requests for assistance are addressed to the parochial body, from which they are sent to the district, and thence to the central council. The more urgent cases are referred to the cardinal-president, or the curé of the parish. Three brotherhoods search out cases of hidden poverty; and not only do all the religious associations, convents, and monasteries distribute relief, but there is hardly a noble or wealthy house which does not take a regular part in the assistance of the poor.

In Spain, the state supports several asylums for lunatics, the blind, and deaf and dumb. It also distributes a large sum annually among the provinces for the relief of the poor—each province being bound

to raise double the amount received from the state. The state also steps in for the relief of great calamities, and devotes a certain sum annually for the assistance of unfortunate Spaniards abroad. A general directory of the charitable and sanitary services superintends the parochial bodies charged with the distribution of assistance to the poor.

In Austria, each commune is charged with the relief of its poor. All who have legal domicile, or being unable to prove their domicile, are resident in the commune, are entitled to relief out of the general assessment. There is no special rate, and the administration is strictly municipal. In many provinces, private charity is associated with public assistance, administered by the curé, a few chosen inhabitants, who are called 'Fathers of the Poor,' and an officer accountable to the commune. This system is called the 'Poor's Institutes;' and their funds are principally derived from private sources; but they receive a third part of the property of ecclesiastics who die intestate, and certain fines, &c. Applicants are subjected to minute inquiry as to the cause of poverty, and a weekly allowance is made on a scale according to age and necessity. The infirm poor, who have no relatives to reside with, are taken into hospitals established in almost every commune, where they receive, besides lodging, fire and light, clothing, medical care, and a small allowance in money to provide for their food and other wants. Children are either provided for in the homes of their parents, put into asylums, or boarded with people of probity, who receive a monthly payment, as in Scotland. The welfare of these children is superintended by the curés, the maires, and the sanitary officers of the commune. Foundlings, lunatics, the blind, deaf, and dumb, are provided for by the state. Vagrancy is punished, and parents permitting children under fourteen to beg are liable to three months' imprisonment. Able-bodied vagrants are sent to houses of correction, and kept to work. Pawnbroking is a charitable institution in Austria, under government control; and many pawnbroking establishments rest on endowments, and lend without interest. The trade is forbidden to private persons.

In France, the relief of the poor is not compulsory, in as far as its distributors may, after making inquiry, refuse relief, except in the case of foundlings and lunatics. The Minister of the Interior has a general superintendence of the machinery of relief, as well as the immediate administration of many large hospitals and refuges. He also assists a great number of private charities. The other ministers of state give assistance on the occurrence of great calamities. The departmental funds are called upon for the compulsory relief, but the commune is the main source of public assistance. Its duty is to see that no real suffering remains unrelieved, and that the nature of the relief is such as can most easily be discontinued when the necessity ceases. The commune encourages and stimulates voluntary charities, and receives gifts for the benefit of the poor's funds. Except in Paris, the administration of the hospitals, and of the relief given at the homes of the poor, are under different management, the communes only interfering to supplement the funds of the hospitals, when these are insufficient. The maire is president both of the administration of the hospitals and of the body for giving out-door relief (the *bureau de bienfaisance*). During industrial calamities, the poor are sometimes employed in workshops supported by the public, and in public works. In Paris, since 1849, there has been a responsible director set over all the charities of the city. He manages the out-door relief through the *zeum* of the Committees of Assistance, formerly

called *bureaux de bienfaisance*, in each *arrondissement*. He is under the inspection of a council, composed as follows: The Prefect of the Seine (president), the Prefect of Police, two members of the Municipal Council, two maires or deputy-maires, two members of the Committees of Assistance, one councillor of state or a Master of Requests, one physician and one surgeon practising at the hospitals, one professor of medicine, one member of the Chamber of Commerce, one member of the Council of Prud'hommes, and five members taken from other classes than those above mentioned. Begging is forbidden, and punished, wherever there are establishments for the relief of the poor.

In the Hanse Towns, there was introduced, in 1788, a system of voluntary contributions aided by fixed subsidies from the government. This at length resulted in government supplying all deficiencies, which in the last few years have been 80 per cent. of the cost of the general poor relief. In Holland, pauper colonies have been supported by government for the last forty years. Vagrants, after a short imprisonment, are sent to one of these, under a system of discipline quite as rigorous as an Irish intermediate prison. Paupers of good character are sent to maintain themselves and their families, by agricultural labour, in free colonies. The working of the system is pronounced costly and unsatisfactory.

In America, the system is very similar to the English. Every man is entitled by law to relief from the town of his settlement, the rate being assessed on whole towns, and not on parishes. The States have their own poor-laws, but paupers are removable from one state to another. Any American becoming a pauper loses his state rights. The acts concerning Workhouses and Paupers in the Revised Code of Massachusetts may be taken to represent generally the state of the law throughout the Union. The former provides 'that any town may erect or provide a workhouse for the employment and support of all poor and indigent persons that are maintained by, or receive alms from the town; all persons who being able to work, and not having means to maintain themselves, refuse or neglect to work; all persons who live a dissolute vagrant life, and exercise no ordinary calling or lawful business; and all such persons as spend their time and property in public-houses, to the neglect of their proper business, or by otherwise mis-spending what they earn, to the impoverishment of themselves and their families, are likely to become chargeable to the town or the commonwealth.' The idle and the vagrant may be committed to the workhouse, and kept to labour, as in a house of correction. There are provisions for enforcing the claims of kindred, and for the immediate relief of strangers. The administration is in the hands of overseers, who have discretion as to the mode of relief.

The annals of the poor in England are neither short nor simple. Severe enactments for the repression of vagabondage and mendicancy date from a very early period. In ancient Saxon times, the householder was bound to provide for the labourer, and men who had no master were, by the Folk-mote, assigned to some householder; but when freedom began to prevail, this state of things naturally came to an end. No master was bound to provide for the freeman, and when he failed to provide for himself, by honest labour, he generally took to vagrant begging, often to violence. The statute of Winchester (13th Ed. I., 1285) shews the poor utterly uncared for, and the roads infested by vagrant robbers. Up to the reign of Richard II., the sole idea of English rulers was to treat pauperism as a crime, and repress it by punishment, and by the

most unjust and absurd restrictions on the freedom of labour. The 23d Ed. III. forbids giving alms to vagrants, on pain of imprisonment; then also the laws of settlement had their origin in the attempt to chain the free labourer to the land. See SETTLEMENT. The 12th Richard II. (1388), c. 7, is the first statute that makes provision for the impotent poor. The statutes of Henry VII. endeavour to carry out, by the severest measures, the system of repression. The 27th Henry VIII., c. 25 (1535), introduced the principle of compulsory assistance, though it was by way of voluntary alms. Each parish was ordered to receive and provide for the impotent, and set the able-bodied to work. Alms were to be collected into a general fund, and indiscriminate almsgiving was forbidden, on pain of forfeiture of ten times the value given. The sturdy beggar was treated without mercy, was to be whipped when first caught, next to have his ear cropped, and for a third offence, to suffer death, as a felon and enemy to the commonwealth. This is repeated by 1st Ed. VI., c. 3 (1547), because, 'through foolish pity, it is rendered of non-effect.' Not much milder, to modern ideas, seem the substituted penalties—viz., branding, on first conviction, with a V on the shoulder, and being adjudged a slave for two years, to be claimed by any one, fed on bread and water, and caused to work by beating, &c. Running away from this tender treatment was punishable with S branded on the face, and slavery for life to the town or parish, on the roads of which the incorrigible vagrant was to work in chains, at the penalty of the town or parish. Other two acts of Edward's reign return to earlier and considerably milder measures of restraint. A little urging was now found necessary to obtain funds for the maintenance of the poor. The collectors were gently to ask every man and woman at church what they would give; but if one could not be persuaded, the bishop was to send for the recusant, and use 'charitable ways and means.' At length, the 5th Elizabeth c. 3 (1563), provided that he who obstinately refused to give should be handed over to the more persuasive arguments of the justices, who were empowered to tax him at their discretion, and send him to jail for default. Ten years later, the power of compulsory assessment is given to the justices, and abiding-places are ordered to be provided for the aged and infirm. These statutes culminated in the 43d Elizabeth, c. 2 (1601), which has formed the basis of the poor-law system of England up to the present time. It taxed every inhabitant of every parish for the relief of the poor. It directed the justices in every county to appoint three or four substantial householders in each parish to be overseers of the poor, along with the churchwardens. It ordered the relief of the impotent, and the apprenticing of children, and the providing of work for the able, by means of 'a convenient stock of flax, hemp, wool, thread, iron, and other necessary ware and stuff.' The great act of Elizabeth came but slowly into operation. Up to the reign of Charles I., there were many parishes in which no rate was assessed, and which turned away their poor; but the great evils had been remedied, and there is little legislation on the subject for the next hundred years. The 3d Will'm and Mary, c. 2 (1691), an act relating chiefly to settlement, provides that the persons to be relieved be registered and examined by the vestry, because evils had arisen out of the unlimited power of the churchwardens and overseers giving relief 'for their own private ends,' by which the charge on the parish was greatly increased, contrary to the true intent of the statute of Elizabeth. This act also gave power to the justices to order relief in cases of emergency, a

provision which afterwards became a fruitful source of difficulty. The evils henceforth complained of were, that many had thrown themselves on the rates who ought to have been supporting themselves independently of such aid; that pauper labour was found interfering with and displacing industrial labour; that the overseers were acting with unchecked dishonesty; and justices, with unrestrained liberality, ordering the money of the industrious and prudent to be spent upon the idle and improvident. Efforts were made to remedy these abuses throughout the reigns of the first three Georges, by making the justices act with the overseers, by rendering the overseers accountable to the parishioners by means of returns and the power of inspection, and by the offer of the workhouse to all applicants for relief. This last provision, made in the reign of George I. (9th Geo. I., c. 7, 1723), substituted what is called in-door relief, for the allowance made to the poor at their own homes, and introduced the workhouse system. All who refused to be lodged in the house, were to be struck off the poor's-roll, and refused relief. A great increase in the number of workhouses took place; guardians were appointed to guard the pauper children from neglect and improper conduct, and other attempts to improve their administration made; Work-house Unions were also introduced by an act called Gilbert's Act (1782), and a succession of acts passed for the protection of parish apprentices. Towards the close of the 18th c. a great relaxation took place in the treatment of the poor. The 36th Geo. III., c. 10 and 23 (1796), increased the amount, and extended the application of relief. It repealed the act forbidding relief to those who refused the workhouse, and allowed relief to be given in aid of wages. Henceforth, out-door relief became the rule under a variety of systems, of which the complaint was justly made, that they turned the poor-laws into a mode of paying wages. In 1801, the amount of the rates was reckoned at £4,000,000. In 1820, it had risen to £7,330,254. In 1817, a commission of the House of Commons stated their opinion, that, unless checked, the assessment would swallow up the profits of the land. Though the two Vestry Acts, which resulted from the commission appointed in 1817, seem to have done something to remedy the evils complained of, a new commission to inquire into the operation of the poor-laws was found necessary, and appointed in February 1832. The evidence brought before this commission revealed a disastrous state of things. The independence, integrity, industry, and domestic virtue of the lower classes were in some places nearly extinct. The great source of the evil was shewn to be the relief afforded to the able-bodied on their own account, and that of their families, in aid of wages. This aid at first reduced the expenditure in wages, and found favour with farmers and magistrates, who framed scales of relief in accordance with the wants of the people, so that they began to be paid for their necessities, and not for their industry, and fell into the temptation of increasing the former, and neglecting the latter. Five modes of out-door relief were found in operation: 1. Relief without labour; 2. Allowance given, in aid of wages, according to the number of the labourer's family; 3. The Roundsmen system, the labourers being let out, by the parish, among the employers round; 4. Parish work, generally on the roads; 5. The labour-rate, the ratepayers preferring to divide among them the pauper labour, and to pay for it, however valueless, instead of raising a rate. Diminished industry ate away the very root of capital. Farmers turned off their men, or refused to employ them at fair wages, thereby causing a surplus of unemployed

labour fraudulently; they then took them back from the parish at reduced wages, paid out of the rates. Under the system of allowance, there were parishes in which every labourer was a pauper, paid more for idleness than he could get for labour, paid more if he took a pauper wife, and still more for every pauper child. Paupers married at 17 and 18 years of age, and claimed the allowance the day after their marriage; and from parish after parish came the reply to the queries of the commissioners: 'All our able-bodied labourers receive allowance.' No poor man in such parishes could save; if industrious and thrifty, and it was known that he had a fund of savings, 'he would be refused work till the savings were gone,' and he had come down to the pauper level. This had gone on, till in many places pauperism swallowed up three-fourths of the rent. Nor was the mal-administration confined to the rural districts; the evidence shewed that it extended all over the country, and into the manufacturing towns, where the out-door relief was a source of constant imposture. The administration of in-door relief was also full of abuses, from want of classification, discipline, and employment. Better food and lodging was provided for idle paupers than working-people could procure—better, even, than could be afforded by many of the ratepayers. In 1834, the commissioners reported that they found the administration 'opposed to the letter and spirit of the law, and destructive of the welfare of the community.' The commissioners strongly laid down the principle, that the condition of the pauper ought to be below the lowest condition of the independent labourer, because every penny bestowed in rendering the condition of the former more eligible than that of the latter, is a bounty on indolence and vice, and recommended: 1. The cessation of out-door relief; 2. A central authority to control the administration; 3. Unions for the better management of workhouses, and the classification of their inmates; and 4. A complete and clear system of accounts. The bill embodying these recommendations was brought in, March 17, 1834, passed its second reading in the House of Commons with only twenty dissenting votes, and became law on the 14th August as the 4th and 5th Will IV. c. 76. This act was not a change of law, but of administration. The orders of the new board restricted overseers, on the formation of a union, to the collection of rates; appointed paid relieving-officers to dispense relief under the directions of the unpaid Boards of Guardians; required the gradual withdrawal of out-door relief; and enforced classification and discipline in the workhouses. A rapid formation of unions took place under the new board. In the first eight months, 112 were formed out of 2066 parishes. The pauperised districts experienced a great and immediate relief, numbers of paupers going off when they found that relief involved adequate work, or the strictly-disciplined workhouse; wages rose, and the expenditure was reduced, on an average, 20 per cent. At the accession of George I. in 1714, the poor-rates amounted, as nearly as can be estimated, to £950,000, equal to 3s. 3½d. per head on the population of 5,750,000. At the accession of George III. in 1760, the population had increased to 7,000,000, the poor-rates to £1,250,000—an average of 3s. 6½d.; while in 1834, the population, estimated from the last census, was 14,372,000, and the money expended in relief, £6,317,255—equal to 8s. 9½d. per head. In three years, the operation of the Amendment Act had reduced the expenditure one-third, viz., to £4,044,741. In 1848, the commissioners were exchanged for a public board, which is one of the government departments, with a president, in whom has been

vested the power of the commissioners, and who holds office as one of the ministers of the crown. There are 631 unions. In 1860—1861, the number of poor receiving relief in England was about 850,000, about 4½ per cent. on the population: of these, about 140,000 were relieved in workhouses. The commissioners were unable to withdraw out-door relief, which continues to be in England the most important item. With the aged, the sick, and orphans, the guardians deal at their discretion; but stringent rules for the relief of the able-bodied are in operation under the board, whose orders have the force of laws. In the rural districts, guardians are prohibited from giving relief to the able-bodied out of the house, unless under a supplemental order, in emergency. For other places, the general rule forbids relief to be given in aid of wages, and requires work to be supplied. Exceptions are made by the board on the application of the unions when necessity arises, as in the recent case of the cotton districts. The expenditure is strictly guarded and examined by public auditors, of whom there are fifty-four for England. A district medical officer, of whom one or more are appointed for each union, attends to all cases of sickness among the poor.

Scotland and Ireland have been legislated for separately. Their poor-laws are similar to the English in principle and practice; both are administered by a Central Board, which supervises the local bodies charged with relief, and in both the rate is levied on the annual value of real property. The present system in Scotland was instituted by the 8th and 9th Vict. c. 83 (1845). Scotland is divided into 883 parishes, some of them combined for workhouse accommodation. The relief is administered by a parochial board, appointed by the ratepayers, the burgh magistrates, and the kirk-session. They appoint inspectors of the poor, who act as relieving-officers. The Scotch law differs from the English and Irish in allowing no relief to able-bodied adults. Claimants must be aged, infirm, or disabled. Out-door relief is the rule. Since the introduction of the poor-law system into Scotland, the extreme misery which formerly prevailed has been greatly modified, though with some sacrifice of that independence of feeling for which the humbler orders of Scotch were at one time celebrated. As regards the working of the Scottish poor-law, its great and acknowledged defect is the constant and costly contest respecting settlements, or right to fix claims on particular parishes; and so grievous has this become that some remedy would need to be applied. Scotland had in 1874 only 64 workhouses for 406 parishes (pop. 2,407,441). Ireland had no poor-laws until the year 1838, when they were introduced by the 1st and 2d Vict. c. 56. For the purpose of relief, Ireland is divided into 163 unions of townlands or parishes. Each union has a workhouse managed by a Board of Guardians, elected by the ratepayers. Every destitute person has an absolute right to relief, which is administered almost entirely in the workhouse. The average yearly population of the United Kingdom during the ten years ending 1870 was 29,694,138; average paupers in each year, 1,140,185, or 3·9 per cent. They were apportioned as follows:

	Population.	Paupers.	Percentage
England,	20,998,332	973,860	4·6
Scotland,	3,044,919	100,927	3·3
Ireland,	5,650,897	65,398	1·2

The total expenditure in the United Kingdom during the ten years' was 80,901,456, or an annual charge

of 5s. 5½d. per head on the average population of the period, apportioned as under:

	Amount of Assessment.	Per head per annum.
England and Wales,	£ 67,286,674	s. d. 6 4½
Scotland,	6,191,066	4 0½
Ireland,	7,423,716	2 7½

The rate, which in the year ending 25th March 1861, was 5s. 9d. per head on the population, amounted to £5,778,943, rose in 1862 to 6s. per head, amounting to £6,077,927, and in 1863, to 6s. 4½d., amounting to £6,527,036. The reports for these years shew that this increase was entirely due to the distress in the cotton manufacturing districts.

There is no poor-law in the Australian colonies, but benevolent asylums for the infirm and destitute have become general, and hospitals are numerous in all the rising towns in the gold-fields.—Compare Böckh's *Public Economy of Athens*, translated by Sir G. C. Lewis; M. Dureau de la Mall's *Economie Politique des Romains*; *Report of the International Statistical Congress* (1862); *Dictionnaire de l'Administration Française* (Paris, V. Berger-Levzault et Fils); Sir George Nichol's *History of the Poor-laws*; *Report of the Poor-law Commissioners* (1835); *Reports of the Poor-law Commission and Poor-law Board from 1835 to 1872*.

POOR, GENERAL LAWS AS TO. The fundamental rule as to the relief of the poor is, that each parish in England and Wales is bound to maintain its own poor. For the purpose of providing the requisite machinery, overseers are required to be appointed in each parish every year on the 25th March, or within a fortnight following; and these, along with the churchwardens, who are *ex officio* overseers, have the duty of providing the requisite funds. See **OVERSEERS**. This is done by means of a poor-rate, which the churchwardens and overseers may levy on all the occupiers of land in the parish, after such rate has been confirmed by the justices. The rate specifies a certain sum in the pound which is to be levied, and the annual value of the various lands is then specified, and the amount is thus easily computed. The rate is thus a local tax on the occupier of the land, and not on the owner, unless he himself is also occupier. In all cases, the duty of raising the funds attaches to the overseers; but the actual distribution and application of them are not always in their immediate control. Owing to the mischiefs arising from the officials of each parish distributing the funds at their discretion, without uniformity of plan, a central controlling power was created in 1834, in the shape of the Poor-law Board; and authority was given to combine various parishes into one poor-law union, for the purpose of greater uniformity as well as economy. When a union is formed, the control of the expenditure is chiefly vested in the guardians of this union, who are elected by each parish, and who supervise the management of the union workhouse. They order the overseers of each parish to raise their due proportion of funds, by a contribution order issued to such overseers, who are thereon bound to levy the amount by including it in the next poor-rate. The guardians are bound to contract for the provisions, clothing, fuel, &c., supplied to the workhouse, by means of sealed tenders, unless the quantity is less than a stated amount. They pay all the expenses of prosecutions for disobeying the orders of the Poor-law Board and kindred offences. The principle on which relief is administered to the poor is, that the condition of the pauper should not be so comfortable as that of the lowest independent labourer;

otherwise, idleness and imposture would be encouraged to an indefinite extent. The guardians profess only to relieve destitution already existing, and not to enable persons to keep off impending destitution. Hence they only supply the bare necessities of life. They cannot, for example, advance or lend money to set up a poor person in trade. Minute regulations are contained in the consolidated orders of the Poor-law Board as to the classification of paupers in the workhouse, mode of admission, diet, discipline, and out-door relief. With regard to out-door relief and able-bodied paupers, it is provided, that every able-bodied person requiring relief from any parish, shall be relieved wholly in the workhouse, together with his wife and family, if any, and if not otherwise employed. But the relief may be given out of doors in cases of sudden and urgent necessity, of sickness, accident, and a few other cases. In general, relief is confined to persons actually residing in some place within the union, except in case of casual destitution, or sickness and accident. Whenever out-door relief is given to an able-bodied person, half of it is to be in the form of articles of food or fuel. Relief is given only weekly, where the pauper is not required to be received into the workhouse. No relief is to be given to able-bodied persons while they are employed for wages or hire by any person; and every able-bodied male person, if relieved out of the workhouse, shall be set to work by the guardians, and kept so employed while he continues to receive such relief. The law with regard to the relief of the poor is so far qualified, that wherever a person applies for parochial relief, if he or she has a father or grandfather, mother or grandmother, or child, who is able to maintain such pauper, then the parish officers can obtain an order from justices to compel such relative to contribute a sum towards such maintenance. So husbands or fathers of paupers are bound to contribute to such maintenance. In all cases, the pauper is relieved either in the workhouse or out of the workhouse, according to the regulations of the poor-law orders. In some cases, the guardians or overseers may employ the poor in public works; but this is seldom done, except on occasions like the Lancashire distress. The law as to the settlement of the poor is somewhat intricate, and gives rise to much litigation. There are various grounds on which this settlement is acquired. Thus, every person has, *prima facie*, a settlement in the parish where he was born, until some other is proved; and there are so many other qualifications, that it is seldom a birth-settlement is resorted to. By marriage, a woman immediately acquires the settlement of her husband, if he has one, whether the husband be an Englishman or a foreigner. If the husband has no settlement, then the wife is thrown back on her maiden settlement. Formerly, a person acquired a settlement in a parish by hiring and service, and by residence for forty days under such hiring; but since 1834, no such settlement can be acquired. If any person shall be bound an apprentice by indenture, and reside forty days under such apprenticeship, he or she acquires a settlement thereby. So whoever shall rent a tenement in a parish, and actually occupy the same, and be rated to the poor for one whole year, the rent being not less than £10, and paid by the person so actually occupying the tenement, shall acquire a settlement. So a person acquires a settlement by acquiring an estate in land, however small in value, and residing forty days in the parish. So, if a person buy an estate, and the consideration amount to £30 at least, he shall thereby acquire a settlement. Formerly, a settlement was acquired by serving a public annual office, such as that of constable

overseer, &c.; but no settlement is now acquired on that ground. Unless a pauper has acquired a settlement on one or other of the grounds before mentioned in the parish or union where he receives relief, he is liable to be removed compulsorily to the parish where he last acquired a settlement. Certain persons, however, cannot be removed, and these are called irremovable paupers. Such are those paupers who have resided for three or more years in the parish or union in which they became destitute. The mode of computing these three years is, however, somewhat difficult in certain cases. While a pauper is irremovable, the expense of his relief is charged, not to the parish, but to the union fund. When a pauper is sought to be removed, it is necessary to take him before two justices of the peace for examination; and on proper evidence of his settlement, the justices will make the order of removal, which is an authority to the overseers to take or send the pauper to the overseers of the parish of settlement. If, however, the pauper is too ill at the time to admit of removal without danger, the justices may suspend the order of removal till he is recovered. Whenever a pauper is to be removed, the removing parish is bound to give notice to the parish of settlement; and it is on these occasions that so many obstinate and costly litigations take place as to which is the parish of settlement, for after a removal order, the costs of relief must be borne in future by the settlement parish. The latter parish may appeal to the Court of Quarter-sessions against the removal order; and the Quarter-sessions may state a case for the opinion of the Court of Queen's Bench, if any nice point of law should arise, as frequently happens.

In Scotland, there was no systematic provision for the relief of the poor until 1845, when the statute of 8th and 9th Vict. c. 83 was passed. By this statute, a central board (called the Board of Supervision) was established, which controls the parochial board of each parish or union of parishes in a manner similar to the Poor-law Board in England. A settlement can be acquired in Scotland by residence of five years. Children follow the settlement of their parents, and wives that of their husbands; and if no other settlement be proved, then the settlement of birth is liable. In Scotland, the mode of assessment differs from that in England, where only the annual value of lands and tenements can be rated in the hands of the occupier. The parochial board had the option of three modes of assessment: 1. One half to be paid by owners, and one half by the occupiers; 2. One half to be paid by owners of lands, and the other half to be paid by all the inhabitants, according to means and substance other than lands; 3. Assessing owners of lands and other inhabitants rateably according to their means and substance. But by a later act of 24th and 25th Vict. c. 37, the mode of assessing means and substance is abolished. It will thus be seen that in Scotland the poor-rate can never be imposed wholly on the occupier as it always is in England.

In Ireland, a Poor-law Act was also recently passed, and numerous amending statutes have followed, the code of laws being substantially found on the English acts.

There are special acts of parliament regulating the conditions on which paupers are removable between England, Scotland, and Ireland respectively.

POOR-RATE. See **POOR**; **OVERSEERS**.

POOR'S-ROLL, in the practice of the law of Scotland, means the list of poor persons who are litigants, but unable to pay the fees of court, and

therefore are allowed to sue *in formâ pauperis*. As this is considered a privilege, and enables the person to secure the services of counsel and agents gratuitously, it is only granted on production of a certificate by the minister of the parish and two elders, setting forth his circumstances to their own knowledge and his general poverty. Notice is given of this to the adverse party, who is allowed time to inquire and oppose the application. When the court is satisfied of the poverty, the next thing is for the court to remit the matter to the counsel for the poor, of whom there are always two annually appointed by the Faculty of Advocates, generally young counsel, for the purpose: one of these counsel reports whether there is a *probabilis causa*, i. e., a good cause of action. If this report is made, it is considered conclusive, and the party is put on the poor's-roll. This warrant remains in force for two years, and during that time, the pauper is exempt from all fees of court, and has the gratuitous services of counsel and agents. This provision for enabling paupers to carry on litigation, which is so complete in Scotland, is unknown in England or Ireland; for though a party may also be allowed there to sue *in formâ pauperis*, no provision is made by the court for giving him the gratuitous services of counsel and attorney; nevertheless, these sometimes volunteer to act gratuitously. See **IN FORMÂ PAUPERIS**.

POPAYAN, a city of the United States of Colombia (New Granada), South America, stands in a fertile plain, 6000 feet above sea-level, on the Cauca, in lat. 2° 27' N. It contains a cathedral and a number of conventual edifices. It was founded in 1537, and was the first city built by Europeans in this region. Under the Spaniards, it rose to considerable importance; but an earthquake in 1834, and the continued unsettled state of the country, have done much to reduce it. It is still of some consequence as a mart for agricultural produce. A great commercial road, about 1000 miles in length, leads from P. to Truxillo, in Peru. Pop. 20,000.

POPE (Gr. *papas*; Lat. *papa*, father), the title of the Bishop of Rome, and Supreme Pontiff of the Roman Catholic Church; applied also to all priests of the Greek and Russo-Greek Church. Under very many heads, occasions have arisen requiring reference more or less detailed to the authority and the privileges ascribed to the Bishop of Rome by the church of which he is the head. We propose in the present article to explain briefly the titles of the pope, the manner of his election, the nature and functions of his office, and the authority ascribed to him by the different schools of Catholics; and finally the chronological succession of the bishops of Rome from the earliest ages to our own day.

1. The name 'Papa' (q. v.)—the Latin equivalent of pope—was originally used of all bishops. The first known writer who applies it to the Roman bishop as his specific title, is Ennodius of Pavia, in the latter part of the 5th c., who thus addresses Pope Symmachus. It is used also by Cassiodorus; and thenceforward gradually came to be reserved to this application, but it did not lose entirely its old and general use for many centuries later. In the modern ecclesiastical vocabulary, the pope is called the 'Sovereign Pontiff,' the 'Vicar of Christ,' the 'Head of the Church,' the 'Holy Father,' &c. He subscribes himself, since St Gregory the Great, *Servus Servorum Dei* (Servant of the Servants of God); and he is addressed as Your Holiness, Your Beatitude, &c.

2. The office of pope is elective. The electoral body, according to the present usage, is the College of Cardinals. Primitively, the pope, as the other bishops, was elected by the clergy and people,

although the rights of both were not the same. In more than one instance, these elections were attended with violence, and even with blood, and the electoral body was by degrees limited. At length by a decree of Pope Nicholas II. in 1059, the right of election was vested in the cardinals. By the constitution of the College of Cardinals, provision was made for a representation of all the ancient electoral bodies; the cardinal bishops representing the bishops of the Roman synod, the cardinal priests representing the parish clergy, and the cardinal deacons representing the heads of the popular electoral districts (*regiones*) of the city. This constitution is the basis of the present electoral law. Preparatory to an election, the cardinals are shut up in what is called 'the conclave,' all communication with the outer world being interrupted until the election shall have been made. A simple majority of voices does not suffice—two-thirds of the cardinals must vote for the same candidate. There are four modes of election—'scrutiny,' 'access,' 'compromise,' and 'inspiration.' Twice each day during the conclave, the cardinals assemble, and each deposits, in a chalice placed on the altar, the name of his candidate. If the requisite number of votes are not found for any one, the papers are at once burned; and the smoke of the burning votes, which escapes through a small fine, is a signal to the expectant crowd outside that no election has taken place. This is called the 'scrutiny.' If votes be added to those already given for one candidate so as to make the required two-thirds, it is called 'access.' If the cardinals of two parties, finding that neither can hope to succeed, unite, it is called 'compromise.' If by a public movement, whether sudden or preconcerted, a particular candidate named be brought forward and carried as if by acclamation, the election is said to be by 'inspiration.' The present pope, Pius IX., was elected in this way. The greater Catholic powers—France, Austria, and Spain—were formerly understood to have the privilege, through one of their cardinals, of placing a veto upon the election of one candidate; but this right was of a very vague and undefined nature, and had no formal foundation in law. It is required by long usage, as a condition of election, that the candidate be an Italian, and that he be of mature age. Other considerations are also entertained. After election, the pope is enthroned, enters upon possession of his see, and finally, is solemnly crowned. The ceremonial of consecration is very splendid and deeply impressive. One of the ceremonies—that of burning a bunch of flax before him, with the words: 'Holy Father, thus passeth away the glory of the world!'—has often been cited for its highly symbolical character, as well as for its dramatic effect. Cardinals, in order to vote, must be present at the conclave—no voting by proxy is permitted.

3. The general nature of the office of the pope in the Roman Catholic system, and of the functions which it involves, may be inferred from the character which he is believed to hold in the church, as successor of St Peter, and vicerent of Christ on earth. He is therefore believed to be invested with all the powers necessary for the practical government of the church. Hence he is held (1) to possess over the entire church, and each of its parts, a supreme authority not indeed arbitrary, but regulated by the law of God and by the canons. He has power (2) to examine and decide authoritatively all controversies; (3) to convoke councils; (4) to revise and confirm their decrees; (5) to issue general decrees, whether upon discipline and morals, or upon doctrine; (6) he is the centre of communion, separation from which involves the forfeiture of

the communion of the whole church; (7) he has ultimate authority to appoint bishops in all parts of the church, and however this right may be exercised in the first instance, as by the sovereign, by the clergy, or by a synod of bishops, it rests with the pope to confirm the election, no matter how it may have been made, and to grant 'canonical institution;' (8) he can also deprive bishops, and set others in their place; and can even, in cases of great emergency, suppress bishoprics, and change their ecclesiastical limits according to his judgment of the existing requirements of the church; (9) he has authority to judge of the doctrines taught in particular books, or by particular individuals, and to pronounce infallibly as to their conformity with the Catholic faith, or the contrary. This privilege formed the subject of the great controversy with the Jansenists as to what are called 'Dogmatic Facts.'

4. All Catholics are agreed that the pope, as primate, possesses, by divine law and in virtue of his office, full governing authority over the entire church. Of the exercise of such power, they find traces in history from the earliest times. Roman Catholic historians trace the history of the pope's primacy in St Clement's Letters to the Church of Corinth, in the action taken by Victor in the Paschal controversy, and by Stephen and Cornelius in the controversy on re-baptising heretics; in the deposition of Marcian, Bishop of Arles, at the instance of Cyprian, by Pope Stephen; in the leading part taken by the popes in the condemnation of Donatus and of the Pelagian heresy; and perhaps more than all, in the appeals made from various parts of the church by persons excommunicated by their own bishops, and the rehearing at Rome of such causes, and the confirmation or reversal of the sentence according to the result of the trial. These several facts, however, although to Catholics they appear evidences of the papal supremacy, are explained by Protestant writers in a sense which does not suppose any permanent supremacy on the part of the Roman See, and which they hold to be reconcilable with the full independence of national churches; and it is admitted by Catholics themselves, while they contend that the instances to which they appeal imply a real exercise of primacy from the beginning, that the details of that primacy have undergone a gradual and extensive development in the progress of the church. Great difference of opinion exists between the Gallican and the Ultramontane schools as to the extent and nature of the papal authority, whether in decrees of doctrine or in the government of the church. As regards doctrinal decrees, all are agreed that the judgment of the pope, in concert with the body of bishops, is infallible; but they differ as to papal decrees on doctrine issued by the pope alone, *ex cathedra*, and addressed to the whole church. See GALLICANISM. On certain points, however, both schools agree; both are agreed, for instance, as to the duty of respectful obedience on the part of all, until the general sense of the church shall have been ascertained; and should no reclamation on the part of the church take place, the decree of the pope is, in the opinion of both schools, to be received as infallible, and the doctrine propounded therein is to be held as of faith. But the Ultramontanes go beyond the Gallicans in holding this from the very moment of the decree's being issued *ex cathedra*, and independently of any reference to the church dispersed. As to the government of the church, the Ultramontanes hold the pope to be supreme, and thus to be superior to general councils, and independent of their decrees. The Gallicans, on the contrary, hold that a general council is superior to the pope, and has power to

bind him by its decrees. Further, the Ultramontanes hold that the pope is the source of all jurisdiction in the church, and that the bishops derive their powers *through him* from Christ. The Gallicans regard the episcopal power as received directly from Christ by virtue of the episcopal office. This difference of opinion leads to many controversies of detail as to the respective rights and powers of the pope and the bishop in the several dioceses, regarding which it is only necessary to indicate the general ground of difference of opinion.

5. The chronology of the papacy in the 1st c. is very obscure. The enumerations in the ancient writers are imperfect, and they differ as to the exact order of succession. The two most ancient catalogues, those of Irenæus and Augustine, differ in more than one particular. The chief difficulty regards Linus and Cletus. The former is believed to have been the vicegerent of Peter during the interval between his first coming to Rome and his final residence there. He would therefore have been at once the contemporary of Peter and his successor (though but for a very brief period). The difficulty as to Cletus arises from the doubt whether he be the same person with Anacletus. We subjoin a catalogue drawn up after the most careful modern authorities, and arranged according to centuries:

	FIRST CENTURY.	A.D.
St Peter,		41-67
Linus,		68
Cletus, or Anacletus,		uncertain date
Clement I.,		uncertain date

	SECOND CENTURY.	
Evaristus,		about 100
Alexander I.,		about 109
Sixtus I., Roman,		119
Telesphorus, Greek,		127
Hyginus, Athenian,		138
Pius I., native of Aquileia,		142
Anicetus, Syrian,		151
Soter, Greek,		161
Eleutherus, Greek,		170
Victor I., African,		185
Zephyrinus,		197

	THIRD CENTURY.	
Callixtus I., Roman,		217
Urban I., Roman,		222
Pontianus, Roman,		230
Antherus, Greek,		235
Fabianus, probably Roman,		236
Cornelius, Roman,		252
(Novatianus, first antipope.)		
Lucius I., Roman,		253
Stephen I., Roman,		258
Sixtus II., Roman,		257
Dionysius, Greek,		259
Felix I., Roman,		270
Eutychianus, uncertain,		275
Caius, Roman,		283
Marcellinus, Roman,		296

	FOURTH CENTURY.	
Marcellus I., Roman,		308
(Marcellinus having died in 304 or 305.)		
Eusebius, Greek,		310
Melchisedes, African,		310
Sylvester I., Roman,		314
Marcus, Roman,		336
Julius I., Roman,		337
Liberius, Roman,		352
(Felix II., antipope.)		
Damasus I., Spaniard,		366
(Ursicinus, antipope.)		
Silricus, Roman,		384
Anastasius I., Roman,		398

	FIFTH CENTURY.	
Innocent I., native of Albano,		401
Zosimus, Greek,		417
Boniface I., Roman,		418
Celestinus I., Roman,		422
Sixtus III., Roman,		432
Leo I., Roman, call d 'the Great,'		440
Hilarius, native of Sardinia,		461
Simplicius, native of Tibur,		467

Felix III., Roman,	483
Gelasius I., Roman,	492
Anastasius II., Roman,	496
Symmachus, native of Sardinia,	498

	SIXTH CENTURY.	
Hormisdas, native of Frusino,		514
John I., Tuscan,		522
Felix IV., native of Beneventum,		526
Boniface II., Roman,		530
John II., Roman,		532
Agapetus I., Roman,		535
Sylvester, native of Campania,		536
Vigilius, Roman,		540
Pelagius I., Roman,		555
John III., Roman,		560
Benedict I., Roman,		574
Pelagius II., Roman,		578
Gregory I., Roman, styled 'the Great,'		590

	SEVENTH CENTURY.	
Sabinianus, native of Tuscany,		604
Boniface III., Roman,		607
Boniface IV., native of Abruzzi,		608
Deusdedit or Deodatus I., Roman,		615
Boniface V., Neapolitan,		619
Honorius I., native of Capua,		625
Severinus, Roman,		638
John IV., native of Dalmatia,		640
Theodorus I., Greek,		641
Martin I., native of Tudertum,		649
Eugenius I., Roman,		654
Vitalianus, native of Signia,		657
Deusdedit II., Roman,		672
Domnus I., Roman,		676
Agathon, Sicilian,		678
Leo II., Sicilian,		682
Benedict II., Roman,		684
John V., native of Syria,		685
Conon, native of Thrace,		686
Sergius I., native of Palermo,		687

	EIGHTH CENTURY.	
John VI., native of Greece,		701
John VII., native of Greece,		705
Sisinius, native of Syria,		708
Constantine, Syrian,		709
Gregory II., Roman,		715
Gregory III., Syrian,		731
Zacharias, Greek,		741
Stephen II.,		753
Stephen III., Roman,		753
Paul I., Roman,		757
Stephen IV., Sicilian,		763
Adrian I., Roman,		772
Leo III., Roman,		795

	NINTH CENTURY.	
Stephen V., Roman,		816
Paschal I., Roman,		817
Eugenius II., Roman,		824
Valentinus, Roman,		827
Gregory IV., Roman,		827
Sergius II., Roman,		843
Leo IV., Roman,		847

In this interval is placed the fabulous pope Joan (q. v.).		
Benedict III., Roman,		855
Nicholas I., Roman,		858
Adrian II., Roman,		867
John VIII., Roman,		872
Martin II. (called also Marinus I.),		882
Adrian III., Roman,		884
Stephen VI., Roman,		885
Formosus, Bishop of Porto,		891
(Sergius and Boniface VI., antipopes.)		
Stephen VII., Roman,		896
Romanus, Tuscan,		897
Theodorus II., Roman,		897
John IX., native of Tibur,		897

	TENTH CENTURY.	
Benedict IV., Roman,		900
Leo V., native of Ardea,		903
(Christopher, antipope.)		
Sergius III.,		904
Anastasius III., Roman,		911
Lando, native of Sabina,		913
John X., Roman,		914
Leo VI., Roman,		928
Stephen VIII., Roman,		929
John XI.,		931
Leo VII., Roman,		936
Stephen IX., Roman,		939
Martin III. (called by some Marinus II.),		943
Agapetus II.,		948

John XII., Ottaviano Conti, He was the first who changed his name on his elevation. (Leo VIII., antipope.)	956 963
Benedict V., Roman.	964
John XIII., Roman.	965
Benedict VI.,	972
Domnus II., Roman.	973
Benedict VII. (Conti), Roman.	974
John XIV.,	983
(Boniface VII., Franco, antipope.)	
John XV., Roman.	985
John XVI., Roman.	986
Gregory V., German.	996
Silvester II., Gerbert, native of Auvergne.	999

ELFTH CENTURY.

John XVII. (May—October),	1003
John XVIII., Roman.	1003
Sergius IV., Roman.	1009
Benedict VIII., native of Tusculum.	1012
John XIX., Roman (in some catalogues reckoned XX.; the diversity arising from a disputed election).	1024
Benedict IX.,	1033
(Sylvester, antipope.)	
Gregory VI., Roman.	1044
Clement II., native of Saxony.	1047
Damasus II. (Poppo),	1048
Leo IX., Bishop of Toul.	1049
Victor II., Bishop of Eichstadt.	1055
Stephen X., Fredrick, Abbot of Monte Casino.	1057
Benedict X., by some styled antipope, abdicated.	1058
Nicholas II., native of Burgundy.	1059
Alexander II., native of Milan.	1061
Gregory VII., Hildebrand, native of Tuscany. (Guibert, antipope, assumed the name of Clement III.)	1073
Urban III., native of Beneventum.	1086
Urban II., native of France.	1088
Pascal II., native of Tuscany. (Albert and Theodoric, antipopes.)	1099

TWELFTH CENTURY.

Gelasius II., native of Caieta.	1118
Callixtus II., native of Burgundy.	1119
Honorius II., Cardinal Lambert, Bishop of Ostia.	1129
Innocent II., Roman. (Anacletus, antipope.)	1130
Celestinus II., Tuscan.	1143
Lucius II., native of Bologna.	1144
Eugenius III., native of Pisa.	1145
Anastasius IV., Roman.	1153
Adrian IV., Nicholas Breakspere, Englishman.	1154
Alexander III., Cardinal Orlando Bandinelli, native of Siena. (Victor, Paschal, and Callixtus, antipopes.)	1159
Lucius III., Cardinal Ubaldo of Lucca.	1181
Urban III., Uberto Crivelli, Archbishop of Milan.	1185
Gregory VIII., native of Beneventum.	1187
Clement III., Paul, Bishop of Præneste.	1188
Celestinus III., Cardinal Hyacinthus, Roman.	1191
Innocent III., Cardinal Lotharius, native of Signa.	1198

THIRTEENTH CENTURY.

Honorius III., Cardinal Savelli, native of Rome.	1216
Gregory IX., Cardinal Hugo, native of Anagni.	1227
Celestinus IV., native of Milan.	1241
Innocent IV., Cardinal Sinibaldo Fieschi, native of Genoa.	1242
Alexander IV., Cardinal Rinaldo Conti, native of Anagni.	1254
Urban IV., James, Patriarch of Jerusalem, Frenchman.	1261
Clement IV., Guy, native of St Gilles, in Languedoc.	1265
Gregory X., Tebaldo Visconti, native of Piacenza.	1272
Innocent V., Cardinal Peter, native of Tarentaise.	1276
Adrian V., Ottobono Fieschi, native of Genoa.	1276
John XXI., native of Lisbon.	1276
Nicholas III., Cardinal Orsini, native of Rome.	1277
Martin IV., Cardinal Simon de Brie, Frenchman.	1281
Honorius IV., Cardinal James Savelli, native of Rome.	1285
Nicholas IV., Cardinal Jerome, native of Ascoli.	1288
Celestinus V., Pietro da Morrone of Abruzzi.	1294
Boniface VIII., Cardinal Benedetto Gaetani, native of Anagni.	1295

FOURTEENTH CENTURY.

Benedict XI., Cardinal Nicholas, native of Treviso.	1303
Clement V., Bertrand of Bordeaux, removed the papal see to Avignon.	1305
John XXII., James, native of Cahors, in France. (Nicholas, antipope.)	1316
Benedict XII., James Fournier, Frenchman.	1334
Clement VI., Peter Roger, native of Limoges, in France.	1342
Innocent VI., Stephen Aubert, native of Limoges.	1352
Urban V., William Grimoard, Frenchman.	1362
Gregory XI., Peter Roger, Frenchman, restored the papal see to Rome.	1370

Urban VI., Bartolomeo Prignano, Neapolitan. (From 1378 to 1410 occurs the great Western Schism, during which, in conflict with the line of popes inserted in the catalogue, is found a rival line residing at Avignon —Clement VII., 1378—1394; Benedict XIII., 1394—1410. The Council of Pisa, 1410, deposed both rival popes; but Benedict XIII. remained in schism till his death in 1424.)	1378
Boniface IX., Peter Tomacelli of Naples.	1389

FIFTEENTH CENTURY.

Innocent VII., Cosmo Migliorati, native of Sulmona.	1404
Gregory XII., Angelo Corradi, native of Venice.	1406
Alexander V., Peter Philargius, native of Candia.	1409
John XXIII., Cardinal Cossa, deposed by the Council of Constance.	1410
Martin V., Otto Colonna, Roman.	1417
Eugenius IV., Gabriel Condulmero, Venetian. (Felix, antipope.)	1431
Nicholas V., Cardinal Thomas, native of Sarzana.	1447
Callixtus III., Alfonso Borgia, Spaniard.	1455
Pius II., Aeneas Sylvius Piccolomini, native of Siena.	1458
Paul II., Peter Barbo, native of Venice.	1464
Sixtus IV., Francis della Rovere, Genoese.	1471
Innocent VIII., Gian Battista Cibo, Genoese.	1485
Alexander VI., Rodrigo Lenzioli Borgia, Spaniard.	1492

SIXTEENTH CENTURY.

Pius III., Francis Todeschini Piccolomini.	1503
Julius II., Julian della Rovere, Genoese.	1503
Leo X., Giovanni de' Medici, son of Lorenzo the Magi- ficent.	1513
Adrian VI., native of Utrecht.	1522
Clement VII., Giulio de' Medici, nephew of Lorenzo.	1523
Paul III., Alessandro Farnese, native of Rome.	1534
Julius III., Giovan Maria Giocci, native of Rome.	1550
Marcellus II., Cardinal Cervini, native of Montepulciano.	1555
Paul IV., Gianpietro Caraffa, Neapolitan.	1555
Pius IV., Giovanni Angelo Medici, native of Milan.	1559
Pius V., Michele Ghislieri, native of Alessandria.	1566
Gregory XIII., Hugo Buoncompagni, native of Bologna.	1572
Sixtus V., Felice Peretti of Montalto, native of the March of Ancona.	1585
Urban VII., Gian Battista Castagna, Genoese.	1590
Gregory XIV., Nicola Sirodanti, native of Milan.	1590
Innocent IX., Gian Antonio Facchinetti, native of Bologna.	1591
Clement VIII., Ippolito Aldobrandini, native of Fano.	1592

SEVENTEENTH CENTURY.

Leo XI., Alessandro de' Medici, native of Florence.	1605
Paul V., Camillo Borghese, native of Rome.	1605
Gregory XV., Alessandro Ludovici, native of Bologna.	1621
Urban VIII., Maffeo Barberini, Florentine.	1623
Innocent X., Gian Battista Pamfili, native of Rome.	1644
Alexander VII., Fabio Chigi, native of Siena.	1655
Clement IX., Giulio Rospigliosi, native of Pistola.	1667
Clement X., Emilio Altieri, native of Rome.	1670
Innocent XI., Benedetto Odescalchi, native of Como.	1676
Alexander VIII., Pietro Ottoboni, native of Venice.	1689
Innocent XII., Antonio Pignatelli, native of Naples.	1691

EIGHTEENTH CENTURY.

Clement XI., Gian Francesco Albani, native of Urbino.	1706
Innocent XIII., Michael Angelo Conti, native of Rome.	1721
Benedict XIII., Vincenzo Maria Orsini, native of Rome.	1724
Clement XII., Lorenzo Corsini, native of Florence.	1730
Benedict XIV., Prospero Lambertini, native of Bologna.	1740
Clement XIII., Carlo Rezzonico, native of Venice.	1758
Clement XIV., Gian Vincenzo Ganganelli, born near Rimini.	1769
Pius VI., Angelo Braschi, native of Cesena.	1775

NINETEENTH CENTURY.

Pius VII., Gregorio Barnaba Chiaramonti, native of Cesena.	1800
Leo XII., Annibale della Genga, native of Romagna.	1823
Pius VIII., Cardinal Castiglioni, native of Cingoli.	1829
Gregory XVI., Mauro Cappellari, native of Belluno.	1831
Pius IX., Giovanni Maria Mastai-Feretti, Sinigaglia.	1846
Leo XIII., Joachim Pecci, Carpineto.	1878

Protestants generally object to the list of popes given by Roman Catholics, that there is no absolutely conclusive evidence of the apostle Peter's ever having been at Rome; although most of them admit the probability that he was there, and suffered martyrdom there. But they deny that there is any evidence whatever of his having exercised the office of bishop either there or anywhere else. They call in question many other of the names and dates in the earlier part of the list, not so much disputing the existence of the persons named, as their exercise of the office of bishop in

Rome, and still more their right to be considered bishops of Rome. According to Protestants in general, the papacy grew by a gradual assumption of power out of an ordinary bishopric, through the advantage of metropolitan position and influence, and was afterwards supported by the fable—as they deem it—of the see of St Peter.

POPE. See RUFFE.

POPE, ALEXANDER, an eminent English poet, was born in London, May 21, 1688. His parents were Roman Catholics, and to this faith the poet also nominally adhered, thus debarring himself from public office and employment. His father, a linen-merchant, saved a moderate competency, and received some accession of fortune by his marriage with Edith Turner, his second wife, and the poet's mother, a lady of a good Yorkshire family. He then withdrew from business, and settled on a small estate he had purchased at Binfield in Windsor Forest. He died at Chiswick, in 1717. His son shortly afterwards took a long lease of a house and five acres of land at Twickenham, on the banks of the Thames, whither he retired with his widowed mother, to whom he was tenderly attached, and where he resided till his death, cultivating his little domain with exquisite taste and skill, and embellishing it with a grotto, temple, wilderness, and other adjuncts poetical and picturesque. In this famous villa, P. was visited by Frederick, Prince of Wales, and by the most celebrated wits, statesmen, and beauties of the day, himself being the most popular and successful poet of his age. P.'s early years were spent at Binfield, within the range of the Royal Forest. He received some education at little Catholic schools, but was his own instructor after his twelfth year. He never was a profound or accurate scholar, but he read the Latin poets with ease and delight, and acquired some Greek, French, and Italian. He was a poet almost from infancy; he 'lisp'd in numbers,' and when a mere youth, surpassed all his contemporaries in metrical harmony and correctness. His pastorals and some translations appeared in Tonson's *Miscellany*, in 1709; but were written three or four years earlier. These were followed by the *Essay on Criticism*, 1711; *Rape of the Lock* (when completed, the most graceful, airy, and imaginative of his works), 1712—1714; *Windsor Forest*, 1713; *Temple of Fame*, 1715. In a collection of his works printed in 1717, he included the *Epistle of Eloisa*, and *Elegy on an Unfortunate Lady*, two poems inimitable for pathetic beauty and finished melodious versification. From 1715 till 1726, P. was chiefly engaged on his translations of the *Iliad* and *Odyssey*, which, though wanting in true Homeric simplicity, naturalness, and grandeur, are splendid poems. They realised to the fortunate and fashionable translator a sum of about £8000. He next edited an edition of Shakspeare, which proved unworthy of his reputation. In 1728—1729, he published his greatest satire—the *Dunciad*, an attack on all poetasters and pretended wits, and on all other persons against whom the sensitive poet had conceived any enmity. In 1737, he gave to the world a volume of his *Literary Correspondence*, containing some pleasant gossip and observations, with choice passages of description; but it appears that the correspondence was manufactured for publication, not composed of actual letters addressed to the parties whose names are given, and the collection was introduced to the public by means of an elaborate stratagem on the part of the scheming poet. Between the years 1731 and 1739, he issued a series of poetical essays, moral and philosophical, with satires and imitations of Horace, all admirable

for sense, wit, spirit, and brilliance. Of these delightful productions, the most celebrated is the *Essay on Man*, to which Bolingbroke is believed to have contributed the spurious philosophy and false sentiment; but its merit consists in detached passages, descriptions, and pictures. A fourth book to the *Dunciad*, containing many beautiful and striking lines, and a general revision of his works, closed the poet's literary cares and toils: he died on the 30th of May 1744, and was buried in the church at Twickenham. P. was of very diminutive stature, and deformed from his birth. His physical infirmity, susceptible temperament, and incessant study, rendered his life 'one long disease.' He was, as his friend, Lord Chesterfield, said, 'the most irritable of all the *genus irritabile vatum*, offended with trifles, and never forgetting or forgiving them.' His literary stratagems, disguises, assertions, denials, and (we must add) misrepresentations, would fill volumes. Yet P., when no disturbing jealousy, vanity, or rivalry intervened, was generous and affectionate, and he had a manly, independent spirit. As a poet, he was deficient in originality and creative power, and thus was inferior to his prototype, Dryden; but as a literary artist, and brilliant declaimer, satirist, and moraliser in verse, he is still unrivalled. He is the English Horace, and will as surely descend with honours to the latest posterity.

PO'PERY literally means attachment to the religion or to the party of the pope; and in this sense the word is synonymous with the profession of the Roman Catholic religion. In its use, however, it has come to involve the idea of contempt or disparagement. It may therefore be said, that the word is either intended to designate what are regarded by Protestants as the most exaggerated and superstitious among the doctrines and practices which they ascribe to Catholics, in contradistinction to the belief of the more moderate members of that church, or is designedly employed as an expression of contempt and depreciation.

POPISH PLOT, the name given to an imaginary plot on the part of the Roman Catholics in England during the reign of Charles II., the object of which was believed to be a general massacre of the Protestants. See OATES, TITUS.

PO'PLAR (*Populus*), a genus of trees, forming, along with willows, the whole of the natural order *Salicaceæ* or *Salicinæ* (by some regarded as a sub-order of *Amentaceæ*), and having dioecious flowers arranged in catkins, both male and female flowers with an oblique cup-shaped perianth. The seeds have silky hairs, as in willows, and are readily wafted about by the wind. The species are numerous, chiefly natives of the temperate and cold regions of the northern hemisphere. They are large trees of rapid growth, with soft wood; and broad, heart-shaped, ovate, triangular, or lozenge-shaped, deciduous leaves, on rather long stalks. Many of them are very beautiful trees. The catkins appear long before the leaves, and proceed from distinct lateral buds. Few of the poplars are of much value for their timber, which is generally white, soft, and light; but from their rapid growth, they are useful as yielding firewood, where the scarcity of other fuel renders it necessary to plant trees for this purpose, and they are often planted as ornamental trees, producing an immediate effect of embellishment in a bare situation more readily than almost any other kind of tree. Besides the species known by the name Aspen (q. v.), or Tremulous Poplar, the following seem the most worthy of notice. The WHITE P., or ABELE (*P. alba*), a native of the southern parts of Europe, is often planted, but as

it spreads rapidly from the roots, is not desirable in lawns. It rises to 60—80 feet, with a fine spreading head and roundish, heart-shaped, lobed, and toothed leaves, which are smooth, shining, dark-green above, downy and silvery-white beneath. The wood is used by cabinet-makers, turners, and toy-makers. It is little liable to swell or shrink, which adapts it for various purposes. The tree loves low situations and clay soils. This tree has of late years suffered in Britain from some unknown cause, like the potato, dying where it previously flourished; whilst other poplars, the most nearly allied, continue to flourish in the same localities.—The GRAY P. (*P. canescens*) is very similar to the White P., but of more vigorous growth, a large spreading tree; the leaves similar to those of the White P., but not so dark-green above or so white beneath. It is not of so rapid growth as the White P.; and its wood is harder and better, makes good flooring, and is preferable to pine-deal for the neighbourhood of fireplaces, being less apt to take fire; it is also used for coarse doors, carts, barrows, &c., and not being liable to warp, is esteemed by wood-carvers. The tree generally begins to rot in the heart when forty or fifty years old. Like most of the other poplars, it fills the ground around it with suckers. Like the White P., it is a very doubtful native of Britain, and belongs to the centre and south of Europe.—The BLACK P. (*P. nigra*), a native of most parts of Europe, and perhaps of England, is a tree of 50—80 feet high, with an ample spreading head, viscous leafbuds, and deltoid or unequally quadrangular, perfectly smooth leaves. The wood is used for the same purposes as

Black Poplar (*P. nigra*).

that of the White and Gray Poplars. The 'cotton' from the seeds has been used in France and Germany for making cloth hats and paper, but these uses of it were not found profitable.—The LOMBARDY P. (*P. fastigiata* or *dilatata*) is perhaps a mere variety of the Black P., with erect instead of spreading branches. It appears to have been introduced into Europe from the East. It is very common in the Punjab and in Persia, and now also in Lombardy and other parts of Italy. It attains a height of 100, or even 150 feet, and is remarkable for its erect form, contracted head, and very rapid growth. It is not now planted in America as an ornamental tree, though esteemed during the last century, when it was thought preferable for

ornamental purposes to every other tree. It is common in the streets and squares of towns in all parts of Britain; and is particularly adapted to

Lombardy Poplar (*P. fastigiata*).

situations where a long horizontal line of any kind fatigues the eye, or as seen starting up from a mass of lower wood or shrubbery, but has a besom-like appearance when planted in unsuitable situations. The wood is of almost no value. It is generally propagated by layers.—The species commonly known as COTTON-WOOD or NECKLACE POPLAR (*P. monilifera*), is a native of North America, especially of the Western States, though it is found in New England. The female catkins of this species resemble a string of pearls. It is planted in England, both as an ornamental tree and for the sake of its timber, which is useful for flooring, &c. The leaves are deltoid. It is of very rapid growth, and attains a height of 100—120 feet.—The BALSAM P., or TACAMAHAC (*P. balsamifera*), a very common ornamental tree in Britain, is a native of North America and of Siberia, and has whitish ovate-oblong leaves, which in spring are of a delicate yellow tint, and have an agreeable fragrance. The leaf-buds are viscid. The erect fastigate manner of growth approaches that of the Lombardy Poplar. The resinous exudation of the buds (*Tacamahac*) is said to be diuretic and antispasmodic; and an ointment made from the buds is used for tumours, wounds, and burns. The resinous exudation of the buds of other species, as the Black P., possesses similar properties.—The AMERICAN ASPEN (*P. tremuloides*), and LARGE-TOOTHED ASPEN (*P. grandidentata*), attain to a height of 20—50 feet. They have long, slender leaf-stalks, laterally compressed, which permit the continual agitation of the foliage by the slightest breeze.—ONTARIO P. (*P. canadensis*), a variety with the same balsamic character as *P. balsamifera*, and chiefly distinguished from it by its larger leaves. In size of leaf, no other species equals *P. heterophylla*, a native of the Southern States of North America, the leaves of which are often six inches long. *P. heterophylla*, or DOWNY-LEAVED POPLAR, is a large tree found from N. England to Illinois and southward.

PO'PLIN (Fr. *papeline*). In the 15th c., a fabric was woven in Avignon called *papeline*, which was made of silk, and was much esteemed. An attempt to imitate it was introduced into England, and the name was corrupted to *poplin*, which has been adopted abroad as well as at home. In 1775, the manufacture was introduced to Ireland by French

Protestant refugees, and from that time to the present, Irish poplins have been famous. What the exact nature of the original *papelines* was, is not certainly known; but the best modern poplins consist of a warp of silk and a weft of worsted, which gives substance, combined with great softness and elasticity, to the material. Cotton, and even flax yarns are substituted for silk, wholly or partially, in making cheap goods, but they are very far inferior in beauty to the true poplins.

POPO'CATEPETL (Aztec, *popoca*, to smoke, and *tepetl*, a mountain), or in Spanish, *Volcan Grande de Mexico*, Grand Volcano of Mexico, a mountain about 10 miles south-west of the city of Mexico. It rises in the form of a cone to a height of 17,720 feet above the sea-level, and is composed chiefly of porphyritic obsidian. Forests girdle its lower parts; but at an elevation of 13,000 feet, all vegetation ceases. About the period of the Spanish conquest, it was very active, but no eruption has been recorded since 1540. It still smokes, however. Cortes, the conqueror of Mexico, attempted to reach its summit, but was unable to do so, on account of the masses of snow that covered it. This feat was first achieved by Francisco Mantaño, one of Cortes's followers, who not only climbed to the top of the mountain, but had himself let down its crater, by means of ropes, to a depth of about 450 feet. In 1827, it was again scaled by the brothers Glennie, who determined its altitude barometrically, and since then, this laborious exploit has been several times performed.

PO'PPINJAY, a name of the Green Woodpecker (*Picus viridis*), a bird common in most of the wooded districts of England and Scotland. See **WOOD-PECKER**.

PO'PPY (*Papaver*), a genus of plants of the natural order *Papaveraceæ*, having a calyx of two (or rarely three) sepals, which very soon fall off; a corolla of four (rarely six) petals; numerous stamens seated on a receptacle; the stigma crowning the germen, without a style, and in the form of 4–20 rays; the capsule opening by pores under the persistent stigma, imperfectly divided into cells by partitions as numerous as the rays of the stigma, but which do not reach the centre, the seeds extremely numerous. There are numerous species of P., mostly natives of Europe and Asia, some of them found even in very northern regions, but most of them in the warmer temperate parts. They are rather large herbaceous plants, annual or perennial, mostly sprinkled with bristly hairs. They have a white milky juice; a disagreeable narcotic smell, particularly when bruised; pinnatifid or bipinnatifid leaves, more rarely jagged or toothed leaves; and large showy flowers, which readily become double by cultivation. The capsules are curious from the manner in which they fling out their seeds when the plant is shaken by the wind; each capsule being somewhat like a round or oval pepper-box, with holes, however, not in the top, where rain might get in by them, but under the rim. By far the most important species is that known as the **OP'PIUM P.** (*P. somniferum*), also called the **WHITE P.**, and the **OIL POPPY**. See **OP'PIUM**. But the same species is important on account of the bland fixed oil of the seeds, and is much cultivated as an oil-plant. *P. oil* is as sweet as olive oil, and is used for similar purposes. It is imported into Britain in considerable quantities from India. The P. is also extensively cultivated for it in France, Belgium, and Germany. The use and manufacture of this oil were for a long time, during last century, strictly prohibited in France, from a mistaken notion that it must partake of the narcotic

properties of the milky juice of the plant. The seed, however, contains no opium or any narcotic principle, and was well known to the ancients as a pleasant article of food, fit to be eaten by itself or with bread. The oil expressed from it is perfectly wholesome, and is much used in France and elsewhere as an article of food. Fully one-half of the oil used for cooking and otherwise for alimentary purposes in France, is of this kind. The seeds yield about 40 per cent. of oil, and the oil-cake is useful for manure or for feeding cattle. The oil is sometimes used by painters and by soap-boilers; but it is not good for burning. In the cultivation of the P. for oil, the seed is often sown in autumn, where the severity of winter-frosts is not to be feared; in more northern parts, it is sown in spring, and sometimes the seed is scattered on the top of the snow with which the ground is covered. Being very small, it needs little or no harrowing. Early sowing is favourable to the size of the plant, and the abundance of produce. Hoeing and thinning are advantageous. An open but rich soil is best for the P.; and a sheltered situation is necessary, as in exposed situations, much of the seed is scattered by the wind. The P. does not exhaust the land so much as colza, rape, and some other oil-plants. Harvesting ought to begin when one-fourth of the capsules of each plant are open. It is accomplished by pulling the plants in such a manner as not to shake the seed out of the capsules, and tying them in sheafs, which are placed together in an erect or slightly sloping position, till the ripening of the capsules is completed, when the seed is taken out by shaking the capsules into a tub or on a cloth, great care being used to prevent any earth from the roots from getting mixed with them. Some farmers in Flanders sow P. in alternate rows with carrots. The variety of P. chiefly cultivated as an oil-plant has flowers of a dull reddish colour, large oblong capsules, and brownish seeds; but the white-flowered variety, with globular capsules and white seeds, is also used.—The **ORIENTAL P.** (*P. orientale*), a native of Armenia and the Caucasus, a perennial species, is often planted in gardens on account of its very large, fiery-red flowers. Its unripe capsules have an acrid, almost burning taste; but are eaten by the Turks, and opium is extracted from them.—Several species are British, all of them local, rare in some places, and troublesome weeds in cornfields in other places apparently quite similar in climate. Among them is the **CORN P.** or **COMMON RED P.** (*P. rhoeas*), with bright red flowers, and deeply pinnatifid leaves. The petals are mucilaginous and slightly bitter; they have a slight narcotic smell; and a syrup made of them is sometimes used as an anodyne in catarrhs and children's complaints; but they are more valued for the rich red colour which they yield. A variety with double flowers is cultivated in flower-gardens, under the name of **Carnation Poppy**. Among the ancients, the P. was sacred to Ceres.

POPPY-HEAD, a carved ornament, used as a finial on top of bench-ends, &c. In early examples, it is a simple fleur-de-lis, but in late Gothic, this and other wood-work become very elaborately carved.

Poppy-head.

PORBEAGLE (*Lamna Cornubica*, or *Isurus Cornubicus*), a fish of the Shark family (*Squalidae*), not uncommon on the British coasts. It has two dorsal fins, the first about the middle of the back, the second near the tail. The tail-fin is large and forked. The head is pointed. The gill-openings are large. The teeth are flat, triangular, smooth, sharp, and cutting. The P. is also called the **BEAUMARIS SHARK**. It attains a length of about six feet. Small companies associate in pursuit of prey, which consists of fish of various kinds. No creature is more voracious; three large hakes have been found in the stomach of a porbeagle.

PORCELAIN. See **POTTERY AND PORCELAIN.**

PORCH, a building forming an enclosure or protection for a doorway. Every one knows how much this beautiful feature is now used, and how efficient it is as a protection from the wind and weather. In Elizabethan and medieval architecture, the porch was also very common in domestic architecture. In churches, it was almost universal in this country. In France, many splendid porches or portals remain; they are amongst the most beautiful specimens of medieval art. In England, wooden

Porch of Aldham, Essex (1350).
(From Parker's Glossary of Architecture.)

porches, of picturesque structure, are very common in the parish churches of the middle ages.

PORCUPINE (*Hystrix*), a genus of mammalia, of the order *Rodentia*, and family *Hystriidae*. This family is remarkably characterised by an armature of spines, which, like those of the hedgehogs, are, as to their structure, merely thick and strong hairs. The *Hystriidae* are plantigrade; the fore-feet have four toes and a rudimentary thumb, the hind-feet have five toes. Their general aspect is heavy and pig-like, and they have a grunting voice. The muzzle is broad and blunt; the ears short and rounded; the incisors smooth and large, two above, and two below; the molars eight above, and eight below. The name porcupine is derived from the French words *porc*, a hog, and *epin*, a spine.—The **COMMON P.** (*H. cristata*) is a native of the south of Europe, of many parts of Asia, and of most parts of Africa. It is one of the largest of rodents, being from two to three feet in length, besides the tail, which is about six inches long. The hinder part of the head and the neck are furnished with a crest of long bristles, capable of being elevated or depressed at pleasure. The muzzle and limbs are covered with very short hair; the back and sides with

spines, which are longest on the middle of the back,

Porcupine (*Hystrix cristata*).

where they are almost of the thickness of a goose-quill, and more than a foot long. The spines are supported by a slender pedicle, and they terminate in a sharp point; they are longitudinally striated, and are ringed with black and white, which gives a general gray colour to the animal. Their ordinary position is flat, with the points directed backwards; but when the animal is excited, they are erected, and it rolls itself up like the hedgehog, with spines pointing in every direction. The tail spines or quills are of very singular structure, being open thin-sided tubes, about two inches long, supported upon slender flexible pedicles; and they make a sound by rattling together when the tail is shaken. The P. is said to rattle also the spines of its body when irritated, but this is doubtful. The statement has been often made, that it throws off its spines or quills by a voluntary act, launching them at its adversaries; but it has no such power, although it is possible that quills ready to come off may be detached in moments of excitement, and fly to a small distance with sufficient force to be annoying to a pursuer. The P.'s armour, however, is strictly defensive, and it seeks to turn its back, and thus the points of its spines to an enemy. It is a solitary and nocturnal animal. It burrows in the ground, and in winter it becomes torpid. It feeds on roots, bark, fruits, and other vegetable substances, sometimes committing great depredations in gardens. The spines or quills of the P. are used for various purposes, and have a certain commercial value. It is chiefly sought on account of them; although its flesh is eaten, and was brought to the market of ancient Rome.—A larger species of P. (*H. leucurus*), with the quills of the tail quite white, is found in India, and other species inhabit different parts of the East. The **ATHERURE**, or **TUFFED-TAILED P.** (*Atherura fasciculata*), a native of India and Malacca, differs from the true porcupines in the head and muzzle not being convex, in having the quills flattened like blades of grass, and those of the tail gathered into a tuft at the end of it. The Canada P., or Urson (q. v.), is still more different from the true porcupines; and the **Coendus** (*Syntheres*) of the warm parts of America—which are covered with short quills, and, like the urson, live among the branches of trees—are remarkably distinguished by their long prehensile tail.

PORIFERA (Lat. *pore-bearing*) is the term employed by Dr Grant to designate the class *Spongiae*, or *Sponges*, in consequence of the appearance which the members of this class present when a section is made through their tissue. The term *Spongia* is used in preference by many naturalists.

PORISM, a kind of geometrio proposition in high favour among ancient Greek mathematicians, but of which the notices that have come down to us are so few and meagre, that, till lately, mathematicians were not agreed about what a porism really was. The ancient works in which porisms are mentioned are the *Collectiones Mathematicæ* of Pappus, and the *Commentarii* of Proclus. Dr Robert Simson (q. v.) was the first to restore the probably original form of porisms. As defined by Playfair, 'a porism is a proposition affirming the possibility of finding such conditions as will render a certain problem indeterminate, or capable of innumerable solutions.' Good examples of porisms are given in Simson's *Opera Reliqua*; Playfair's 'Origin and Investigation of Porisms' (*Trans. of Roy. Soc. of Edin.*, vol. iii.); Wallace's paper, 'Some Geometrical Porisms, &c.' (*Edin. Trans.*, vol. iii. &c.)

PORK (Fr. *porc*, a hog, from Lat. *porcus*). The flesh of swine forms a very large portion of the animal food of most nations, although it is not the most nutritive, as will be seen by the following comparison of the four principal kinds of flesh-food:

	Mineral Matter.	Gelatin.	Fibrine and Albumen.	Fat.	Water.
Veal,	4.5	7.5	9.0	16.5	62.5
Beef,	5.0	7.0	8.0	30.0	50.0
Mutton,	3.5	7.0	5.5	40.0	44.0
Pork,	1.5	5.5	4.5	50.0	38.0

It has qualities, however, which especially fit it for man's use; its fatness makes it a very heat-giving food for cold and temperate climates; whilst it surpasses all other kinds of animal food in the ease with which it may be preserved by salting and drying. Hence the trade in pork is considerable in all countries where it is used, but especially so in Great Britain and America, where vast quantities are cured for the supply of ships and the army, and for home use. The quantity of pork imported into Britain from the United States is prodigious; in 1871, the value of the bacon and hams imported amounted to £4,188,981, besides pork to the value of £447,377. Millions of hogs are raised in the state of Ohio, and the curing of swine's flesh is the staple business of Cincinnati and other towns. A more vivid idea of the extent of this vast trade cannot be given than a recent statement of the *Louisville Gazette*, that 'there were between five and six acres of barrelled pork piled up three tiers high, in open lots, and not less than six acres unpiled, which would cover eighteen acres if closely laid in a single tier on the ground; besides all which, six acres of pens were filled with hogs waiting to be killed.' America has long furnished the chief supply of mess and common pork not only for the British army, navy, and mercantile marine, but also for those of most European nations. Next to America, Ireland, and especially the neighbourhood of Cork, furnishes the largest supply of cured pork; and London and Wiltshire, and other parts of England, also furnish vast quantities of bacon and hams for general consumption.

POROSITY. By this term we express the experimental fact, that no kind of matter completely fills the space it occupies; in other words, that all bodies are full of minute cavities or interstices, such as are illustrated on a large scale by a sponge. On the atomic theory, it is obvious that this must be the case if the atoms of matter are spherical, or, indeed, if they have any form save one or two special ones, such as cubes or rhombic dodecahedrons. It is commonly asserted that all bodies must be porous, because they are compressible; but this is a great

mistake, since we have no reason to believe that matter is not *per se* compressible, independently of the existence of interstices. The Florentine Academicians, in their attempts to compress water, proved the porosity of silver, by flattening a sphere of that metal, filled with water, and soldered. The water escaped through the pores of the silver, and stood in fine drops on its surface. The porosity of liquids is easily shewn by mixing alcohol and water. The bulk of the mixture is considerably less than the sum of the bulks of the components, shewing that these must in part have entered each other's pores. This property of matter is of great importance in natural phenomena, as it brings the molecular force of capillarity into play: raising the sap in vegetables, allowing rain to sink into the ground, &c.

PORPHYRIUS, one of that series of ancient philosophers to whom is due the reformation of the Greek philosophy known as Neo-Platonism, was probably born at Batanea in Syria (the Bashan of Scripture) in the year 233 A.D. His original name was Malchus, the Greek form of the Syro-Phœnician *Melech*, or king. The name by which he is known in history, *Porphyrius*, 'one clad in purple,' is but a Greek epithet intended as a sort of paraphrase of his name. He is said by Socrates the historian, and by St Augustine, to have been originally a Christian; but this seems improbable, although it is certain that in his youth he was a hearer of Origen, or at least held some intercourse with him at Cæsarea in Palestine. What is more certain is, that he passed at a later time to Athens, where he studied rhetoric under Longinus, the well-known author of the treatise *On the Sublime*. It was at Rome, however, whither he repaired soon after 260, that he entered upon what must be regarded as, historically considered, the career of his life. Here he became a scholar of the Neo-Platonist Plotinus, with whom, as well as with another member of the same school, named Amelius, P. entered into an animated controversy, but eventually adopted so fully the opinions of Plotinus, that he became himself, if not the leader of the school, at least the most trusted of the disciples of its master. After six years' residence in Rome, he went to Sicily, where, if St Jerome's account is to be relied on, he wrote his once celebrated treatise in 15 books against the Christians, now known only from the replies which it elicited, having been burned by order of the Emperor Theodosius. From Sicily, he went to Carthage, and afterwards to Athens; but eventually, Plotinus having died soon after P. left Rome, he returned to that city, where he continued to teach, as it would seem, until his death, which was probably about 305 or 306. For a view of P.'s position in the history of the Neo-Platonic school, see NEO-PLATONISTS. P. was a very voluminous writer. Of his works, the titles of more than 60 are still preserved, 43 of which are entirely lost. His *Life of Pythagoras*; his work *On Abstinence from Animal Food*; his *Commentary on Aristotle's Categories*, with the *Introduction*; and *On the Harmonies of Ptolemy*; and the book *Ad Marcellam*, addressed to his wife, are preserved entire. The rest are known chiefly by fragments, nor has any complete edition of his works been published.

PORPHYRY (Gr. purple), a term originally confined to an Egyptian rock used in sculpture, and known now as Rosso antico. It is composed, according to Delesse, of a red felspathic base, in which are disseminated rose-coloured crystals of the felspar called oligoclase, with some plates of blackish hornblende, and grains of oxidised iron ore. The term is not now, however, used to denote any particular

rock, but is applied to any rock which, like the Rosso antico, has a homogeneous earthy or compact base, through which are scattered distinct crystals of one or more minerals of contemporary origin with the base. Thus, gray volcanic trachyte often abounds in crystals of glassy felspar, forming a trachytic porphyry; or crystals of felspar, quartz, or calcareous spar, disseminated through a base of greenstone, form a greenstone porphyry. In the same way, there are pitchstone porphyry, basaltic porphyry, claystone porphyry, &c.

PO'RPOISE, or **PORPESSE** (*Phocæna*), a genus of Cetacea, of the family *Delphinidæ*, having a form similar to the dolphins, but the muzzle short, uniformly convex, and without a beak; a dorsal fin; the teeth very numerous, simple, and equal. The Common P. (*P. communis*) is the most plentiful of the Cetacea on the British coasts, abounding particularly on the western coasts of Ireland and of Scotland. It is found also on all the coasts of Europe from the Mediterranean northwards, on the

Porpoise (*Phocæna communis*).

coasts of North America, and in the arctic regions. It is one of the smallest of the Cetacea, its length sometimes not exceeding four feet, although individuals occur of six or even eight feet in length. The body is spindle-shaped; its greatest diameter is near the dorsal fin. The skin is perfectly smooth, and destitute of hair. There are from 40 to 50 teeth in each jaw, not conical, as in most of the Cetacea, but compressed. The eye is rather small, and the pupil in the form of a V. The opening of the ear is very minute, like a hole made with a pin. The blow-hole is crescent-shaped, with the horns of the crescent directed forwards, and is situated exactly over the eyes.

The P. is gregarious, and large numbers are often seen together, sometimes swimming in file, when their backs, appearing above the surface of the water, are apt to suggest the idea of a great serpent; sometimes gambolling, either in fine weather, or when a storm is approaching, or even in the midst of a storm. The P. feeds on fish, which its teeth are admirably adapted to catch, and herds of porpoises pursue the vast shoals of herring, mackerel, &c., into bays and estuaries. The P. sometimes ascends rivers, apparently in pursuit of salmon, as far as the water is brackish, and is not unfrequently itself caught on such occasions. It is an object of pursuit on account of its skin, its oil, and its flesh. The skin is nearly an inch thick, but is planed down until it becomes translucent, and is made into excellent leather, which is used for covering carriages and for other purposes. Little use is made of it in Britain, but it is used in America. Under the skin is a layer of fat, about an inch in depth, which yields oil of the finest quality. The flesh is dark-coloured and bloody, but was in former times highly esteemed, and

reckoned fit for the table of royalty, perhaps partly because among Roman Catholics it was accounted fish. In the time of Queen Elizabeth, it was still used by the nobles of England, and was served up with bread-crumbs and vinegar. It is now used only in very northern regions. It is a chief dainty of the Greenlanders.—The Grampus (q. v.) is commonly referred to this genus.—Another species of P. (*P. Capensis*) is found near the Cape of Good Hope.—The name P. is from the French *porc-poisson*, or the Italian *porco-pesce* (Hog-fish), corresponding to the French *marouin* (Sea-hog) and the German *meerschwein*.

PORR'IGO. See **FAVUS** and **RINGWORM**.

PORSE'NNA, also **PO'RSENA**, **LARS** or **LARTH** (*Lar*, in Etruscan means 'lord' or 'prince'), in the early and uncertain history of Rome, appears as a powerful king of Clusium in Etruria. According to the legend told by Livy for history, when Tarquin the Proud was expelled from Rome, he sought the help, first of the Veii and the Tarquinii (his Etruscan kinsmen), against his revolted subjects; but their efforts not proving successful, he turned to P., who willingly espoused his cause, and marched a great army against Rome. The Etruscan king seized the Janiculum, a fortified hill on the west side of the Tiber; and would have forced his way into the city across the 'Bridge of Wooden Piles' (*Pons Sublucius*), had not a brave Roman, Horatius Coclès, kept the whole of P.'s army at bay, while his comrades behind him hewed down the bridge; after which he plunged into the Tiber, and safely swam across its waves. P., now informed, now laid siege to Rome; and after a while, the inhabitants began to suffer so severely from famine, that a desperate expedient was had recourse to. Three hundred of the noblest Roman youths swore to peril their lives in cutting off the Etruscan king. The first on whom the lot fell was C. Mucius, who stole into the camp of P., but not knowing the person of the king, killed his secretary instead. He was instantly seized, and put to the torture; but the unshrinking audacity with which he thrust his right hand into the fire and let it burn, moved the king so much, that he pardoned him; whereupon Mucius (ever afterwards called *Scævola*, 'the Left-handed') told him of the jeopardy in which he was placed. P. resolved to make peace with Rome at once, and his conditions, which were pretty favourable, being accepted by the sorely-pressed citizens, he withdrew his forces. This version of the story is wholly discredited by modern criticism, and is believed to have been invented by the patriotic annalists of ancient Rome to conceal the fact of a temporary Etruscan conquest, and the evidence in favour of this view is overwhelming. Tacitus even expressly affirms that P. conquered the city; Dionysius informs us that the senate sent him an ivory sceptre, a golden crown, and a triumphal robe, which was the form that had been adopted by the Etruscan cities themselves of acknowledging the supremacy of the Roman king, Tarquinius Priscus; and Pliny mentions a circumstance which is quite conclusive as a proof of the subjugation of Rome—viz., that P. forbade the citizens to use iron, except for agricultural purposes. Niebuhr, who has placed this view beyond all doubt, notices various minor incidents which are perfectly unintelligible, except on the hypothesis of an Etruscan conquest. The whole details of the ancient legend, therefore, may be regarded as fabulous—the product of patriotic unveracity—and what seems most reasonable to believe, is, that a great rising of the Etruscan against the Latin races took place, and that Rome, forming the Latin frontier towards

Etruria, was exposed to the first brunt of the war, and suffered a disastrous defeat; but that shortly after, the Etruscans themselves were decisively beaten, and forced back into their own territories; for after the conquest of Rome, Aruns, a son of P., proceeded against Aricia, where (according to Livy) his army was routed under the walls of that city by the combined forces of the Latin cities, with the help of Greek auxiliaries from Cuma. It is worth while quoting, as a proof of Niebuhr's wonderful talent for felicitous conjecture, that he explains the long-surviving Roman custom of beginning an auction by offering for sale the goods of King P., by the supposition, that in the recovery of their independence, the Romans probably captured property belonging to their late master, which they may have publicly sold. The sepulchre of P. at Clusium is described by Varro, but his description is not credible. The ancient legend has been magnificently rendered in modern verse by Macaulay. See the *Lays of Ancient Rome*.

PORSON, RICHARD, the greatest Greek scholar England has ever produced, was born on Christmas 1759, at East Ruston, Norfolk, where his father was parish clerk. The curate of the parish conceiving a liking for the boy, on account of his omnivorous appetite for books and his marvellous memory, took charge of him, and had him educated along with his own sons. P. afterwards found a patron in Mr Norris (the founder of the Norrisian professorship at Cambridge), who sent him to Eton in 1774, where he remained four years, but did not acquire any of the ordinary distinctions, although it is evident that it was there his mind acquired a fixed bias towards classical studies. Another patron, Sir George Baker, sent him, in 1778, to Trinity College, Cambridge, of which he was elected a scholar in 1780. Next year, he won the Craven Scholarship, and subsequently, the first Chancellor's medal. In 1782, he was chosen a Fellow of Trinity. It was about this time that he began to give indications of his subtle sagacity and taste in the difficult verbal criticism of the Greek dramatists. For four years, he contributed to Maty's *Review*—his first critique being on Schulz's *Æschylus*, and his finest on Brunn's *Æristophanes*. He also opened a correspondence with Professor Ruhnken. If, however, we are to judge from a quatrain written at a later period of his life, he did more than correspond:

I went to Strasburg, where I got drunk
With that most learned Professor Brunn;
I went to Wurtz, and got more drunken
With that more learned Professor Ruhnken.

In 1787 appeared, in the *Gentleman's Magazine*, his sarcastic letters on Hawkins's *Life of Johnson*. For the same periodical, he also wrote his far more famous and trenchant *Letters to Travis on the Three Witnesses*. The dispute concerned the genuineness of John i. 7, 8, and was occasioned by a blundering and pretentious defence of the passage by Archdeacon Travis, against the scornful attack of Gibbon. P. naturally incurred great odium on account of the side which he took in this controversy. One old lady who had him in her will for a legacy of £300, cut it down to £30, when she heard that he had written a book against Christianity. In 1792, he resigned his fellowship, as he found that he could not conscientiously take orders in the church. Some of his friends now raised a fund to preserve him from want, and about £100 a year was secured. He was also appointed to the Regius professorship of Greek in the university of Cambridge—an office, indeed, only worth £40 a year; yet so splendid was his learning, so admirable his taste, so vigorous and

epigrammatic his style of criticism, that he might easily have—by the exercise of a moderate degree of continuous literary labour—succeeded in gaining a handsome income. But already 'two devils had him in their gripe'—procrastination and a raging thirst for drink—and they held him firm to the end of his melancholy career. The only thing he ever did in connection with his Greek professorship was to deliver a *prolectio* so excellent, that, it has been said, if he had passed from verbal to æsthetic criticism, he would have surpassed all his countrymen in that too. In 1794, he edited the plays of *Æschylus* for the Foulis press, Glasgow; and between 1797 and 1801, four of Euripides, the *Hecuba*, the *Orestes*, the *Phænissæ* and the *Medea*. He also collated the Harleian MS. of the *Odyssey* for the *Grenville Homer*. In 1806 he was appointed librarian of the 'London Institution' with a salary of £200; but was so grossly negligent of his duties, that the directors officially notified their dissatisfaction in these emphatic words: 'We only know that you are our librarian by seeing your name attached to the receipts for your salary.' He died of apoplexy, 25th September 1808, in the 49th year of his age, and was buried with great pomp in the chapel of Trinity College, Cambridge. P.'s rage for drink was fearful. He would pour anything down his throat rather than endure the 'terrible torture of thirst.' Ink, spirits of wine for the lamp, an embrocation, are among the horrible things he is reported to have swallowed in his extremity. 'He used to return to the dining-room after the company had left it; pour into a tumbler the drops remaining in the wine-glasses, and drink off the collectanea.' In fact, his thirst was so outrageous, that P. cannot be considered a mere wilful drunkard; one must believe that he was driven into his excesses by some unknown disease of his constitution. See POLYDIPSIA. P.'s memory was as amazing as his thirst. The anecdotes told by his biographers almost surpass belief, yet are thoroughly authenticated. His critical acumen has never been matched in England. His tracts, reviews, letters, &c., were collected and edited, with a biographical notice, by Kidd, in six volumes. See 'Porsonian' in Rogers' *Table-Talk*, and the Rev. J. Selby Watson's *Life of Richard Porson, M.A.* (1861).

PORT, in Naval Language, has at least three significations; first, a port is a harbour where ships are admitted to embark or discharge cargoes, or for other purposes—a free port being one in which the embarkation and discharge can be conducted without the payment of customs or port dues.—A port in a ship's side is the aperture for admitting light and air, or for pointing a gun through. See PORT-HOLE.—Port is also the official name for the left-hand side, when looking towards the bow of a ship—i. e., looking forwards. The term was, a few years ago, arbitrarily substituted for Larboard (q. v.).

PORT ARMS, in Musketry Drill, is derived from *portare*, to carry, and applies to a motion in which the fire-arm is supported or carried by the left arm under the guard of the piece, the arm being laid horizontally across the chest.

PORT-AU-PRINCE, or PORT-REPUBLICAN, the capital of Hayti (q. v.), is situated on the west coast, at the head of a bay of the same name, and has a fine appearance from the sea, but the interior is filthy in the extreme. The houses are chiefly of wood, and dungsteads obtrude everywhere, even in the thoroughfares. The most notable buildings are the palace and the senate-house; other public edifices are the churches, a lyceum, college, custom house, mint, and hospital. P. carries on a trade in

mahogany, logwood, honey, coffee, cocoa, and rags. Pop. about 21,000. The town has suffered frequently from earthquakes.

PORT D'URBAN, or **PORT NATAL**, the only seaport of the colony of **NATAL** (q. v.).

PORT ELIZABETH, an important seaport of South Africa, commercial capital of the Eastern Province of the British colony of the Cape of Good Hope, stands on the western shore of Algoa Bay (q. v.), in lat. about 34° S., long. 25° 35' E. Many of the streets are elegant. One range of houses, consisting of four streets, which will bear comparison with the best streets in England, forms a continuous line two miles in length. In the style of its buildings, this town is superior to any other in South Africa. Its magnificent warehouses are constructed on a palatial scale, and resemble the finest in London, and its public buildings are all solid and substantial edifices. The principal are the town-house, 90 feet square and three stories high, containing the public library, the *athenæum*, and the municipal chambers; the public hospital, furnished with 100 beds; the Presbyterian and other churches, and the Roman Catholic cathedral. Its educational institutions are of a superior description. In 1854, under the auspices of Governor Sir George Grey, a system of schools was introduced known as the Grey Institute Schools, founded on a magnificent grant of town-lands, yielding a revenue of over £1000 per annum, and affording a very excellent education at a very moderate charge. The chief of these are a high-school or college, and three elementary or district training-schools.

The town was founded in 1820, and it has a population of about 15,000. Its progress has been, and continues to be very rapid, and it is said to double itself in population, wealth, and extent every ten years. Its fixed or real property, as assessed in 1863 for municipal purposes, amounts in value to £1,268,765. It owes its commercial importance in great part to the circumstance of its being the emporium of the great wool trade of the colony; and besides this it carries on a rapidly-increasing home and foreign trade. The value of its home business may be estimated from the extensive transactions of its banks, which are three in number, and whose half-yearly statements for June 1864 shewed assets to the extent of over £1,500,000. Its foreign trade is with Europe, America, Brazil, Australia, Mauritius, China, and India, and the value of its exports and imports amounts to nearly £4,000,000.

The shore is open to the swell of the Indian Ocean, which often rolls in upon the beach with such violence that, until recently, cargoes could only be got to land by the use of surf-boats. Kaffirs, tempted by the high pay offered, used to come from a great distance to do the difficult and dangerous work of unloading the boats (which they did standing breast-high in the water), and carrying the bales to the shore. But this system of landing is now in great measure done away with, and ships now unload at jetties, several of which run out into the bay.

PORT-GLASGOW, a parliamentary burgh and seaport of the county of Renfrew, Scotland, is situated on the Clyde, about 2 miles east of Greenock and 20 miles north-west of Glasgow. It was founded in 1663 by the magistrates of Glasgow as a harbour for the ships that belonged to or traded with their city—the Clyde at Glasgow being then inconveniently shallow, and the idea of deepening the river not having yet occurred. In 1695, the town and a small adjacent district were made into an independent parish; in 1710, it was

constituted the principal custom-house on the Clyde, and for a while took the lead of Greenock; in 1775, it was incorporated as a municipality, and by the Reform Bill of 1832, it was raised to the rank of a parliamentary burgh, uniting with Kilmarnock, Rutherglen, Dumbarton, and Renfrew in electing a member of the legislature. P.-G. is rather a well-built town; the streets are in general regularly laid out, crossing each other at right angles, and the houses are of a substantial order. The principal buildings are the town-house, custom-house, and churches of the different denominations. P.-G. has extensive manufactures of sail-ropes, chain-cables, several sugar-refineries, foundries, building-yards, commodious quays and wet-docks. The deepening of the Clyde, by means of which large vessels can now ascend to Glasgow, seriously injured its commercial prosperity, but it is still the principal port on the Clyde for the importation of North American timber. Pop. about 12,000.

PORT LOUIS, the capital and principal port of the British colony of Mauritius, is situated on an inlet on the north-west coast. Its streets, though narrow, are straight, and are furnished with foot-paths, and macadamised. It contains a number of public buildings, among which are a theatre, library, hospital, and botanic garden. Its harbour is capacious, but is quite safe only during the fine season. The imports and exports of the colony are mainly transacted at P. L.; and their quantity, value, and character are mentioned under the article Mauritius (q. v.). Pop. of the port variously given at 26,000 and 35,000.

PORT MAHO'N (anc. *Portus Magonis*), the capital of the island of Minorca (q. v.), is beautifully situated on a deep and narrow inlet in the south-east of the island. Its harbour, sufficiently spacious to accommodate a large fleet of men-of-war, is one of the finest in the Mediterranean, and is protected by three forts. It has no architectural features worthy of special notice, but is on the whole well built. The military governor and the bishop of the island reside here. The government buildings were mostly constructed by the English. Pop. 13,300.

PORT PATRICK, a burgh of barony and fishing village of Scotland, in the county of Wigtown, and 6½ miles south-west of Stranraer. It is surrounded by hills on the land side, and its harbour is protected by two piers, but remains incomplete. It is the nearest point of Scotland to the Irish coast, being only 21½ miles north-east of Donaghadee. Pop. about 1000.

PORT PHILLIP. See **MELBOURNE**.

PORT ROYAL-DES-CHAMPS, a convent of Cistercian nuns, near Versailles, which obtained much celebrity during the 17th century. It was founded for nuns by a member of the family of Montmorenci, in the early part of the 13th c.; and soon after its establishment, obtained from the pope the privilege of receiving lay persons, who, without taking monastic vows, desired to live in religious retirement. This portion of the P. R. institute in later times became of great importance. The discipline of the convent having been much relaxed in the 15th and 16th centuries, one of its worst abuses—that of appointing the superior, not on account of fitness, but from considerations of family or other worldly or political motives—became in the end the occasion of its complete reformation. Angelique Arnauld, sister of the celebrated brothers Arnauld, was appointed, when a mere child, coadjutrix of the abbess, and on the death of this lady, although she was then only in her eleventh year, herself succeeded to the office. As Mère Angelique advanced in years, she felt moved, although still

very young, by a profound sense of her responsibilities, and undertook a complete and rigid reformation of the community, which she carried out in all its details—as the strict observance of religious poverty, abstinence from meat, complete seclusion, and the most severe ascetic exercises. The community was removed to Paris in 1626, and in 1633 to a new convent, which was thenceforward called Port Royal-de-Paris; and from this time the old establishment of P. R.-des-Champs was exclusively devoted to the use of a lay community, in accordance with the original papal privilege. This community quickly became very celebrated, and soon numbered among its inmates some of the most distinguished scholars of that age, Antony Arnauld, Le Maistre, Antony and Louis Isaac le Maître de Sacy, Nicole, Lancelot, Sericourt, and several others. Their rule of life was most austere, rising at 3 A.M., devoting many hours to prayer and spiritual reading and instruction, and a portion of the day to manual labour. One of their most important public services was the establishment of a school, for which they prepared the well-known educational books known under the name of Port Royal, the Greek and Latin Grammars, General Grammar, Geometry, Art of Thinking, &c. This school was for a time transferred to Paris, a portion of the nuns being sent back to P. R.-des-Champs; but eventually it was established at an out-farm of the latter place, called Les Granges.

P. R., however, is even more known in history through its relations with the Jansenist controversy. The nature and origin of these relations have been explained in the article JANSEN (q. v.). It only remains to relate the later fortunes of P. R. and its members, in so far as they were affected by the proceedings taken in consequence by the authorities, whether civil or ecclesiastical. The nuns of P. R. having refused to subscribe the formula condemning the Five Propositions, a royal order was issued in 1660 for the suppression of the school, and the removal of the boarders of P. R.-des-Champs; and at length the abbess, and several other nuns, were arrested, and confined as prisoners in other monasteries. After the 'Peace of Clement IX.,' they were permitted to return; but the two communities, P. R.-des-Champs and P. R.-de-Paris, were placed under separate government. This led to many disputes, and to a perpetuation in P. R.-des-Champs of the Jansenist spirit and the Jansenist opinions; and when the final steps for the repression of that party were taken about 1707, a formal bull was issued by Pope Clement XI. for the suppression of that convent, and the transfer of its property to P. R.-de-Paris. The nuns, accordingly, were finally dispersed and distributed over convents of different orders throughout France. The property of the convent and church were transferred to the Paris house, and all the buildings of P. R.-des-Champs were levelled to the ground, by order of the king. Most of the eminent names connected with P. R. will be found treated under separate heads.

PORT WINE (i. e., *Porto* or *Oporto Wine*), a species of red wine, hot and heady, which is produced chiefly in a mountainous district of Portugal, called Cima de Douro, and exported from Oporto and Lisbon. The vine from which this wine is produced is generally planted on craggy slopes with a southern exposure. The grapes are gathered from the commencement of September to the middle of October. The cultivation and gathering of the grapes for port wine employ annually 10,000 cultivators and 20,000 gatherers. The wine, when pure and unadulterated (which is very seldom the case), does not acquire its full

strength and flavour till it has stood for some years, but care must likewise be taken that it is not allowed to become too old. The colour of new port wine varies from pale rose to deep red, and changes with age, becoming a deep tawny brown, which is permanent. By far the greater portion of the wine made is mixed with spirit even during the time of fermentation, in order to give the new wine the ripeness and strength which exporters require, and which the wine does not naturally attain till it has stood for some time; the proper colour is also given by an ingredient known as *jeropiga*, which is a preparation of elder-berries, molasses, raisin-juice, and spirit. It is an excess of this *jeropiga* in the inferior sorts of port which communicates to them the medicated odour so frequently noticed. The extreme 'headiness' of port is chiefly due to the liberal admixture with spirit, and this is the case with all the sorts generally exported. From the time when port came into demand (about 1700, though it was known in England for a considerable time before this) down to 1826, its export was a monopoly in the hands of the English merchants, and the amount of wine produced increased, with tolerable steadiness, year after year till 1836, when it reached 38,459 pipes, valued at £1,122,500. The ultimate effect of this monopoly was to increase the price of port wine in England, and at the same time so to deteriorate its quality, that in course of time it became of less demand, and was gradually, to some extent, supplanted by Southern French and other wines. Since 1836 it has fluctuated, being sometimes more and sometimes less than this figure; in 1850 the exportation reached 37,487 pipes, of which 25,400 were sent to Great Britain, the rest chiefly to other parts of Europe, America, and Brazil. In 1867. Oporto shipped 34,679 pipes.

PORTADOWN (Ir. *Port-na-Doon*, Port of the Fort), a market and manufacturing town of the county of Armagh, Ulster, Ireland, on the Bann, 11 miles north-east of Armagh by railway. It was formerly the seat of the Mc'Canns, a clan tributary to the O'Neil, and formed part of the territory 'settled' by James I., and afterwards by Charles I. It is a place of considerable trade in corn, flax, and other agricultural produce, and is the seat of an extensive manufacture of linen yarns and linen. Enjoying the advantage of communication by canal with the sea at Newry, and by railway with Belfast, it has also a considerable import trade. The population in 1871 was 6735, of whom 3147 were of the Established Church, 1930 Roman Catholics, 357 Presbyterians, 715 Methodists, and the rest Protestants of other denominations. P. is also connected by the Ulster Railway with Armagh, Dungannon, and the north-west counties. Pop. in 1881, 7850.

PORTAL, the recess of a large doorway, such as the entrance to a church. See PORCH.

PORTAMENTO (Ital. *portare*, to carry), a musical term used for the sustaining of the voice, and passing from one note to another.

PORTARLINGTON, a market town and parliamentary borough, partly in the King's County, partly in the Queen's County, Leinster, Ireland, on the Barrow, 44 miles west-south-west from Dublin, with which it communicates by the Great Southern and Western Railway. Pop. in 1871, 2424, of whom 1688 were Roman Catholics, and 673 Protestants of the Established Church. P. was anciently called Cooltetooodra; but being granted by Charles II. to the Earl of Arlington, was called by his name. By him it was sold to Sir Patrick Traul; and on the attainder of Sir Patrick, was granted by William III. to General de Rouvigny, who planted in it a colony of French

and Flemish Protestants, many of whose descendants still remain. It is now the property of the family of Dawson, created Earls of Portarlington. It returns one member to the imperial parliament. The town is neat and well built, and is provided with several schools, two national, two endowed, and also private schools of considerable reputation, at one of which the late Duke of Wellington and his brother Lord Wellesley received part of their education. Pop. in 1881, 2426.

PORTCULLIS (Fr. *porte*, gate, and *coulisse*, from *couler*, to flow), a frame of wood strengthened

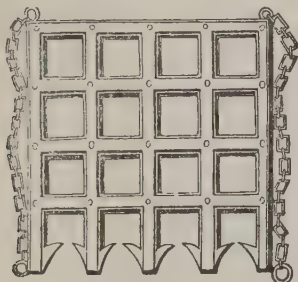

Fig. 1.

with iron in the form of a grating, and sliding in vertical grooves in the jambs of the entrance gate of a fortified place, in order to defend the gate in case of assault. The vertical bars were pointed with iron below, and struck on the ground when

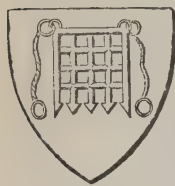

Fig. 2.

the grating was dropped, so as to injure whatever it fell upon. In Heraldry, the portcullis is represented with rings at its uppermost angles, from which chains depend on either side. It was a badge of the Beaufort family, and borne in virtue of their Beaufort descent by the Tudor sovereigns. Portcullis is the title of one of the pursuivants belonging to the

English College of Arms, whose office was instituted by Henry VII.

PORTE, Sublime Porte, or Ottoman Porte, the name given to the Turkish government. The origin of this name is to be referred to the ancient oriental custom of making the gates of cities and of king's palaces places of assembly in connection with the affairs of government and of the administration of justice. In the Byzantine empire this custom was adopted, and the term was transferred from the high gate of the imperial palace to the government whose authority was there exercised. The Turks found the term in common use among the Byzantines some time previous to their establishment at Constantinople, and adopted it on the organisation of their empire. The use, among European nations, of the French term *Sublime Porte* ('Lofty Gate') is accounted for by the fact that French is the language of European diplomacy.

PORTER, a kind of malt liquor which came into use in London in 1722. According to Leigh, 'the malt liquors previously in use were ale, beer, and twopenny, and it was customary to call for a pint or tankard of half-and-half—i.e., half of ale and half of beer, half of ale and half of twopenny, or half of beer and half of twopenny. In the course of time it also became the practice to ask for a pint or tankard of three-thirds [or, as it became corrupted, *three threads*], meaning a third each of ale,

beer, and twopenny; and thus the publican was obliged to go to three casks for a single pint of liquor. To avoid this trouble and waste, a brewer of the name of Harwood conceived the idea of making a liquor which should partake of the united flavours of ale, beer, and twopenny. He did so, and succeeded, calling it entire, or entire butt beer, meaning that it was drawn entirely from one cask or butt; and being a hearty nourishing liquor, it was very suitable for porters and other working people. Hence it obtained the name of Porter, and was first retailed at the Blue Last, Curtain Road, Shoreditch.' The chief characteristics of porter are its dark-brown colour, peculiar bitter flavour, and agreeable freshness in drinking. Until within the last ten years it was generally brewed with malt roasted until slightly brown; now, however, under the improved system of brewing, pale malt, with the addition of some highly roasted, for the sake of colour only, is used. Enormous quantities are brewed by the London brewers. A kind much stronger than ordinary porter is also extensively brewed under the name of *stout*.

PORTER, DAVID D. See SUPPLEMENT in Vol. X.

PORTFIRE is a sort of slow match for firing guns. It consists of a paper tube from 16 to 20 inches in length, filled with a composition thus proportioned—saltpetre 666 parts, sulphur 222 parts, mealed gunpowder 112 parts. The composition is rammed with force into the paper barrel, and then, when ignited, it burns for a considerable period. As a substitute, may be employed soft brown paper dipped in a solution of two ounces of nitre to a gallon of water, dried, and rolled up to the size of a common portfire. Another portfire consists of a rod cut square, of lime, birch, or poplar, boiled for six hours in a solution formed by dissolving one pound of nitrate of lead in one quart of water. The rod is subsequently boiled in spirits of turpentine. When thoroughly dried, one yard will burn three hours.

PORTHOLES are embrasures or openings in the side of a ship of war to enable the guns to be ranged in battery. The portholes are ordinarily square, of size sufficient to enable the guns to be pointed at a considerable angle. In stormy weather the ports are closed, the guns being run in. When the guns are run out, and no fighting is anticipated, half-ports are employed to keep the water out. There is a row of ports for each gun-deck, and by these rows the rating of the vessel is described as three-decker, two-decker, &c. Within the port, rings are fixed through which the ropes are passed for working the heavy guns.

PO'RTICI (formerly *Portico*), a town of Southern Italy, is situated on the slope of Vesuvius, near Herculaneum, 4 miles south-east from Naples, with 11,288 inhabitants. Its environs are delightful, and are dotted all over with country houses. There is a royal palace built by Charles III., but it is crossed by the high road, which divides it in two. Facing the palace is a fortress rising out of the sea, and there is a small harbour called the Granatello.

PO'RTICO, a covered space with a roof supported by columns. It is usually attached to an important building, but sometimes detached, as a shady walk. A portico is called tetrastyle, hexastyle, octostyle, and decastyle, according as it has four, six, eight, or ten columns in front.

PORTION, though not a legal term, is often used in the law of intestacy and legacies, and means a sum of money given to a child in discharge of the obligation incumbent on a parent; and from the circumstance of its being often given on marriage it is called a marriage-portion. By the law of England

and Ireland, therein differing from the law of Scotland, a parent is not bound at common law to give any portion to his children. But he often does so by will; and, in the event of his dying intestate, the law does so for him. When a testator by will leaves a legacy to a daughter, child, or person, towards whom he stands *in loco parentis*, and afterwards in his lifetime gives the child a like sum of money, or even a less sum as a portion on marriage, such portion is *prima facie* presumed to be in satisfaction, or an ademption of the legacy, unless there is something in the will or settlement to rebut that presumption. But in Scotland there is no such presumption, unless the father was liable by contract to give the portion. Paterson's *Comp. of E. and S. Law*, 711. See TOCHER.

PORTIONERS, in the Law of Scotland, mean two or more females who succeed jointly to heritable estate in default of heirs male, corresponding to Coparceners in England. See **HEIRS** **PORTIONERS**.

PORTLAND, a city and seaport of Maine, U. S., situated on an arm of the south-west side of Casco Bay, lat. 43° 40' N., long. 70° 13' W., 105 miles north-east of Boston. It is beautifully situated on a peninsula three miles long by three-fourths of a mile broad, with broad shaded streets, and handsome public and private edifices. Among the former is a fire-proof iron and granite building for the United States' Courts and Custom-house; a city hall, of olive-coloured freestone, 150 by 232 feet; public halls and libraries, Charitable Mechanics' Association, Athenæum, Society of Natural History's Hall and Cabinets, public schools, and 27 churches. There are 16 newspapers, 4 of which are daily. The harbour of P. is large, deep, well sheltered, and seldom frozen, and is the winter-station of the Canadian steamers. It is defended by Forts Preble and Scamell. There are 5 railways, including one to Quebec and Montreal, locomotive and marine engine manufacturing, sugar refineries, 7 banks, and a large coasting trade. P., first named Falmouth, was settled by an English colony in 1632, and was three times burned in the wars with the French and Indians. Pop. in 1860, 26,342; 1870, 31,413; 1880, 33,810.

PORTLAND BEDS, a division of the Upper Oolites (q. v.), occurring between the Purbeck Beds and the Kimmeridge Clay, and so named because the rocks of the group form the promontory of the Isle of Portland. They consist of beds of hard oolitic limestone and freestone, interstratified with clays, and resting on light-coloured sands, which contain marine fossils. The corals found in the sands are often converted into flints, the original structure being beautifully preserved in the hard silex. The beds may be traced from the Isle of Portland, capping the oolitic hills as far as Oxfordshire. The fossils are chiefly mollusca and fish, with a few reptiles.

PORTLAND CEMENT. See **CEMENT**.

PORTLAND ISLE, a rocky peninsula projecting into the English Channel from the shore of Dorsetshire, 17 miles west-south-west of St Alban's Head. Its appearance suggests the shape of a *beak*, and it is therefore called also the *Bill of Portland*. It is 9 miles in circumference, is composed of oolitic limestone, and slopes southward, with an even surface from the height of 490 feet to that of 30 feet above sea-level. Its sides are extremely rugged, and are worn into fantastic caverns by the furious action of the waves. The peninsula is supposed to have been once an island, but for ages it has been connected with the mainland by *Chesil Bank*, an extraordinary ridge of loose shingle, which, after running north-west in a straight line close to the shore for about 10 miles, joins the mainland at Abbotsbury. South-

west winds prevail on this part of the coast, and during their continuance the long ridge of Chesil Bank is lashed by a frightful sea, and is the scene of frequent shipwrecks. A long narrow inlet of the sea, called the *Fleet*, extends between Chesil Bank and the shore, and is the haunt of numerous wild-fowl. *Portland Castle*, in the north of the isle, is a ponderous building, erected by Henry VIII. as a protection for this part of the coast in 1520. The peninsula furnishes the famous Portland Stone (q. v.). Portland Breakwater, built of stones obtained on the island, is partly described under the article **BREAKWATER** (q. v.). This great national work has been but recently finished; in connection with it are also a naval station, harbour of refuge, and batteries. *Pennsylvania Castle*, in a most romantic district on the east coast, was built by John Penn, the grandson of the founder of Pennsylvania. *Rufus Castle*, or, as it is commonly called, *Bow and Arrow Castle*, also on the east coast, is now a ruin, and is generally said to have been built by William Rufus. On Portland Bill, the southern extremity of the island, are two light-houses, one 130, and the other 197 feet above sea-level. Between the southern point and the *Shambles*, three miles to the south-east, a dangerous surf, well known as the *Race of Portland*, is raised by the rushing of the impetuous tides. The convict prison, near the east coast, erected in 1848, consists of eight wings, besides the hospital, chapel, barracks, and cottages for the warders. It accommodates about 1500 convicts, besides the officers, and is maintained at an annual cost of upwards of £50,000, or at the rate of £33 per prisoner. The inhabitants of the island long remained a peculiar people, intermarrying, and preserving, generation after generation, the many curious customs of their ancestors. The island itself is chiefly remarkable for its abundant supply of excellent spring water, for its building-stone, and for its breed of sheep, the flesh of which, well known as Portland mutton, is celebrated for its flavour. The pop. of the parish of P. amounted in 1871 to 9907; in 1881, 10,046.

PORTLAND SAGO. See **ARUM**.

PORTLAND STONE. This celebrated building stone, of which many of the principal buildings of London, including St Paul's Cathedral, Somerset House, and many of the churches are constructed, is the oolitic limestone of Dorsetshire, constituting geologically the *Portland and Purbeck Beds*. The quarries are chiefly located in the islands of Portland and Purbeck, and in the Vale of Wardour. The quantity raised is very large. During the heavier works at the Portland Breakwater 730,000 tons per annum were required for that structure alone, and about 30,000 to 40,000 tons are sent annually to London and other places. There are three different qualities of the stone in the same quarry: the uppermost contains numerous fossils, and is of a coarse grain; it is therefore used chiefly for rough work, such as foundations. It is called *Roach* by the quarrymen. The middle bed is much broken, and is called the *rubble* or *rubbly bed*, and is of little value; and the lower one is fine, white, and compact, and is called the *whit*, or *best bed*. This last is that which is used for fine building purposes. An analysis of this stone by Professor Daniell shews the following composition:

Silica,	1.20
Carbonate of Lime,	85.16
Carbonate of Magnesia,	1.20
Iron and Alumina,	0.50
Water and loss,	1.94

Besides which ingredients, there is often a trace of bitumen present.

PORTLAND VASE. A beautiful cinerary urn, of transparent dark-blue glass, found about the middle of the 16th c. in a marble sarcophagus near Rome (see the article **GLASS**, where it is figured and described). It was at first deposited in the Barberini Palace at Rome (and hence often called the Barberini Vase); it then became (1770) the property, by purchase, of Sir William Hamilton (q. v.), from whose possession it passed into that of the Duchess of Portland. In 1810 the Duke of Portland, one of the trustees of the British Museum, allowed it to be placed in that institution, retaining his right over it as his own property. In 1845 a miscreant named William Lloyd, apparently from an insane love of mischief or a diseased ambition for notoriety, dashed this valuable relic to pieces with a stone. Owing to the defective state of the law, only a slight punishment could be inflicted; but an act was immediately passed, making such an offence punishable with imprisonment for two years, and one, two, or three public or private whippings. The pieces of the fractured vase were carefully gathered up, and afterwards united in a very complete manner; and thus repaired, it still exists in the Museum, but is not shewn to the public. A small number of copies of the Portland Vase were made many years ago by Mr Wedgwood, and were sold at 25 guineas each.

PORTLAW, a small manufacturing town of the county of Waterford, Munster, Ireland, about 10 miles west-north-west of Waterford. P. has risen within the last 30 years from a small village into a town of great activity and of extensive manufactures, through the enterprise of a single family named Malcomson, by whom the cotton manufacture has been introduced with great success. The population in 1871 was 3143, of whom 2980 were Catholics, 134 Protestants of the Established Church, 21 Presbyterians, and the remaining, Methodists. P. is admirably provided with schools and other institutions for the social and moral improvement of the population.

PORTO ALEGRE, a town of Brazil, capital of the province of São Pedro do Rio Grande, stands at the north-west extremity of the Lake of Patos, by means of which it communicates with the sea. It was founded in 1743, is well built, and contains 14,000 inhabitants. It is provided with wharfs; and its trade, though not altogether inconsiderable, has been much retarded by the frequently disturbed state of the country.

PORTOBELLO, a parliamentary borough and watering-place, occupies a plain on the south bank of the Firth of Forth, in the county of Edinburgh, and three miles east of the city of that name by the North British Railway. A commodious new town-hall was built here and opened in 1863. This town is a favourite resort for sea-bathing and summer quarters during the season. Besides the facilities for bathing offered by the fine sands of the shore, there is a commodious suite of baths of different kinds. A marine promenade, a mile in length, runs along the shore. P. is also a manufacturing town, and its manufacturing establishments comprise potteries, and earthenware, bottle, brick, and paper works, &c. Pop. (1871) 5373; and, in summer, between 7000 and 8000. The town derives its name from the first house built here about the time of the seizure of the town of Puerto Bello, in the Isthmus of Panama, and which was called Portobello. Pop. in 1881, 6793.

PORTO FERRAJO. See **ELBA**.

PORTO NOVO, a town in the Madras Presidency of India, situated on the Coromandal coast, in lat.

11° 31' N., and long. 79° 51' E. Both the Danes and the Dutch had formerly a factory here. The place is celebrated for the battle fought here on 1st July 1781, when Sir Eyre Coote defeated Hyder Ali. The British force consisted of only 7878 men, including artillery; Hyder's army numbered over 60,000. Coote was retiring before Hyder. After leaving P. N., he had only advanced a few miles along the seashore, when he found his path intercepted by the enemy's batteries, the sea confining him on the right, and a range of sand-hills on the left. The British army made two assaults; in one, they carried the batteries; in the other, they took advantage of an opening in the sand-hills, which Hyder had neglected to guard, and came suddenly upon the enemy's flank. A schooner of war meantime standing in close, poured her broadsides of small guns into the enemy. Their rout was complete. P. N. is celebrated for its iron foundry, which of late years has supplied much of the material for the Madras railways. The population of P. N. is about 7500.

PORTO RICO. See **PUERTO RICO**.

PORTREE. See **SKYE**.

PORTREEVE (from *port* and *reeve*, Saxon *gerefa*, a word of similar origin to the German *graf*, signifying a governor or chief magistrate), the principal magistrate in a maritime town. This was the early name of the officer afterwards called mayor in London and elsewhere.

PORTSEA ISLAND, a small island on the south coast of Hampshire, has on its west side Portsmouth Harbour, on its south-east side Langston Harbour, on its east side Chichester Harbour, and is separated from the mainland on the north by a narrow channel, crossed by several bridges. It is four miles long, by from two to three miles broad, and contains the important towns of Portsea and Portsmouth (q. v.).

PORTSMOUTH, the chief naval arsenal of Great Britain, and an important seaport, market-town, and municipal and parliamentary borough, in the south of Hampshire, stands on the south-west shore of Portsea Island (q. v.), at the entrance to Portsmouth Harbour, and opposite the town of Gosport, with which it communicates by means of a steam-bridge. It is 74 miles south-west of London by the London and South-western Railway. Besides the parish of P., the limits of the municipal and parliamentary borough, which are co-extensive, include also the parish and town of Portsea, and the outwards Landport and Southsea. The population of the borough, with its suburbs, was, in 1881, 127,953. P. is for the most part a mean-looking, dirty town, though, as a fortress, it is considered the most perfect in Britain. Formidable batteries defend the harbour; and bastioned ramparts, faced with masonry, planted with trees, and surrounded by trenches and outworks, enclose the town. Portsea, about a mile to the north, is similarly fortified, the line of its land-defences being distinct from that of Portsmouth. Southsea, which is situated outside the walls skirting Southsea Common, is rapidly increasing and is now a fashionable watering-place. In the town proper, there are few objects of note. Pleasing views may be had from the ramparts and batteries, as the harbour, the roadstead of Spithead, and the Isle of Wight, on the coast of which the white walls of the royal residence of Osborne House are seen gleaming among the trees. Among the few notable buildings may be mentioned the church of St Thomas, the chancel and transepts of which date from the 12th c., and which contains a ghastly cenotaph in memory of the murdered Duke of Buckingham (see *infra*). In front of the Garrison

Chapel is buried the brave Sir Charles James Napier (q. v.), who died in this neighbourhood in 1853. The dockyard of P., in the district of Portsea, is at present 116 acres in extent, the largest in the country. Works are, however, now in progress which will increase the area to a total of 293 acres. Of this immense naval establishment, the most noteworthy, if not the most recent, features are the mast and rope houses, hemp-stores, rigging-stores, sail-loft, and the dry docks, six in number, spacious enough to admit the largest vessel, and offering every facility for their speedy repair. The docks are generally 22 feet deep, lined with solid masonry, and roofed over and closed by lock-gates. Of the various building-slips, one of them, roofed and covered in, is so large that three or four vessels can be in process of construction under it at the same time. The Wood Mills contain a number of most ingenious block-making machines, the invention of Sir Isambard Brunel, in which rough timber, introduced at one end, is cut, squared, drilled, bored, and turned into the required shape. About 140,000 blocks are made here annually, and the machines require the attendance of no more than four men. In the smithy, anchors are forged by aid of a Nasmyth's hammer. The dockyard also contains the residences of the superintending officers, and a school of naval architecture.

Portsmouth Harbour, about 420 yards wide at its entrance, expands into a spacious basin, extending inland for about 4 miles, and having a breadth of 3 miles along its northern shore. Large war-vessels can enter and lie at anchor at all times of the tide. The outward entrance is defended by Monkton Fort and Southsea Castle. The position of this harbour is highly favourable. It is situated in the middle of the channel, close to the magnificent anchorage of Spithead, where 1000 ships of the line may ride without inconvenience, and is under shelter of the Isle of Wight, and opposite the French arsenal of Cherbourg.

The local trade of P. is supported by the dock-yard and the other public establishments of the town. Brewing is largely carried on in the town and vicinity. Coals, cattle, sheep, and provisions are imported from the English coasts, and timber and wine from abroad. In 1875, 1937 vessels (185,756 tons) entered, and 1080 (53,446 tons) cleared, the port.

The importance of this port dates only from the reign of Henry VIII. Its defences were strengthened by Elizabeth, and afterwards in a more thorough manner by William III. Here, in a house that still remains in the High Street, and which was then an inn called the 'Spotted Dog,' the Duke of Buckingham (the 'Steenie' of King James) was assassinated by John Felton. On the 29th of August, 1782, when its commander, Admiral Kempenfeldt, was writing in his cabin, the *Royal George* went down in the harbour, and nearly 1000 lives were lost.

PORTSMOUTH, a city and the only seaport of New Hampshire, U. S., is on the south bank of the Piscataqua River, three miles from the Atlantic, and 54 miles north-north-east of Boston; a well-built town, having 10 churches, Athenæum, state arsenal, academy and public schools, 2 market-houses, almshouse, 5 banks, manufactories of cotton and hosiery, foundries, and breweries. There are a safe and deep harbour, a United States' navy-yard, having a balance-dock, 350 feet long, and two forts, McCleary and Constitution. Settled in 1623. Pop. (1870) 9211; (1880) 9690.

PORTSMOUTH, a city and port of Virginia, U. S., on the west bank of Elizabeth River, opposite

Norfolk, and 8 miles from Hampton Roads. It has a court-house, scientific and military academy, 5 newspapers, 6 churches, tobacco-factories, &c., and connections with the southern railways. Its proximity to Fortress Monroe caused it to be held, during the War of Secession, by the Federal forces. Pop. in 1870, 10,590; in 1880, 11,390.

PORTSMOUTH, a village of Ohio, U. S., on the north bank of the Ohio River, at the mouth of the Scioto, the terminus of the Scioto and Hocking Valley Railway, and Ohio and Erie Canal, 115 miles east-by-south from Cincinnati, and 90 south of Columbus. It has 10 churches, 2 iron foundries, 3 machine-shops, 2 distilleries, 6 banks, and 3 newspapers. Pop. in 1870, 10,592; in 1880, 11,321.

PORTUGAL, the most westerly kingdom of Europe, a part of the great Spanish peninsula, lies in 36° 55'—42° 8' N. lat., and 6° 15'—9° 30' W. long. Its greatest length from north to south is 368 miles, and its average breadth from east to west about 100 miles. The kingdom of P. Proper is bounded by the Atlantic on the S. and W., and by Spain on the N. and E. Its distinctive subdivisions, with their several areas and populations, are given in the following table:

CONTINENTAL PORTUGAL.

Provinces.	Districts.	Area in Sq. Miles.	Pop. 1878.
MINHO,	Viana, Braga, Porto.	2807	982,735
TRAS OS MONTES,	Braganza, Villa-Real.	4288	393,279
BEIRA,	Aveiro, Coimbra, Viseu, Guarda, Castello-Branco.	9245	1,323,134
ESTREMADURA,	Leiria, Santarem, Lisbon.	6873	911,922
ALENTEJO,	Portalegre, Evora, Beja.	9416	350,103
ALGARVE,	Faro,	1873	199,142
Total,		34,502	4,160,315

The insular appendages of P. are: The Azores, 1996 square miles, pop. (1871) 258,933; Madeira, &c., 315 square miles, pop. (1871) 118,379. Total home territories, 36,813, and the population (1871), 4,367,882.

The colonial possessions of P. are, in Africa—Cape Verd Islands, 1630.02 square miles; pop. 67,347. Senegambia, 35,437.50 square miles; pop. 8500. Islands of San-Thome and Principe, off Guinea, 448.56 square miles; pop. (1868) 19,295. Angola, Benguela, 200,602.50 square miles; pop. 2,000,000. Mozambique and dependencies, 283,500 square miles; pop. 300,000. In Asia—Goa, Salcete, 1440.6 square miles; pop. 474,234. Damao, Din, 94.08 square miles; pop. 53,283. In the Indian Archipelago, 2877 square miles; pop. 850,300. In China, Macao, 11.76 square miles; pop. (1866) 100,000. Total of colonies, 526,041.48 square miles; pop. 3,872,959.

Physical Aspect, &c.—P. must be regarded as essentially a littoral country, forming the Atlantic or western part of the Spanish peninsula, from which it is separated by political rather than physical boundaries. Its mountains and rivers are, with few exceptions, mere western prolongations of those of Spain. The principal mountain ranges lie about half-way inland, leaving almost

the whole of its 500 miles of coastline a flat sandy tract, with few rocky headlands, and hence there are scarcely any harbours or places of safe anchorage, except at the embouchures of the larger rivers. The highest range is the Serra de Estrella, which, passing from north-north-east to south-south-west, through Beira and Estremadura, terminates in the steep acclivities of Cintra and Cap la Rocca, near Lisbon. The principal chain, which is also known as the Serra da Junto, merges in a series of ridges, which cover a tract thirty miles in length, between the Tagus and the sea. Another mountain range, named the Serra de Calderão and the Serra de Monchique, but constituting a mere continuation of the Spanish Sierra Morena, crosses the southern part of P. from east to west, and terminates in its most southern promontory of Cape St Vincent. These ranges, with the numerous mountain-spurs that intersect the northern districts in every direction, so thoroughly occupy the area of P., that there are only two or three plains of any extent in the whole country, and these are situated to the west of the Guadiana, in Alentejo, and in Beira and Estremadura, near the Tagus and Vouga. The valleys are very numerous, and by their great fruitfulness, present a striking contrast to the barren and rugged mountains by which they are enclosed. The principal rivers enter P. from Spain. Of these, the largest are the Guadiana, which, leaving Spain near Badajoz, forms in part the boundary between the southern provinces of the neighbouring kingdom; while the Minho and Douro, flowing west, form a part of the boundary in the north and north-east. The Tagus, or Tejo, intersects P. from its northern frontier to the southern termination of the Estrella Mountains, where it enters the sea a little below Lisbon. The Mondego, the largest river belonging entirely to P., after receiving numerous affluents in its course, falls into the sea about midway between the Douro and the Tagus. The larger rivers, although obstructed at their mouth with dangerous bars, afford admirable means of internal navigation, together with the numerous lesser streams, and might through canals be connected into one great system of water-routes; but hitherto nothing has been done to improve these great natural advantages. Except a few mountain tarns, P. has no lakes. It has salt-marshes on the coast, near Setúbal in Estremadura, and Aveiro in Beira, whence large quantities of salt are annually obtained by evaporation. Minerals springs are abundant in many parts of the country, but hitherto they have been almost wholly neglected.

The vicinity to the western ocean tempers the climate of P., and exempts it from the dry heat by which Spain is visited. The great inequalities of the surface produce, however, great diversities of climate; for while snow falls abundantly on the mountains in the northern provinces, it is never seen in the lowlands of the southern districts, where spring begins with the new year, and harvest is over by midsummer. Rain falls abundantly, especially on the coast, from October to March, and, as a general rule, the climate is healthy in the elevated districts even of the southern provinces; but malaria and fever prevail in low flat lands and near the salt marshes. The mean annual temperature at Lisbon is 61° Fahr.

The natural products correspond to the diversity of the physical and climatic conditions, for while barley, oats, and wheat, maize, flax, and hemp, are grown in the more elevated tracts, rice is cultivated in the lowlands, the oak thrives in the northern, the chestnut in the central, and the cork, date, and American aloe in the southern parts, while every species of European, and various kinds of

semi-tropical fruits and vegetables, are grown in different parts of the country. The soil is generally rich, but agriculture is everywhere neglected, and is scarcely made subservient to the wants of the population. The cultivation of the vine and that of the olive are almost the sole branches of industry; from the former is derived the rich red wine familiarly known to us as Port, from its being shipped at *O Porto*, 'the port.' The mineral products include gold, antimony, lead, copper, marble, slate, coal, iron, and salt, but of these the last is alone worked in sufficient quantity for exportation, and is in eager demand for the British market, on account of its superior hardness, which adapts it specially for the salting of meat for ships.

The finest cattle are reared in the north, the horses of Alentejo and the sheep of Beira are most valued. Mules and asses are the principal beasts of burden. Goats and pigs are numerous, and are raised at a very low cost, in all the mountain districts. The rearing of bees and silk-worms is being pursued with somewhat increased energy of late years. Fish is abundant in all the rivers and on the coast. The tunny and anchovy fisheries of Algarve are of considerable importance.

Commerce, &c.—The commercial industry of the country falls very far below its physical capabilities, and Oporto and Lisbon are the only centres of manufacture and trade, the former of which has important silk and glove manufactories, and produces an inconsiderable quantity of linen, cotton, and wool fabrics, metal and earthenware goods, tobacco, cigars, leather, &c. In 1869, 4525 large sea-going vessels entered, and 4428 cleared, the ports of P.; of Portuguese sea-going vessels, 856 entered and 718 cleared, and of coasters, 5051 entered and 5136 cleared. In 1864, the imports and exports were valued, respectively, at £3,085,190 and £923,757. In 1872, 300 miles of railway were open, principally in the environs of Lisbon, Oporto, Santarém, and Vigo; but the country is almost entirely without roads, the few which exist having been made only within the last twenty years, before which time the whole of the kingdom was in the same impassable condition in which the southern provinces still remain. The scarcity and inefficiency of bridges, and the total want of canals, render internal traffic almost impracticable, and, as a matter of course, put an impassable barrier in the way of the progress of civilisation, and the growth of material prosperity.

The commercial relations of P. are chiefly with Great Britain, and there is very little trade either by sea or land with other countries. Next to Great Britain stand Brazil and France, but far below in amount of commerce. In 1874 the exports from P. to Great Britain amounted to £4,329,806, and the imports of British produce into P. to £2,934,393. These figures are some what in excess of the average trade for 10 years past. The exports of wine average about £1,000,000 annually.

The budget for 1873–74 gives the total of the receipts, which are derived from direct and indirect taxation, and from the national domains, at 23,163,564 milreis, while the expenditure, including home and foreign debts, the charges of the state, public works, &c., is estimated at 23,907,006 milreis; leaving a deficit for the year of 743,442 milreis. The budget for the foreign possessions of P. gives for the year 1871–72 the receipts at 1,135,018 milreis; expenditure, 1,079,195 milreis; leaving a surplus of 55,823 milreis. The national debt, in 1873, amounted to £72,833,000.

Army and Navy.—The state of the finances prevents the organisation of an army containing the number of men fixed by law. The actual strength, in 1877, was reported at 1512 officers and 38,917 men. The troops in the colonies numbered 8500 infantry and artillery,

besides a reserve of 9500 men. The navy of P. numbers 22 steamers, with 154 guns, and of 3106 horsepower, and 25 sailing vessels, most of which are laid up. P. has 55 fortresses, the greater number of which are mere fortified castles. Among the more important are Elvas, S. Julians Cascaes, Pininhe, Almeida, and Valença. There are six orders of knighthood—viz., the Order of Christ, founded in 1319; St Benedict of Avis; the Tower and Sword, founded in 1459, and reorganised in 1808; Our Lady of Villa Viçosa, established in 1819; and the order of St John of Jerusalem, which was separated in 1802 from that of Malta. In addition to these, there is one civil service order, founded in 1288.

Religion, Education.—The Roman Catholic faith is the state religion; but all other forms of worship are tolerated. The Portuguese church is under the special jurisdiction of a patriarch, who is always a cardinal, and who is, to some extent, independent of Rome. P. is divided into three dioceses, which are presided over by the Cardinal Patriarch of Lisbon, the Archbishop of Braga, who is primate of the kingdom, and the Archbishop of Evora; and these, with the fourteen bishops, belong to the Grandeza, or higher nobility. The number of clergy holding cures is given at 18,000. The monasteries were dissolved in 1834, but a few religious establishments still exist. P. stands below the other countries of Europe in regard to education. There is one university at Coimbra; there are military, naval, trade, and navigation schools, and many classical and higher schools; and in 1874 there were in P. and its islands 2631 public schools, with 113,000 pupils, uncontrolled by the church. There is an Academy of Sciences and a School of Arts at Lisbon, the former of which has a library of 50,000 vols. The other public libraries are the Central Library, with 300,000 vols.; various royal libraries, as that of Lisbon, with 86,000 badly-preserved vols., and 8000 MSS.; that at the Necessidades Palace, with 28,000 vols.; and that at the Ajuda Palace, with 20,000 vols.; and the University Library at Coimbra, with 45,000 vols. The administration of the system of education is conducted by a superior council of education at Coimbra, under the supervision of the ministry of the Home Department.

Law, Government, &c.—The administration of the law is effected by means of 111 courts of justice, 6 of which are located at Lisbon, where also the high court of appeal holds its sittings. The courts are public, and in some cases trial by jury is adopted. Excepting in regard to suits referring to trade, law is still administered in accordance with the Alfonsine code of the 15th c., and the Código Filippino, or code of Philip IV. of Spain.

P. is a constitutional monarchy, the crown being hereditary alike in the female and male lines. The houses of representatives are called *Cortes*, and consist of the *Camaras dos Pares* and the *Camaras dos Deputados*, the former composed of grantees, chosen for life by the sovereign, and the latter of 179 members, elected by voters. The monarch is assisted by a cabinet of eight ministers of state, and a council composed of members chosen for life. He bears the title of King of Portugal and of Algarve 'on both sides of the ocean.' The heir-apparent bears the title of Prince of Beira. The winter residence of the king and court is the Palace dos Necessidades at Lisbon, which at other seasons is exchanged for the palaces at Mafra, Queluz, Bemfica, and Ramalhao. The nobility is divided into *Titulados* and *Fidalgos*; a very large number of the Fidalgos being impoverished and reduced to the condition of paupers, subsisting on charity. In 1864 the Cortes abolished hereditary succession to the peerage. The arms of P. are a silver shield bearing five small blue shields, set crosswise, each of which has five silver coins laid crosswise upon it, the whole being encircled by a red border

bearing seven golden castles—the arms of Algarve. The supporters are two dragons, bearing aloft the standards of P. and Algarve. The national colours are blue and white. Lisbon (q. v.), the capital, is the centre of the small amount of literary, artistic, and manufacturing activity in P.; while, besides Oporto (q. v.) there is no city whose population exceeds 20,000, and but nine which have more than 10,000 inhabitants.

Race.—The Portuguese are a mixed race. In Algarve and Alemtejo, the Arabic element is still very perceptible, and the people of those provinces have dark-brown skins, and tall, slim, but lithe and active figures; while the natives of the more northern districts, with lighter skins, have less regular features, small eyes, and short, thick-set figures. Although the Portuguese may very probably be regarded as the remains of the original population of the peninsula, they differ essentially from their Spanish brethren, whom they now regard with inveterate hatred and jealousy on account of their attempts a few centuries ago to annihilate the independence of Portugal. They indulge in interminable verbosity, ceremonious flattery, and servile politeness, and they are inclined to extravagance and display. They are, however, intensely patriotic, brave, persevering, enterprising, hospitable, cheerful, and ready to oblige. As a people, they are dirty and slovenly; few persons among them possess any great degree of mental culture, and the lower orders are even unable to read or write, and hence the grossest superstition and bigotry prevail in every class of the population.

History of Portugal.—The earliest notice which we have of the western portions of the Spanish peninsula, is derived from the Romans, who followed the Carthaginians as conquerors of the territories of the ancient Iberians and western Celts. Under Augustus, the peninsula was divided into three provinces, governed by prætors, of which the western province of Lusitania comprised the greater part of the present kingdom of P., besides portions of Leon and Spanish Estremadura. When the Romans withdrew from the peninsula, which was rapidly overrun by Visigoths from the north, and at a later period by Saracens from the south, Lusitania was overwhelmed in one common ruin with Iberia or ancient Spain. About the middle of the 11th c., it fell under the sway of Ferdinand I. of Castile. In 1095, Henry of Burgundy, who had married a natural daughter of Alfonso VI., king of Castile, the successor of Ferdinand, received from that monarch the government of Portugal from the Minho to the Tagus, as a dependent fief. It is maintained, however, by Portuguese authorities, that even from this time the country was independent. His son, Alfonso I., gained signal advantages over the Arabs, and, by his gallantry and prudence, secured the affections of the people. After the great victory which he gained over the Moslems, in the plain of Ourique, in Alemtejo, in 1139, his soldiers proclaimed him king. His successes on this occasion inflicted a serious check on the advance of the Infidels, and in recompense for the services which he had thus conferred on Christendom, the pope confirmed his title, which had been unanimously ratified by the Cortes of Lamego. The Burgundian House, which continued in possession of the throne for 400 years, gave to P. some of its noblest and best kings. The immediate successors of Alfonso I. were engaged in many severe struggles with the clergy and nobles, who were always ready to combine against the sovereign; but although often baffled in their attempts to uphold the independence of the crown, the dignity of the kingdom was, on the whole, well maintained by the

representatives of this family, who are, moreover, distinguished as the promoters and upholders of the maritime glory of Portugal. Dinis (Dionysius), who succeeded Alfonso III. in 1279, must be regarded as the founder of Portuguese commerce and mercantile enterprise. This king, moreover, encouraged the industrial arts, and protected learning, in furtherance of which he founded, in 1284, a university at Lisbon, which was transferred, in 1308, to Coimbra. Dinis was succeeded in 1325 by his son, Alfonso, surnamed the Brave, whose reign was almost wholly occupied in wars with the Castilians and the Moslems. With Alfonso's grandson, Ferdinand I., the legitimate branch of the Burgundian House became extinct in 1383. After some disturbances, his illegitimate brother, Joam (John), was recognised by the Cortes as king in 1385. His reign was eventful, not merely on account of the internal reforms which he introduced into the state, and of his steady maintenance of the prerogatives of the crown, but chiefly as being associated with the commencement of those vast and important geographical discoveries and commercial enterprises, to which P. owed the position she occupied during that and the succeeding age as the greatest maritime power of Europe. To Joam's son, Enrique (Henry) the Navigator, is due the merit of having organised various voyages of discovery, and inaugurated a regular system of colonisation, which, during the reign of Joam II. (who ascended the throne in 1481), culminated in the successive acquisition by P. of the Azores, Madeira, Cape de Verde, and other islands; in the doubling of the Cape of Good Hope under Bartholomeo Diaz; and, as the result of the latter, in the successful achievement of the passage by sea to India, which was effected, in 1497, under the command of Vasco de Gama, in the reign of Joam's successor, Manoel. The discovery of Brazil, and the settlements made there and on the western coast of India, increased the maritime power and fame of P., which were further extended under Manoel's son, Joam III., who ascended the throne in 1521. At this period, P. ranked as one of the most powerful monarchies in Europe, and Lisbon as one of its most important commercial cities. Sudden as this course of prosperity had been, its decline was almost more abrupt, and may in a great measure be referred to the influence of the priests, for the introduction into P. of the Inquisition in 1536, led to the expulsion of the numerous wealthy and industrious Jews, on whose able financial management the commercial interests of the Portuguese were largely dependent, and gave rise to an amount of social tyranny and oppression, both in the colonies and at home, which, coupled with a bad system of government, depressed the energy and crippled the resources of the nation. The influence of the Jesuits under the minority of Joam's grandson, Sebastian, and their evil counsels in urging the young king to enter upon a fatal expedition to Africa against the Infidels, led to still further miseries. The defeat of the Portuguese, and the capture and death of their young king at the battle of Alcazar in 1578, and the extinction of the old Burgundian line in 1580, after the brief reign of Sebastian's uncle, Enrique, plunged the country into difficulties and misfortunes of every kind, which lost none of their weight, although they changed in character. After a struggle for the throne between many eager candidates, none of whom found favour with the nation at large, who persisted in cherishing the delusive hope that Sebastian was still alive, and would return from the hands of his Infidel captors, Philip II. of Spain succeeded in securing to himself the crown of P., and annexing the Portuguese kingdom to the Spanish monarchy. This event proved disastrous

in the extreme to P., for, besides bringing the country to the brink of ruin, by mal-administration and misappropriation of its resources, it involved it in all the ruinous wars of Spain in the Low Countries and in Germany, a great part of the expenses of which it was made to bear; while the Dutch, in retaliation for Spanish aggressions at home, attacked the Portuguese settlements in Brazil, and almost completely deprived them of their possessions in the Indian Archipelago. The insolence of Philip IV.'s minister, Olivarez, brought matters to a crisis; and in 1640, after a forced union of 160 years, P. was freed, by a bold and successful conspiracy of the nobles, from all connection with Spain, and the Duke de Braganza, a descendant of the old royal family, placed on the throne, under the title of Joam IV. The war with Spain, which was the natural result of this act, terminated in 1668, when, by the treaty of Lisbon, the independence of P. was formally recognised by the Spanish government. For the next hundred years, P. vegetated in a state of inglorious apathy. Her ancient glory had departed never to return, the nation was steeped in ignorance and bigotry, and from having been one of the greatest maritime powers of Europe, the Portuguese were content with becoming a commercial dependent, rather than ally, of Great Britain. Under the reign of Joseph I., who died in 1777, the genius and resolution of the minister, Pombal (q.v.), infused temporary vigour into the administration, and checked for a time the downward tendency of the national credit. Pombal's efforts to rouse the people from their sloth, and infuse vigour into the government, were frustrated by the accession of Joseph's daughter, Maria, who, with her uncle-husband, Pedro III., allowed things to fall back into their old channels. The mental alienation of Maria led, in 1789, to the nomination of a regency under her eldest son, Joam. This prince, who shewed considerable capacity in early life, finding that he could not maintain even a shadow of independence on the outbreak of the war between Spain and France, threw himself wholly on the protection of England; and finally, when he learned that Napoleon had determined on the destruction of his dynasty, left P. in 1807, accompanied by all his family, and transferred the seat of his government to Rio Janeiro, the capital of Brazil. This act was immediately followed, on the part of the French, by the occupation and annexation of P.—a measure which gave rise to the Peninsular War. The victory of Vimeira, gained by the combined English and Portuguese army in 1808, freed the land from its French assailants; and in 1810, on the death of Queen Maria, the regent succeeded to the joint crowns of P. and Brazil. The continued residence of the new king, Joam VI., at Rio Janeiro, gave occasion to abuses and discontent, which resulted, in 1820, in the outbreak of a revolution at Lisbon, and the proclamation of a constitutional form of government in the place of the pre-existing absolutism. After a period of great national excitement and political disturbance, the differences between the sovereign and people were so far adjusted, that Joam agreed to and signed the constitution of P., and ratified the independence of Brazil, which was to be governed by his son, Dom Pedro, while he himself retained only the title of emperor. On the death of Joam in 1826, Pedro IV., after organising the government of P. on the model of the French charter, renounced the Portuguese crown in favour of his daughter, Dofia Maria da Gloria, on condition of her marriage with her uncle, Dom Miguel. The latter, who, during the lifetime of Joam, had availed himself of

every opportunity to thwart the more liberal policy of his father and brother, waited only for the embarkation of the English troops to break the oath which he had taken to maintain the constitution, and gathering round him all who were in favour of restoring the old order of things in P., he was through their aid declared king by the Cortes, which met in June 1823. A period of indescribable confusion, misrule, and anarchy followed. The nobles, monks, and rabble ruled the land; 13,000 Portuguese citizens went into exile, while double that number of persons, suspected of favouring the Constitutional party, were kept in confinement. At length, in 1832, Dom Pedro was enabled, chiefly by means of a loan from Englishmen, to raise a fleet, and make a landing at Oporto. Admiral Napier, in the meanwhile, operated on the coast of Algarve successfully in favour of the young queen, whose cause, by these victories, and the support of an alliance with the great powers, finally proved victorious. Doña Maria made her entry into Lisbon in 1833; and in the following year Dom Miguel signed the Convention of Evora, by which he renounced all pretensions to the throne, and agreed to quit Portugal. The death of Dom Pedro in the same year, after he had effected several important reforms, proved a heavy misfortune to P., which suffered severely from the mercenary rule of those who occupied places of trust about the person of the young queen. Her marriage, in 1835, with Augustus, Duke of Leuchtenberg, his death at the end of a few months, and her second marriage, in 1836, with Prince Ferdinand of Saxe-Coburg, were followed by grave political disturbances, which in course of time were aggravated by the personal avarice and want of good faith of those in whom the young queen placed her confidence. A branch of the democrats, known as the Septembrists, from the month in which they made their first decisive stand against the government, loudly demanded the abrogation of the charter promulgated by Dom Pedro (and known as the *Carta de ley de 1826*), and the restoration of the constitution of 1820. This contest of the charters may be said to have continued through the entire reign of Doña Maria. The government was alternately in the hands of Septembrists and Chartists, towards both of whom the queen acted with a degree of duplicity that frustrated every effort at an adjustment of the national disorders. Insurrections and counter-insurrections were of frequent occurrence, the troops were not to be depended on in moments of emergency; guerrilla bands scoured the country at will, and openly defied the queen's authority. The Absolutists, or Miguelites, took advantage of the general disorder to produce a reaction in favour of the old church party. The financial embarrassments were complicated in the extreme; while the obstinacy of the nation in regard to the maintenance of the slave-trade, in defiance of treaties and pledges, brought them into temporary collision with Great Britain, the only ally on whom Doña Maria could rely. An armed intervention of the great powers in 1847 produced a partial abatement of the national disorders; and matters might have permanently improved, had not the queen's partiality for her unpopular ministers, Count Thomar and his brother Cabral, and her determination to leave the administration of affairs in their hands, exasperated the general discontent and distrust of the court, and led to the insurrection, which, without bloodshed, made the national idol, the Marquis de Saldanha, *de facto* military dictator of Portugal, and evoked a general expression of the popular wish for the queen's abdication. Saldanha's ministry, although begun under good auspices, soon manifested the

same readiness to succumb to the views of the court which had characterised former ministries. One Cortes was dissolved after another, and finally, in 1852, the government declared itself prepared to carry out necessary reforms without the concurrence of the Cortes, and to demand at a future period a bill of indemnity for its acts. At this crisis, the queen died suddenly, and her eldest son ascended the throne in 1853, as Pedro V., under the regency of the king-consort his father. The latter used his power discreetly; and by his judicious management, the financial disorders were partially adjusted. Upon the sudden death, in 1861, of Pedro, his brother was proclaimed king as Luis I. He has steadily adhered to constitutional principles, and aims at the internal improvement of the country; and in spite of frequent ministerial crises and continued financial difficulties, the resources of the country are developing. When the insurrection of General Prim broke out in Spain, the Portuguese Chambers declared unanimously against any proposals for an 'Iberian Union.'

PORTUGUESE LANGUAGE AND LITERATURE. The Portuguese, like every other branch of the Romance family of languages, has grown out of a local form of the *Lingua Romana Rustica*, which in course of time had grafted upon it many elements of Arabic from the Saracen invaders of the country, and numerous verbal and idiomatic characteristics of the Frankish and Celtic dialects, which were introduced with the Burgundian founders of the Portuguese monarchy. The earlier forms of Portuguese bore close affinity with the Galician, and although, in course of time, it presented strong resemblance to its sister language, the Castilian, in as far as both possessed numerous words of identical origin, it differed so widely from the latter in regard to grammatical structure, as almost to merit the designation of an original tongue. The antipathy existing between the Portuguese and Spaniards, and the consequent strenuous efforts of their best writers to keep their language distinct, and to resist the introduction of further Castilian elements, had the effect of making Portuguese still more dissimilar from the sister tongues of the peninsula, and the result is the production of a language differing from pure Spanish in having an excess of nasal sounds, and fewer gutturals, with a softening or lisping of the consonants, and a deepening of the vowels, which renders it the softest, but least harmonious, and the feeblest of all the Romance tongues. The earliest specimens of genuine Portuguese belong to the beginning of the 13th c., and consist for the most part of collections, or books of songs (*Cancioneiros*), which, both in regard to form and rhythm, resembled the troubadour or *minne* songs of the same period. Of these, the oldest is the *Cancioneiro del Rei Dom Diniz*, or Book of Songs, by King Diniz, who had long been regarded by the Portuguese as their earliest poet, but whose poems were supposed to be lost, till they were discovered, about twenty years since, in MS. in the library of the Vatican, and published at Paris and Lisbon in 1847. In the 14th and 15th centuries, the court continued to be the centre of poetry and art, as it had been under Diniz; but Castilian was in greater vogue than Portuguese, which was despised by the numerous royal poets, who emulated the example of Diniz, and composed love-songs and moral or didactic poems. Under the culture of these noble bards, the poetry of Portugal remained weak and effeminate, without acquiring even the tenderness and pathos which characterised the Spanish romances of that age. The poetry and literature of Portugal acquired new vigour with the growth of her maritime and commercial glory, and the *Cancioneiro Geral* (Lisb. 1516)

of the poet Garcia de Resende, which gives a general summary and extracts of all the Portuguese poets of the latter half of the 15th, and beginning of the 16th c., affords evidence of this improvement, which is most strongly exemplified in the sentimental pastorals or romances, and the national eclogues of Bernardino Ribeiro and Sá de Miranda, whose eclogues and prose dramatic imitations of Plautus and Terence, mark the transition period between the mediæval lyrical and the later classical style. These first attempts at the drama were followed by Antonio Ferreira, whose *Ines de Castro* is the oldest Portuguese tragedy. But the classical school, whose chief cultivators were the courtiers of Lisbon and the professors of Coimbra, found little favour among the people at large, for the discoveries and conquests of the nation in Asia, Africa, and America, excited an enthusiasm and self-consciousness in the people, which led them to crave for something more practical and natural than the stilted style of the classicists. At this crisis, when P. was at the zenith of her material prosperity, appeared her greatest poet, Camoens, who, in his immortal epic, *Os Lusíadas*, which appeared in 1572, struck out a new path in the domain of epic poetry; while his numerous sonnets, 300 in number, his *Canções* or songs, his *Redondillas*, dramas, and other poetic productions, exhibit a versatility of genius and graceful tenderness which place him in the foremost rank of European poets.

With Camoens and his contemporary, Gil Vicente, the language and poetry of P. reached the culminating point of their development. During the dominion of Spain, the Portuguese so far lost all feeling of national independence and patriotism, that they at length renounced their native tongue, and adopted the language of their foreign rulers. With the restoration of political independence, under the sway of the Portuguese House of Braganza, a reaction took place; but the 17th and 18th centuries produced few Portuguese writers who attained more than an ephemeral and purely local reputation—bombast, or slavish imitation of Spanish and Italian writers, being the predominant characteristics of the Portuguese school of light literature. Some good historical writers belong, however, to this period, as Jacinto Freire de Andrade, whose life of Joao de Castro, Viceroy of India, still holds its place as the most perfect monument of classical prose; the great Indian missionary, the Jesuit Father Antonio Vieira, who died in 1699, and whose sermons and letters—of which a collection was published at Lisbon in 1748, and at Paris in 1838—are regarded by his countrymen as models of style and diction; F. X. da Meneses, the author of *O Portugal Restaurado* (1741), &c. In the beginning of the present century, Portuguese poetry was partially redeemed from its previous low grade by two men, who, although they professed to observe a strictly classical style, possessed a delicacy of taste, and a genial creative power, which saved them from falling into the absurdities that had generally characterised the school in Portugal. The elder of these, F. M. do Nascimento, who died in exile at Paris in 1819, although specially noted as an elegant lyricist, deserves notice for his gracefully written miscellaneous papers; while Manoel de Bocage, his less cultivated rival and contemporary, must undoubtedly be regarded as the most original and truly national of the modern poets of Portugal. His sonnets rank as the finest in the language, and these, with his numerous idylls, epigrams, and occasional poems, composed in various styles and modes of versification, have had a host of imitators, among the best of whom are the dramatist J. B. Gomes, J. M. da Costa e Silva; the satirist, T. da

Almeida; and the Brazilian, Antonio Caldas, distinguished for his sacred epics, and various imitations of Milton and Klopstock. The best of the recent Portuguese poets are M. de Albuquerque, A. de Castilho, and A. de Carvalho, and J. B. d'Almeida Garrett. The last-named, whose collected poetic and prose works appeared at Lisbon in 1840, was at once the most versatile and popular writer of his time in Portugal. In the departments of travels, geography, and history, P. has produced good writers from the earliest periods of its literary history; and in recent times, the works of B. Machado, J. Ferreira, and A. de Cajo, have well maintained the national reputation.—Portuguese literature is also cultivated in Brazil, and, of late years, with more success than in the parent country. The principal names in Brazilian poetry are, Gonçalves Diaz, Macedo Abreo, and Magalhaens; in history, Varnhagen, author of the *Historia general de Brazil* (1854), and P. da Silva, author of the *Brazilian Plutarch*; besides some divines, philosophers, and translators from the classics.

PORTULACEÆ, or **PORTULACACEÆ**, a natural order of exogenous plants, nearly allied to *Caryophyllaceæ*, from which it differs chiefly in the generally perigynous stamens, the calyx consisting of two sepals which are united at the base, and the capsule frequently opening transversely. The species are not very numerous; they are much diffused over the world, and are shrubby or herbaceous, generally succulent, mostly growing in dry places. The flowers are often large and beautiful, but ephemeral. The foliage is bland and insipid. Some species are used as salads and pot-herbs, of which the best known is Purslane (q. v.). The tuberous roots of *Claytonia tuberosa*, a Siberian plant, are used for food, as are those of the Mellico (*Mellica tuberosa* or *Ullucus tuberosus*), a Peruvian plant sometimes referred to this order. The genus *Calandrinia* furnishes some beautiful annuals to our flower-borders.

POSEI'DON. See **NEPTUNE**.

PO'SEN, a province of Prussia, bounded N. by Pomerania and East Prussia, E. by Poland, S. by Silesia, and W. by Brandenburg and Pomerania. Area, 11,260 square miles. Pop. at the close of 1880 1,703,397. It is divided into the two governmental districts of Posen and Bromberg; and the principal towns are Posen, Bromberg, Gnesen, Lissa, and Inowracław. The principal river is the Wartha, which traverses P. from east to west, and is navigable throughout the greater part of its course, as is also the smaller Netze. The country is almost everywhere level, and its surface extensively covered with bogs, ponds, and small lakes. The soil is on the whole fruitful, and the numerous swamps and forests which covered the land during its annexation to Poland, have of late years been converted into rich meadow and good arable land, where cattle of superior quality are raised, and good crops of wheat, barley, oats, and flax are procured. The forests are extensive and productive, and contribute largely to the exports of the province, of which, however, the most important articles are corn, wool, tallow, hides, wax, and honey. With the exception of coal, which is obtained from beds near the town of Wronki, P. has no mineral products. Good broad-cloth, linens, and lace are manufactured in many of the small country-towns. Since the annexation of P. to Prussia, much has been done to supply the previous deficiency in regard to popular instruction; and there are now six gymnasia, several normal and training schools, a seminary for priests, and upwards of 2000 burgher and national schools. Nearly half the entire

population belong to the Roman Catholic Church, which is under the spiritual jurisdiction of the Archbishop of Gnesen and P., while 74,000 of the remainder are Jews. The inhabitants may still be said to be Poles, more than 800,000 persons employing Polish as their mother-tongue. P. formed an integral part of Poland till 1772, when, at the first partition of the Polish territory, the districts north of the Netze were given to Prussia. At the second and third partitions, which were made 20 years later, the remainder was incorporated in the Prussian kingdom under the name of South Prussia. In 1807, P. was included in the duchy of Warsaw; but by the act of the Congress of Vienna, it was separated in 1815 from Poland, and re-assigned to Prussia under the title of the Grand Duchy of Posen. In 1848, the Poles, who had never amalgamated with their new German compatriots, took advantage of the general political excitement of that period to organise an open rebellion, which gave the Prussian government considerable trouble, and was not put down till much blood had been spilled on both sides. On the cessation of disturbances, the German citizens of the province demanded the incorporation of P. with these Prussian states which were members of the German Confederation, and the Berlin Chambers gave their approval of the proposed measure in 1850; but on the subsidence of revolutionary sentiment in Germany, the subject was dropped, and P. returned to its former condition of an extra-German province of the Prussian monarchy.

POSEN (Polish *Poznan*), the chief town of the province of Posen, is situated on the low and sandy banks of the Wartha, 126 miles south-east of Stettin, on the Stettin and Vienna railway. Pop. at the close of 1880, 64,733, besides about 8000 troops. P., which ranks as one of the most ancient cities of Poland, became the seat of a Christian bishop in the 10th c., and was a member of the Hanseatic League during the middle ages, when it was an important trading mart between Western Europe and the Slavonic lands bordering on Asia. At the time of the great fire of 1803, when many of the older parts of the town were destroyed, P. lost the most striking features of its semi-oriental style of architecture, but it still retains a certain picturesque character, from the number of its church towers and lofty houses. Among its 15 principal churches, the most noteworthy are the cathedral, a recently restored and elaborately ornamented building, and St Stanislaus, a splendid specimen of Italian architecture. P., which is strongly fortified and enclosed within gates, has several pleasant suburbs, connected with it by means of wooden bridges. It is the see of an archbishop, the seat of the provincial government, and has a fine town-hall, two gymnasia, a public library with 20,000 volumes, training-schools for teachers of both sexes, a school for midwives, a theatre, &c. Recent restorations and improvements have rendered it one of the pleasantest-looking towns in Prussia, and it can now boast of many fine regularly built streets and squares, in which are situated the winter residences of many of the provincial Polish nobles. A considerable trade in wood, corn, wool, broad-cloth, and linen, is carried on here, principally by the Jews, and the annual fairs held in summer attract large crowds, including the nobility of the province. The chief manufactures, which are extensively sold at these fairs, are cloth, leather, carriages, copper vats and other vessels used in distilling, and tobacco; while there are likewise several breweries, distilleries, and sugar-refineries.

POSES PLASTIQUES (Fr. 'statuesque attitudes'), equivalent to Tableaux Vivants (q. v.).

POSILI'PO, a mountain on the north-west of Naples, close by the city, remarkable for the tunnel known as the Grotta di Posilipo, through which the road from Naples to Puzzuoli (anc. *Puteoli*) passes. The grotto is in some places 70 feet high, and 21 feet wide, and is 2244 feet long. It is very ancient. Seneca mentions it as the *Crypta Neapolitana*. Strabo assigns its construction to M. Cocceius Nerva, superintendent of aqueducts in the time of the Emperor Tiberius. Above the eastern archway of the grotto is the so-called 'Tomb of Virgil.' At the base of the hill of P. anciently stood the poet's villa, in which he composed the *Eclogues* and *Georgics*, if not also the *Æneid*. During the middle ages, the common people firmly believed the grotto to be the work of the poet, whom they regarded as a great magician.

POSITIVE PHILO'SOPHY. See COMTE.

POSITIVE PRINTING, in Photography. This term is used to designate that process by which impressions from a Negative (q. v.) are produced upon suitably prepared paper. The term, however, does not belong exclusively to positives produced on paper, and intended to be viewed by reflected light, since transparent positives for examination by transmitted light are produced on glass. The means by which this kind of positives is obtained are so exactly similar to the dry negative collodion process, that a detailed notice thereof is hardly necessary in the present article, which will be confined exclusively to the means of obtaining positive proofs on paper.

Regarding, then, the negative, not so much as the picture as the means of producing one, the first thing which presents itself for notice is the paper. This may be either German or French, known in the markets under the respective names of Saxe and Rive. They are used in the simply salted condition, or more generally in the salted and albuminised state, the purpose of the albuminising being to prevent the chemicals used in the process from sinking into the paper, whereby the delicate details of the negative would become defective on the surface. The process is briefly as follows: Float the paper on the salting bath from one to five minutes; drain for one minute; hang up to dry. Float the paper on the exciting bath from five to ten minutes, according to its strength; drain, and hang up to dry. Expose in a pressure-frame under a negative. The necessary depth of impression, being obtained (a point only to be determined by experience), wash the print in common water. Some operators at this stage immerse the print in a bath containing one per cent. of ammonia for two or three minutes. This is by no means absolutely necessary; should it, however, be done, it should be afterwards washed in water for five or ten minutes; after which it is immersed in the toning bath from one to ten minutes, or until the desired tone be obtained; it is then rinsed in water for one minute, preparatory to immersion in the fixing bath. This last operation occupies from fifteen to thirty minutes, according to the strength of the fixing solution, and the depth to which the printing has been carried. The print is then copiously washed in many changes of water, and hung up to dry.

The baths referred to above are composed as follow: *Salting Bath*, water, 1 ounce; albumen, 4 ounces; good common salt, 48 grains. *Exciting Bath*, nitrate of silver, 240 grains; water, 4 ounces; glacial acetic acid, half a dram. *Toning Bath*, chloride of gold, 4 grains; water, 24 ounces; carbonate soda, 100 grains. *Fixing Bath*, hyposulphite of soda, 4 ounces; water, 1 pint.

The outlines of a new printing-process have recently been given to the world, which, for facility of manipulation, bids fair to supersede all others. The process is patented; it consists in coating good photographic paper with collodion, having salts of uranium and silver dissolved therein; the paper is then dried in the dark, when it is ready for printing. No *over-printing* is necessary, as no subsequent reduction takes place in the after-processes of toning and fixing. The toning is effected by immersion in a solution of chloride of gold, palladium, or platinum; by the use of which salts, and by varying the proportion of uranium in the collodion, also by varying the time of exposure, and the density of the negative, any desired tone may be obtained. Absolute permanency is claimed as one of the qualities of pictures printed by this process; this is, however, a point which time alone can determine.

A process of printing in carbon, lamp-black, or other impalpable powder, although still surrounded by some manipulatory difficulties, possesses too many of the conditions calculated to insure that important desideratum, permanency, to be passed over without notice. The principle was first indicated by Mungo Ponton, and experimented upon by Swan and others. In Swan's process an impalpable powder of lamp-black is intimately mixed with a solution of gelatine and bichromate of potash. A uniform layer of this mixture is spread on paper and allowed to dry. It is then removed from the dark room where it was prepared, and exposed under a negative from four to eight minutes. A transfer of the print is now effected by coating it with a solution of gutta percha in benzole, and applying to it a sheet of paper similarly coated, the two surfaces being made to adhere by pressure under a roller. The now double sheet is soaked in water for five or six hours until the paper which formed the first ground of the print is removed. That part of the gelatine which has been rendered insoluble, by the influence of the light on the bichromate, adheres, with infinite gradations of depth, to the last applied sheet, and the rest washes off with the first paper. The print by this transfer has been turned over, the object being to retain the original surface, which had received most intimately the action of the light, and to remove that portion which, owing to the opacity of the pigment, had been but imperfectly affected. The excellent result of this transferring process, supplemented by Mr Swan to the earlier methods, is shown in the perfect retention of the finest tints. See Photo-galvanography, in article PHOTOGRAPHY.

POSSÉ COMITATUS means the whole force of the county, consisting of knights and men above the age of 15, with constables, who attend the orders of the sheriff to assist in enforcing process or quelling riots. Justices of the peace can also, if apprehensive of an organised resistance, command the services of the posse comitatus, and it is the sheriff's duty to raise the necessary number of men. But practically, in modern times, constables and special constables are all the assistance given or required.

POSSESSION OF PROPERTY, in point of law, is the most intimate relation that can subsist between the owner and his property. Strictly speaking, the idea of property consists merely of a certain relation between a human being and a portion of external nature, whereby he appropriates to himself all the ordinary uses of which such external nature is capable. If it is land, he reaps the fruits, and excludes all other persons from interfering with his operations; if it is a chattel, he keeps it under his exclusive control. Possession, therefore, is nothing but the legal result of the relation of property. Possession, though originally constituting

the whole substance of property, has, as civilisation advanced, become a separable part of it; and while the radical right is now the ownership, the possession is viewed as an incident of such ownership. It is now not only separable but saleable, and constitutes the foundation of the contract between landlord and tenant, whereby the owner, by way of a lease, sells for a limited period the exclusive use, otherwise called the possession. So long, therefore, as an owner exists, he has, as a necessary consequence, the right, more or less immediately and directly, to the possession of property. When all record of ownership is lost, then the law permits a resort to first principles, and allows any person who has been in possession for a limited time to retain it, and so ultimately acquire the ownership. If the possession is suddenly or wrongfully interfered with, the usual remedy, in England, to recover possession of real property, such as land or houses, is an action of ejectment; if the property is a chattel, it is an action of trover or detinue. But the possession may be recovered also by other modes. See also OWNERSHIP and LOST PROPERTY.

PO'SSET, a dietetic preparation, made by curdling milk with some acidulous liquor, such as wine, ale, or vinegar. White wine or sherry is usually preferred, but sometimes old ale is used. The milk is boiled; and whilst it is still on the fire, the acidulous matter is added; if sherry, about a wine-glassful and a half to the pint of new milk is the proportion; or twice the quantity if ale. A teaspoonful of vinegar or of lemon-juice is sometimes used instead; one or two tablespoonfuls of treacle are added, to sweeten. Taken at bedtime, it is used for colds and coughs.

POST-CAPTAIN, an obsolete title applied to captains in the royal navy: it has been disused for many years. See CAPTAIN.

POSTE RESTANTE (Fr., to remain at the post-office till called for), a usual mode of addressing letters to persons who are merely travelling in, or passing through, a country in which they have no fixed residence. English travellers on the continent have very generally their letters so addressed to some town through which they expect to pass. The *poste restante* office is open at certain hours, and the letters are given out when called for, production of a card, passport, or other evidence of identity being sometimes required. Letters unclaimed for a certain time are opened, and either destroyed or returned to their writer. There is a *poste restante* office in London, under stringent regulations as to the conditions on which letters are given out. If the applicant for a letter be a British subject, or subject of a state not issuing passports, he must state the place from which he expects letters, and he, or the messenger who applies for him, must be provided with some proof of identity. If he be the subject of a country which issues passports, his passport must be produced. In the provincial post-offices of Great Britain, commercial travellers, tourists, and persons without a settled residence, may have their letters addressed *poste restante*, and they are kept at the post-office till called for; but residents are not allowed to have their letters so addressed, and the post-office authorities have orders to deliver them. In the British post-office, letters addressed *poste restante* are kept one month, and then returned to the writer through the dead-letter office.

POSTERN, in Fortification, is a small doorway communicating usually through the flank of a bastion between the fort and the ditch. Its object is to afford unseen egress to troops marched out to relieve sentries on the external works, to make

sallies, &c. The postern is often called the 'sally-port.'

POSTING, the forwarding of passengers from place to place by means of relays of horses. The application of the same words—post and postmaster—to the transmission of letters and to the stations where post-horses are kept, is, both on the continent of Europe and in Britain, a source of ambiguity. Posting was long in Britain, as it is yet in most parts of the continent, a government monopoly. A statute of Edward VI. fixed the charges of posting at 1*d.* per mile in 1548. The post-office act of 1656 confirmed the monopoly of furnishing post-horses for travellers in favour of the postmaster and his deputies; for a long time past, however, posting has been in the hands of private individuals. Post-chaises were first used in France, and introduced into England in the early part of last century. The payment is estimated per mile for each pair of horses, without regard to the number of persons conveyed; and a second pair of horses is charged at the same rate as the first.

Over the continent generally, posting is managed by the state, which retains the monopoly of supplying post-horses, and usually of forwarding the mails and diligences. The prices are fixed by government, as well as the number of horses that may be employed, which is regulated by the weight and number of persons conveyed.

POSTIQUE, an ornament in sculpture, marble, &c., applied or added after the work is otherwise finished.

POST-NUPTIAL CONTRACT means, in Scotch law, an agreement, or, as it is called in England, a settlement, made between husband and wife after the marriage has taken place, with a view to affect the property of the parties, and generally to make provision for the wife and children. As a general rule, a post-nuptial settlement is not so effectual as an ante-nuptial settlement in securing the rights of a wife, because in the former case the marriage is considered a valuable consideration in point of law, and puts it on the footing of a sale. Nevertheless, if the husband is quite solvent, he and his future creditors will be bound by the provisions of a post-nuptial contract. See **HUSBAND AND WIFE**.

POST-O'BIT is a bond or security given by heirs and others entitled to reversionary interests, whereby, in consideration of a sum of money presently advanced, the debtor binds himself to pay a much larger sum after the death of some person, or of himself. Whenever, as is not unusual, the payment is uncertain, and depends on the obliger outliving somebody else, very high interest is required, or rather a very much larger sum is agreed to be repaid than what is advanced. These are generally usurious bargains; but the obligee or creditor can enforce payment of the full amount; though, if there is a gross case of inadequacy in the proportions amounting to fraud, a court of equity will interfere.

POST-OFFICE, a place for the reception of letters, and the management of the various departments connected with their dispatch and conveyance. The name originated in the posts (from Lat. *positum*, placed, fixed) placed at intervals along the roads of the Roman empire, where couriers were kept in readiness to bear dispatches and intelligence; but the posts of ancient times were never used for the conveyance of private correspondence. The first letter-post seems to have been established in the Hanse Towns in the early part of the 13th century. A line of letter-posts followed, connecting Austria with Lombardy, in

the reign of the Emperor Maximilian, which are said to have been organized by the princes of Thurn and Taxis; and the representatives of the same house established another line of posts from Vienna to Brussels, connecting the most distant parts of the dominions of Charles V. This family continue to the present day to hold certain rights with regard to the German postal system, their posts being entirely distinct from those established by the crown, and sometimes in rivalry to them.

In England, in early times, both public and private letters were sent by messengers, who, in the reign of Henry III., wore the royal livery. They had to provide themselves with horses until the reign of Edward I., when posts were established where horses were to be had for hire. Edward IV., when engaged in war with Scotland, had dispatches conveyed to his camp with great speed by means of a system of relays of horses, which, however, fell into disuse on the restoration of peace. Camden mentions the office of 'Master of the Postes' as existing in 1581, but the duties of that officer were probably connected exclusively with the supply of post-horses. The posts were meant for the conveyance of government dispatches alone, and it was only by degrees that permission was extended to private individuals to make use of them. A foreign post for the conveyance of letters between London and the continent seems to have been established by foreign merchants in the 15th c.; and certain disputes which arose between the Flemings and Italians, regarding the right of appointing a postmaster, and were referred to the privy-council, led to the institution of a 'chief-postmaster,' who should have charge both of the English and the foreign post. Thomas Randolph was the first chief-postmaster of England. The first proper postal communication for private letters in England came into operation 100 years after the institution of the foreign post. The increased intercourse between the English and Scottish capitals, brought about by King James's accession, led to a great improvement in the system of horse-posts, but their services were still confined to the conveyance of government dispatches. That king, however, instituted a foreign post for letters going abroad from England, and conferred the office of postmaster of England for foreign parts on 'Mathewe de Quester the elder, and Mathewe de Quester the younger.' This appointment was considered by Lord Stanhope, the English chief-postmaster, to interfere with his functions, and a dispute and law-plea between the heads of the two establishments was settled in 1632, after Charles I. had become king, by the retirement of Lord Stanhope, and an assignment of their office by the De Questers, under royal sanction, to William Frizell and Thomas Witherings. In 1635, Witherings was authorised to run a post night and day between London and Edinburgh, 'to go thither and back again in six days.' Eight main postal lines throughout England were at the same time instituted, and the post was allowed to carry inland letters. Two years later, a monopoly of letter-carrying was established, which has been preserved in all the subsequent regulations of the post-office. The rates of postage were 2*d.* for a single letter for a distance less than 80 miles, 4*d.* up to 140 miles, 6*d.* for any longer distance in England, and 8*d.* to any place in Scotland. An attempt, in 1649, by the Common Council of London to set up a rival post-office for inland letters, was suppressed by the House of Commons. A practice of farming the post-office revenues, which began in 1650, continued, as regards some of the by-posts, till the close of last century.

An important post-office statute was passed

under the Protectorate in 1656, and re-enacted by 72 Car. II. c. 35. It ruled that there should be one general post-office and one postmaster-general for England, who was to have the horsing of all through posts and persons riding post. A tariff was established for letters, English, Scotch, Irish, and foreign, and the only non-governmental posts allowed to continue were those of the universities and the Cinque Ports.

In 1685, a penny-post was set up for the conveyance of letters and parcels between different parts of London and its suburbs. It was a private speculation, originating with one Robert Murray, an upholsterer, and assigned by him to Mr William Doewray. When its success became apparent, it was complained of by the Duke of York, on whom the post-office revenues had been settled, as an encroachment on his rights; a decision of the Court of King's Bench adjudged it to be a part of the royal establishment, and it was thereupon annexed to the crown. In this way began the London district-post, which was improved and made a twopenny-post in 1801, and continued as a separate establishment from the general post down to 1854.

The first legislative enactment for a Scottish post-office was passed in 1695, prior to which time, the posts out of Edinburgh had been very few and irregular. About 1700, the posts between the capitals were so frequently robbed near the borders, that acts were passed both by the parliament of England and that of Scotland, making robbery of the post punishable with death and confiscation. The post-office of Ireland is of later date than that of Scotland. In the time of Charles I., packets between Dublin and Chester, and between Milford-Haven and Waterford, conveyed government dispatches; and after the Restoration, the rate of letter-postage between London and Dublin was fixed at 6d.

Act 3 Anne, c. 10, repealed the former post-office statutes, and put the establishment on a fresh basis. A general post-office was instituted in London for the whole British dominions, with chief offices in Edinburgh, Dublin, New York, and other places in the American colonies, and one in the Leeward Islands. The whole was placed under the control of an officer appointed under the Great Seal, called the Postmaster-general, who was empowered to appoint deputies for the chief offices. Rates higher than those formerly charged were settled for places in the British dominions, and also for letters to foreign parts. A survey of post-roads was ordered, for the ascertainment of distances. Letters brought from abroad by private ships were ordered to be handed over to the deputy-postmasters of the ports, who were to pay the master a penny for each letter. A complete reconstruction of the cross-post system was effected in 1720, by Ralph Allen, postmaster of Bath, to whom the Lords of the Treasury granted a lease of the cross-posts for life: at his death, they came under the control of the postmaster-general. The rates of postage were further raised by act 1 Geo. III. c. 25, which also gives permission for the establishment of penny posts in other towns, as in London. The Edinburgh penny-post was instituted in 1766, by one Peter Williamson, a native of Aberdeen, whom the authorities induced to take a pension for the good-will of the concern, and merged it in the general establishment.

Mail-coaches owe their origin to Mr John Palmer, manager of the Bath and Bristol theatres, who, in 1783, submitted to Mr Pitt a scheme for the substitution of coaches, protected by armed guards, for the boys on horseback, who till then conveyed the mail. After much opposition from the post-office authorities, his plan was adopted, and Mr Palmer,

installed at the post-office as controller-general, succeeded in perfecting his system, greatly increasing the punctuality, speed, and security of the post, and adding largely to the post-office revenue.

In 1837, a plan of post-office reform was suggested by Mr (now Sir) Rowland Hill, the adoption of which has not only immensely increased the utility of the post-office, but changed its whole administration. Its principal features were the adoption of a uniform and low rate of postage, a charge by weight, and prepayment. The change met with much opposition from the post-office authorities, but was eventually carried by a majority of 100 in the House of Commons, becoming law by 3 and 4 Vict. c. 96. The new system came into full operation on January 10, 1840. Previously to the change, members of parliament had the right of sending their letters free, but this privilege of franking was entirely abolished. A penny was adopted as the uniform rate for every inland letter not above half an ounce. Facilities for prepayment were afforded by the introduction of postage-stamps, and double postage was levied on letters not prepaid. Arrangements were made for the registration of letters; and the money-order office, by a reduction of the commission charged for orders, became available to an extent which it had never been before. As far back as 1792, a money-order office had been established as a medium for sailors and soldiers to transmit their savings, and its benefit had afterwards been extended to the general public; but the commission charged had been so high, that it was only employed to a very limited extent. The immediate result of the changes introduced in 1840 was an enormous increase in the amount of correspondence, arising in part from the cessation of the illicit traffic in letters, which had so largely prevailed before; but for some years there was a deficit in the post-office revenue. The reduction of postage-rates was, however, a reduction of taxation, and if the Exchequer lost revenue from one source, it gained it in other ways.

Since the adoption of Sir Rowland Hill's system, the most important changes in the post-office are those which have arisen from the absorption of the whole traffic of the country by railways, and their substitution for mail-coaches in the conveyance of letters. This has greatly increased the expenses of the post-office establishment; notwithstanding which, the former gross revenue of the post-office was exceeded in 1851, and the net revenue in 1863.

According to the latest returns, there are 11,316 post-offices in the United Kingdom, of which 808 are head-offices, and 10,508 sub-offices. To these must be added a large number of road letter-boxes, making in all 14,776 public receptacles for letters—at least 10,000 more than existed under the former system. The total number of letters which passed through the post-office in 1863 was 642,000,000, an eight-fold increase from the last year of dear postage. The gross revenue of the post-office in 1863 was £3,800,000, to which should be added £130,000 for the impressed stamp on newspapers sent through the post; the expenditure £3,000,000, and the clear revenue £900,000. The amount of money transmitted by post-office orders in 1839 was £313,000; in 1863, £16,494,000.

The postal service of the three kingdoms is now under the immediate control of the postmaster-general, assisted by the general secretary of the post-office in London. There are also chief officers in Edinburgh and Dublin, with secretarial and other departmental staffs. The postmaster-general is a peer, a member of the privy-council, and generally a cabinet minister. He has a salary of £2500, and is the only officer connected with the department

who leaves office on a change of government. The secretary is his responsible adviser, and has a salary of £2000. The General Post-office in London is divided into seven principal departments, each under the charge of a chief officer; a similar arrangement, on a smaller scale, being adopted in the chief offices of Edinburgh and Dublin. These departments are: 1. The Secretary's Office, which exercises a surveillance over the rest. 2. The Solicitor's Office, which has to do with the legal business of the post-office. 3. The Mail Office, which deals with all matters relating to the transmission of the mails. Attached to, and under the management of this office, are the travelling railway post-offices, which accompany the mail-trains, and in which the letters are received and arranged during transit. At many stations, the letter-bags are received and dropped by means of machinery, while the train is going at full speed. 4. The Receiver and Accountant-general's Office, which keeps account of the money received by each department, receiving remittances from branch and provincial offices, and taking charge of the payment of all salaries, pensions, and items of current expenditure. 5. The Money-order Office, which conducts the whole money-order business of the country, receiving daily accounts from each provincial postmaster. 6. The Circulation Office, which takes charge of the ordinary post-office work of London—sorting, despatching, and delivering all the letters, newspapers, and book-packets arriving in London, sorting and despatching the greater part of the foreign mails, and arranging and forwarding a large proportion of the British letters *in transitu*. 7. The Post-office Savings-bank department, established in 1861 by act 24 Vict. c. 14. This department keeps a separate account for every depositor, acknowledges the receipt of every deposit, and on the requisite notice being furnished, sends out warrants authorising postmasters to pay withdrawals. The deposits are handed over to the Commissioners for the Reduction of the National Debt, and repaid to the depositors through the post-office. The rate of interest payable to depositors is $2\frac{1}{2}$ per cent. Each depositor has his savings-bank book, which is sent to him yearly for examination, and the accruing interest is calculated and allowed. The surveyors' department is the connecting link between the metropolitan and the provincial offices, each provincial postmaster being under the immediate supervision of the surveyor of his district. The number of officers employed in the British post-office, at the end of 1862, amounted to 25,380, of whom between 3000 and 4000 were attached to the general post-office in London.

One important and expensive part of the post-office establishment is the home and foreign mail-packet service. This department was, in the 17th and 18th centuries, in the hands of the post-office authorities, but was removed to the Board of Admiralty, under whose control it remained till 1860, when it was again restored to the post-office. Steam-vessels were first used for conveying the mail in 1821, and in 1833, mail-contracts were introduced, the first being with the Mona Steam Company to run steamers from Liverpool to Douglas in the Isle of Man. In 1839, a contract was entered into with Mr Samuel Cunard of Halifax, Nova Scotia, for a fortnightly mail across the Atlantic for £60,000 a year. Of the home mail-packet contracts, the most important are those with the City of Dublin Steam-packet Company for conveying the Irish mails between Holyhead and Kingstown. The principal foreign contracts are for the Indian and Chinese mails, entered into by the Peninsular and Oriental Steam-navigation Company, for which £253,000 is

paid annually. The foreign mail-packets travel no less than 3,000,000 miles every year, the average cost per mile being 6s. 4d.

The post-office statute of Queen Anne contains a prohibition, repeated in subsequent acts, for any person employed in the post-office to open or detain a letter, except under a warrant from one of the principal secretaries of state. During last century, such warrants were often granted on very trivial pretences. In 1723, at Bishop Atterbury's trial, copies of his letters, intercepted at the post-office, were produced in evidence against him; and in 1735, it appeared that an organisation existed, at an immense expense, for the examination of home and foreign correspondence. In 1782, the correspondence of Lord Temple, when Lord-lieutenant of Ireland, was subjected to a system of post-office espionage. In the beginning of the present century, an improvement took place in this matter, and Lord Spencer introduced the custom, in 1806, of recording the dates of all warrants granted for the opening of letters, and the grounds on which they were issued. Since 1822, the whole warrants have been preserved at the Home Office; and a House of Commons' return in 1853 shews that, in the preceding ten years, only six letters were detained and opened—four in cases of felony, and two that they might be properly returned to those who claimed them. One of these cases of interference with the privacy of correspondence occurred in 1844, when Sir James Graham, as Home Secretary, issued a warrant for opening the letters of Mazzini, and caused certain information contained in them to be conveyed to the Austrian Minister, an act which involved the ministry of the day in considerable popular obloquy, and produced a wide-spread, though very groundless, distrust of the security of the ordinary correspondence of the country. See GRAHAM, SIR JAMES.

The management of the Post-office Department of the UNITED STATES is assigned by the Constitution and laws to the Postmaster-general, who shall appoint three departments and the necessary clerks, and shall establish post-offices and sufficient postmasters to offices yielding not more than \$1000 per annum; provide for the carriage of the mail, superintend the disposition of the proceeds of the post-offices, regulate and direct the payments of advances to postmasters and expenses incident to the department according to law and subject to the settlement of the auditors. His salary is \$8000 per annum, and that of his three assistants \$3000 each.

According to the report of the Postmaster-general, there were, on June 30, 1870, 28,492 post-offices in operation in the U. States, being an increase of 1404 during the year. In 51 of the principal cities 97,811,831 mail letters, 21,797,849 local letters, and 27,867,023 newspapers were delivered, while the aggregate number of letters carried through the mail probably reached 700,000,000. During the year postage-stamps, valued at \$13,976,768, and stamped envelopes, letter and newspaper, valued at \$2,480,014, were sold, an increase of \$1,395,068 over the sales of 1869. The mail-routes in operation were 8861, of an aggregate length of 231,232 miles, and transporting the mails annually over 97,024,996 miles, at a cost of \$10,884,653, being an increase of 7501 miles over that of 1869.

After the completion of the railroad to the Pacific, 718 mails, or about 3 mails daily, were carried between New York and San Francisco—3307 miles—during the year ending Sept. 1870, at an average rate, going west, of 7 days, 7 hours, and 52 minutes; going east, of 7 days, 4 hours, and 44 minutes. Mails have been carried twice daily from New York to New Orleans by two routes at an average time of 3 days, 1 hour, and 40 minutes to 4 days and 30 minutes.

The total number of letters exchanged with foreign countries during the year ending June 30, 1870, was 18,359,378, an increase of 2,859,378, or 18.44 per cent., over that of 1869. Of these, 13,201,446 were letter correspondence with Europe. The total postage on letter-mails exchanged with foreign countries amounted to \$1,964,564, and the cost of the trans-Atlantic mail, in 1869, was \$336,207.

The ordinary revenue of the P. O. department for the year ending June 30, 1870, was \$19,772,220, and the expenditures of all kinds, \$23,998,837, an increase over those for 1869 of \$1,427,710, or 7.78 per cent., and \$300,706, or 1.32 per cent. The estimated expenditures for the year ending Jan. 30, 1872, were \$25,436,698, of which \$12,000,329 is for inland mail transportation; \$5,100,000 compensation to postmasters; \$1,500,000 payments to letter-carriers; \$400,000 for foreign mail transportation; \$159,000 for manufacture of adhesive postage-stamps; \$414,200 for manufacture of postage-stamps, envelopes, and newspaper-wrappers; and the estimated revenue, \$20,767,315; standing appropriation for free matter, \$700,000. Total, \$21,467,315, leaving a deficiency of \$3,969,383.

During the years 1869—1870 there were sent to the dead-letter office 3,932,045 domestic and 220,415 foreign letters; total, 4,152,460. These contained checks, drafts, deeds, &c., to the stated value of \$3,075,545, of which \$2,963,400 were secured to their owners.

In 1864 the money-order offices were authorized, by which it was made the duty of the deputy-postmaster at every money-order office to insure, in such manner and form as the Postmaster-general may prescribe, an order for a sum of money payable by the deputy postmaster of any other money-order office which the person applying may select; the deputy-postmaster who issues such order is also required to send through the mail, without delay, to the postmaster on whom it is drawn, due notice thereof, and he shall not deliver such order to the applicant therefor until the latter shall have first deposited with him the amount of money for which such order is drawn, together with the proper fee or charge therefor as provided by law. For \$1 and not exceeding \$10, 10 cents; for more than \$10 and not exceeding \$20, 15 cents; and for every order exceeding \$20 a fee of 20 cents shall be charged. The order cannot exceed \$30.

The number of money-order offices in operation on Oct. 27, 1870, was 2076, and the number of money-orders issued during the years 1869—70 was 1,671,253, of aggregate value of \$34,054,185, for which fees were received of the value of \$235,236. This exhibits an increase of 36.6 per cent. in the amount of the issues, and 37.6 per cent. in the amount of payments. The average amount transmitted was \$20.37. An international money-order system between the U. States and Switzerland was put in operation on Sept. 1, 1869, and 728 orders, valued at \$22,190, were issued payable in Switzerland, and 665 orders, valued at \$20,451, issued payable in the U. States. Negotiations are in progress for the establishment of international exchange of postal orders between the United States and Great Britain.

The wonderful growth of the United States in population and wealth is strikingly displayed in the rapid expansion of the postal system. In 1790 the number of post-offices was 75, the length of post-roads 1875 miles, the amount paid for transportation \$22,081; the gross postal revenues \$37,935, and the aggregate expenditures \$32,140. On July 1, 1870, there were 28,432 post-offices, the post-roads had extended to 231,232 miles; the amount paid for transportation had grown to \$10,884,653, the postal revenue to \$19,772,221, and the expenditures amounted to the extraordinary sum of \$23,998,838.

In 1790 a single letter was carried from Savannah to New York for 36½ cents; in 1870 for less than one-

twelfth of that sum. In 1790 the mails were conveyed three times a week from Boston to New York in summer-time, in winter occupying five days in the transit; and only two mails were exchanged between Philadelphia and New York, and required two days in each direction, and generally on the backs of horses. In 1870 three trips per day were made between Boston and New York, and six trips daily between Philadelphia and New York, of an average time of 8 hours for the former and 3½ hours for the latter, while the daily weight of the mails is from 15,000 to 20,000 pounds. During the first year of President Washington's administration 300,000 letters were probably transported; during the first year of President Grant's, upward of 700,000,000, besides an enormous amount of printed matter, weighing at least seven times as much as the letters, were carried an aggregate distance of 97,024,996 miles.

The international rate of letter-postage between the United States and Great Britain has recently been reduced from 12 to 6 cents. The rate between most of the states of Central Europe has recently been reduced from 15 to 10 cents in closed mails *via England*, and from 10 to 7 cents by *direct steamers* to Bremen and Hamburg. For the **BRITISH and FRENCH POST-OFFICE SYSTEM**, see former editions of this work.

The postage-stamps adopted by the P. O. department form an interesting subject of remarks. The one-cent stamp of Franklin is after Rubricht; the two-cent, of Jackson, after Powers; three-cent, of Washington, after Houdon; six-cent, Lincoln, after Volk; ten-cent, Jefferson, after Powers' statue; twelve-cent, Clay, after Hart; fifteen-cent, Webster, after Clevenger; twenty-four-cent, Scott, after Coffee; thirty-cent, Hamilton, after Ceracchi; ninety-cent, Com. O. H. Perry, after Wolcott's statue; and seven-cent stamp, of Edwin M. Stanton.

RATES OF POSTAGE ON PRINTED MATTER FOR FOREIGN COUNTRIES.—1. *To or from Great Britain*.—Newspapers and circulars, 2 cents each. Book-packets (including printed papers of all kinds, maps, plans, prints, engravings, drawings, photographs, lithographs, sheets of music, etc.), and patterns or samples, 6 cents per 4 oz. or fraction of 4 oz., if 4 oz. or over in weight. The above charges must be fully prepaid at the office of mailing, by means of U. S. postage-stamps affixed outside the packet or its cover, and are in full to destination in the United Kingdom. If not so prepaid, the packet cannot be forwarded.

2. *To or from the North German Union (including all the German States and Austria), and to or from Belgium and the Netherlands, by Closed Mail, via England*.—Newspapers, 4 cents each, if not exceeding 4 oz. in weight, and an additional rate of 4 cents for each additional weight of 4 oz. or fraction thereof; prepayment required. Book-packets, prints of all kinds, and patterns or samples, 3 cents for 1 oz. and under, 6 cents for 2 oz. and under, 8 cents for 4 oz. and under, and 8 cents for each additional 4 oz. or fraction thereof; prepayment required.

3. *To or from Italy and Switzerland, Belgium, and The Netherlands, by Closed Mail, via England*.—Newspapers, 4 cents each, if not exceeding 4 oz. in weight, and an additional rate of 4 cents for each additional 4 oz. or fraction thereof; book-packets, prints of all kinds, and patterns or samples, 8 cents for each 4 oz. or fraction thereof, except to Switzerland, when it is 2 cents for small book-packets and packets of samples of merchandise weighing 1 oz. or less, 4 cents for 2 oz. or less, and 8 cents when 4 oz. or less, and 8 cents for each additional 4 oz. or fraction thereof. If the postage on any article shall be insufficiently prepaid, it will be, nevertheless, forwarded to its destination, charged with the deficient postage, and subject also to a fine on delivery.

4. *To or from the North German Union (including*

all the German States and Austria), by *Direct Mail*, via *Bremen or Hamburg*.—Newspapers, if not over 4 oz. of weight, 3 cents each, and if 4 oz. an additional 8 cents for each additional weight of 4 oz. or fraction thereof, prepayment required. Book-packets, prints, patterns and samples, not over 1 oz., 2 cents, under 2 oz., 4 cents, under 4 oz., 6 cents, and for each additional 4 oz., 6 cents; prepayment required. The registration fee on registered letters or other postal packets is 8 cents to all the above-mentioned countries; prepayment of postage and fee compulsory.

INTERNAL NEWSPAPER POSTAGE IN THE UNITED STATES.—Postage on *Daily* papers to subscribers, when paid quarterly in advance, *per quarter* (3 months), 35 cents; six times a week, 30 cents; tri-weekly, 15 cents; semi-weekly, 10 cents; weekly, 5 cents. *Weekly* newspapers (one copy only) may be sent by the publishers within the county where printed and published, *free*. *Postage, per quarter* (to be paid quarterly or yearly in advance), on *newspapers* and *periodicals* issued less frequently than once a week sent to actual subscribers in any part of the U. States, semi-monthly, not over 4 oz., 6 cents; over 4 and not over 8 oz., 12 cents; over 8 and not over 12 oz., 18 cents. *Monthly*, not over 4 oz., 3 cents; over 4 oz. and not over 8 oz., 6 cents; over 8 oz. and not over 12 oz., 9 cents. *Quarterly*, not over 4 oz., 1 cent; over 4 oz. and not over 8 oz., 2 cents; over 8 oz. and not over 12 oz., 3 cents.

Newspapers, pamphlets, &c., must be wrapped or enveloped in covers, open at the sides or ends, so as to admit of the enclosures being removed for examination. Book-packets must not contain anything that is sealed, nor any letter, or communication of the nature of a letter, unless the whole of such communication be printed. No book-packet can exceed 2 feet in length, or 1 foot in width or depth. *Patterns or samples of merchandise* must not be of a salable nature or market value apart from their mere use as a pattern or sample, nor exceed the dimensions above-named, nor 24 oz. in weight. Patterns exceeding $7\frac{1}{2}$ oz. cannot be sent by mail to the Germany.

POST-OFFICE, OFFENCES AGAINST. Owing to the conspicuous part which the post-office plays in modern civilisation, a small code of laws belongs to it, the substance of which is as follows: Every person employed by the post-office who steals a post-letter, is guilty of felony; and if it contain money or a valuable chattel, the punishment is increased. So whenever letters are stolen by strangers out of the custody of the post-office or its officers. The moment a letter is put into the post-office or delivered to the postmaster, the protection of the statutes commences. Many nice questions have, however, arisen as to the application of the rule to special circumstances, and as to what constitutes an employment by the post-office. Whoever steals, secretes, or destroys printed papers or newspapers sent by post, commits a misdemeanour. So if a letter-carrier delay the delivery wilfully, except in the case where the person is dead, or the direction cannot be read, or the postage is neglected to be paid. Receivers of letters improperly taken, or stolen from the post-office, are guilty of felony. By the 1st Vict. 33, s. 2, any person conveying otherwise than by post a letter, not exempted from the exclusive privilege of the postmaster-general, incurs a penalty of £5 for every letter. This exclusive privilege of carrying letters extends to letters only, and not to printed books or newspapers. There are also exceptions to the general rule, that letters can only be sent by the post-office. Thus, one may send a letter by a private friend, and not by the post-office. So letters sent by messenger on purpose on the private affairs of the sender or receiver, commissions and legal

writs, merchants' letters sent by vessels or along with goods, are excepted. But no person is authorised to collect and send these excepted letters, though in the legal manner described, for this is doing the work of the post-office. Moreover, there are certain persons expressly prohibited from carrying letters even gratuitously, as common carriers, except the letters relate to goods in their carts or wagons; owners, masters, or commanders of ships, except such letters relate to goods on board; and passengers on board ships; and it is an indictable offence to contravene the statute.

POST-OFFICE INSURANCE. See SUPPLEMENT in Vol. X.

POSTULATE. This word occurs in Geometry, and signifies something that is *demanded*, and must be granted before the demonstrations of the science can be wrought out. The postulates of Euclid have reference to certain constructions indispensable to the reasoning. They are these three: 'A straight line may be drawn from one point to another;' 'A line already drawn may be produced;' and 'A circle may be described from a given centre, with a given radius.' The object of laying down these in the shape of demands, is to fulfil one great condition of demonstrative science, which is, that nothing shall be proceeded on, in the course of the reasoning, without being explicitly stated at the outset. It has been noticed by critics that the three postulates of Euclid do not exhaust the demands actually made in the course of his demonstrations. Thus, in the 4th and 5th Propositions, Book I, this postulate is assumed: 'Any figure may be removed from place to place without alteration of form, and a plane figure may be turned round on the plane.'

The postulate is something different from the axiom. An axiom is a general and fundamental principle, such as no one can deny, and serving as the ultimate foundation (in Logic, the major premise) of deductive inferences; as, for example, 'Things equal to the same thing are equal to one another.' The postulate, in Euclid's sense, is a special accessory to the reasoning, different from the axioms.

But in Philosophy, the postulate takes a much wider sweep, and expresses the most fundamental concessions implied in all reasoning, being prerequisite in order to the establishment of the axioms themselves.

Thus, it is a postulate necessary to reasoning and discussion that a reasoner shall be consistent with himself—that he shall not affirm a thing one minute and deny it the next. The so-called Laws of Thought—Identity, Contradiction, and Excluded Middle—are so many forms of the postulate of consistency. These laws are tantamount to demanding that the same thing shall not be maintained in one form, and denied in another. If we say this room is hot, we must not, at the same time, say that it is not hot. So the ordinary law of the syllogism, 'Whatever is true of all the members of a class, is true of each,' is not so much an axiom as a postulate of consistency; we must be prepared to repeat individually the statements that we have affirmed collectively.

The ultimate premises of all truth and reasoning may be put in the form of postulates, as follows: 1. Present Consciousness must be admitted as a ground of certainty. 'I am thirsty,' 'I hear a sound,' as facts of present consciousness, are to be held as trustworthy in the highest degree, or as amounting to the highest certainty. 2. But present consciousness is not enough; it must further be conceded that Past Consciousness is a ground of certainty. Present consciousness does not amount to an experience of value for future purposes, unless

taken with past. Now, although a remembrance that is long past is often uncertain, a recent remembrance must be pronounced absolutely certain, not less than a present consciousness. That 'I was thirsty a short time ago,' I must be certain of, in order to establish the induction, 'that water quenches thirst.' 3. It must further be conceded, that 'What has been in the past, all circumstances holding the same, will be in the future.' That a thing has been, does not imply that it will be. We may admit that the sun has risen to-day, and rose yesterday, and so on, and without inconsistency, refuse to admit that it will rise to-morrow. People are generally well enough disposed to treat this as a certainty; indeed, there is a strong natural tendency of the mind to expect that the future will resemble the past, which, when corrected and regulated by experience, constitutes our belief in causation and the uniformity of nature. Still, a blind instinct is no guarantee for truth; and as the assertion of the future is a distinct position, it should be formally assumed in a separate postulate. However often a thing may have happened, we still make a leap, and, so to speak, incur a risk in venturing to predict its future recurrence. Our confidence no doubt increases with repetition, but nothing can obliterate the line between what *has been* and what *is to be*.

These three Postulates of Experience, coupled with the Postulate of Consistency, seem adequate as a basis of all the recognised axioms and truths of experience. In other words, the concession of them is enough to commit any one to the reception of all inductive and deductive evidence.

POSTULATION (Lat. 'an asking'), in Canon Law, means a presentation or recommendation addressed to the superior, to whom the right of appointment to any dignity belongs, in favour of one who has not a strict title to the appointment. It is one of the forms of proposing to the pope persons nominated, but not, strictly speaking, elected, to a bishopric. It is also used in the case of elections in which the candidate, although regularly chosen by the electors, yet labours under some legal disability which involves the necessity of a dispensation. The presentation of candidates for the episcopacy, as it exists in the Roman Catholic Church in Ireland, is called postulation.

POSTURES, the name given to the attitude observed in worship, whether private or public, but especially the latter. They are the natural expressions of the feeling which accompanies or characterises the particular devotion in which they are employed, and are used by suppliants to man as well as to God. Four postures are found to have been used by the ancient Christians in their prayer—the standing, the kneeling, the bowing or inclined, and the prostrate. Of these, the ordinary one was kneeling; but for it was substituted, during the Easter-time and on the Sundays, a standing posture, which was understood to symbolise the resurrection of our Lord. To this usage we find allusions as early as the time of Justin the Martyr. In the paintings of the catacombs, and on the ancient enamelled glasses found therein, the standing posture in prayer is accompanied by outstretched and upraised hands. The bowing posture was rather a special act of reverence accompanying a particular address or a particular part of an address, than a sustained posture. It occurred at frequent intervals in the ancient liturgy, and is still used in the Roman mass as well as (even more profusely) in those of all the various rites, Greek, Syrian, Coptic, Armenian, and Russian. The prostrate posture was the attitude of the deepest humiliation,

and was mainly used by the Penitents (q. v.), especially in that grade of public penance which was known under the name 'prostration.' It is also used still in the solemn ordination of subdeacons, deacons, and priests, as performed in the Roman Catholic Church. The question as to the use of particular postures was a subject of much controversy, between the Puritans and the Church of England; and has recently been revived in the Presbyterian Church of Scotland.

POTASH AND PEARL-ASH, in Commerce. See **POTASSIUM**. The chief source of this article is the forests of N. America, where it is derived from the vast quantities of wood cut down and burned in clearing the forest for culture, and also from the branches of the trees felled for timber. The ashes, mixed with a small quantity of quicklime, are put into large wooden cisterns, and covered with water. The whole is well stirred up, and allowed to settle; the next day, the clear liquor is drawn off, and evaporated to dryness in iron pots, whence it is called *potash*. When a sufficient quantity is got to fill a cask of 5 cwt., it is fused at a red heat, and poured into the cask. The mass when cold is coloured gray externally, but when broken, shews a pinkish tint internally. It is very deliquescent, and consequently the casks require to be nearly air-tight. In this state, potash contains a large quantity of foreign materials, amounting to about 40 per cent., amongst which sulphur and carbonaceous matter predominate. This is the crude American potash of commerce. If it is calcined by a reverberatory furnace, the sulphur is driven off, and the carbonaceous matter burned out; the carbonic acid, however, combines with the potash, and forms it into a carbonate. To form it into *pearl-ash*, it is then broken up, and dissolved in water in a wooden cistern, having a perforated bottom, covered with straw, through which it filters, and is afterwards evaporated in flat-bottomed iron pans. As it approaches dryness, it is stirred with iron rods, which break it up into round lumpy masses of a pearly-white colour, and in this state it is the pearl-ash of commerce, and contains about 50 per cent. of pure potassa. An important source of potash is *Carnallite* ($2\text{KCl} \cdot \text{MgCl}_2 \cdot 12\text{H}_2\text{O}$), a deposit above the rock-salt of Stassfurth, Prussia, containing about 27 per cent. of chloride of potassium and 34 per cent. of chloride of magnesium. From the Stassfurth deposit has been very recently introduced into commerce a compound known as *Kainit*, consisting of 30 per cent. of sulphate of potassium, 20 per cent. sulphate of magnesium, 35 per cent. of chlor. sodium, etc. In 1866, 150,000 tons of carnallite were mined at Stassfurth.

POTASSIUM (symb. K, equiv. 39, sp. gr. 0.865) is one of the alkaline metals. The letter K is selected as its symbol, as being the first letter of *Kali*, the Arabic word for potash, the letter P being preoccupied as the symbol for phosphorus. The following are the chief characters of this metal. It is of a bluish-white colour, and presents a strong metallic lustre. At 32°, it is brittle, and has a crystalline fracture; at a somewhat higher temperature, it is malleable; at 60°, it is soft, and of the consistence of wax; at 130°, it is completely liquid; and at a red heat, it becomes converted into a beautiful green vapour. Its affinity for oxygen is so great, that on exposure to the air, it immediately becomes covered with a film of oxide. When heated, it burns with a violet flame. Its intense affinity for oxygen is well shewn by throwing it into water, on which, from its low specific gravity, it floats. The metal abstracts oxygen from the water, and forms oxide of potassium (potash); while the liberated

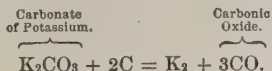

hydrogen carries off a small portion of the volatilised potassium, and taking fire from the heat evolved by the energetic chemical action, burns with a brilliant violet flame. The experiment is a very beautiful one, the burning metal swimming about rapidly on the water, and finally disappearing with an explosion of steam, when the globule of melted potash becomes sufficiently cool to come in contact with the water. At an elevated temperature, this metal removes oxygen from almost all bodies into the constitution of which that element enters; and in the laboratory it is often employed to remove any traces of oxygen from hydrocarbons, by distilling the latter with a small quantity of the metal. From the above facts, it is obvious that potassium must always be kept in some fluid, such as purified rock-oil or naphtha, which contains no oxygen.

Potassium does not occur in the native state, and can only be obtained by the reduction of its oxide, potash. There are three principal modes of reduction, all of which deserve a brief special notice, either on historical grounds or for their practical value.

1. Davy, in 1807, decomposed a fragment of hydrate of potash, by the current of a strong voltaic battery, into potassium, which separated as globules at the negative pole, and oxygen, which was evolved at the positive pole. This mode of procuring potassium yields only very small quantities, and is expensive; but the experiment was a most important one for the progress of chemistry, as shewing for the first time that potash is not, as was previously supposed, a simple body.

2. Stimulated by Davy's discovery, Gay-Lussac and Thenard, in the following year (1808), succeeded in obtaining the metal by purely chemical means in greater abundance, by decomposing potash by means of metallic iron at a white heat. The oxygen of the potash combines with the iron, and the potassium in a gaseous form is condensed in a receiver filled with naphtha, and kept cool.

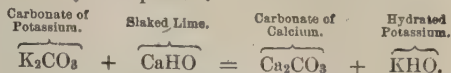

3. The method now usually adopted consists in the distillation of a mixture of carbonate of potassium and charcoal at a white heat, in an iron retort. If proper proportions are taken, the mixture is wholly converted into carbonic oxide and potassium, as is shewn in the equation:

Potassium forms three compounds with oxygen, viz., a protoxide, K_2O , or potash, which is strongly basic, a dioxide, K_2O_2 , and a tetroxide, K_2O_4 , which does not combine with acids, and of which it is unnecessary to say more than that it is a chrome-yellow powder, which is found when the metal is gradually exposed to moderate heat in a current of dry oxygen gas.

Potassium can be procured in the anhydrous form by oxidising thin slices of the metal in air perfectly free from moisture or carbonic acid. It is white, very deliquescent, and caustic. When moistened with water, it becomes incandescent, and the water cannot be expelled by any degree of heat. A far more important substance is the *Hydrate of Potassium* or *Caustic Potash* ($\text{K}_2\text{O} \cdot \text{H}_2\text{O}$, or KHO). This is commonly prepared by dissolving carbonate of potash in ten times its weight of water, and gradually adding to the boiling solution a quantity of slaked lime, equal in weight to half the carbonate of potash used. The resulting compounds are carbonate of lime, which falls as a precipitate, and hydrate of potassium,

which remains in solution; the changes being expressed by the equation:

The clear supernatant fluid is removed by decantation, or by means of a siphon, into a clean silver or iron basin, and is rapidly evaporated till it flows tranquilly like oil; it is then either cast into cylinders in metallic moulds or is poured upon a cold slab, and solidifies on cooling. It may also be obtained in acute rhombohedrons, if allowed to crystallise from a hot concentrated solution; the crystals containing four atoms of water. A solution of hydrate of potassium being one of our most important chemical re-agents, it is very essential that it should be obtained pure. When obtained in the method that has been described, it is apt to be contaminated with carbonic, sulphuric, hydrochloric, and silicic acids, lime, alumina, oxides of iron, &c., any of which substances can be detected by the appropriate tests. Pure caustic potash is, however, perfectly soluble in alcohol, which does not dissolve any of the above-named impurities. Hence, by forming an alcoholic solution of potash, and by evaporating it in a silver vessel till the whole of the alcohol is expelled, we obtain this substance in a state of purity. Hydrated potash, on solidifying after fusion, occurs as a hard, grayish-white, opaque body, with a crystalline fracture, which may be readily again fused into a colourless oily fluid, but which only volatilises at a very high temperature. It is soluble in about half its weight either of water or of alcohol, and rapidly absorbs both carbonic acid and moisture from the atmosphere. It acts as a powerful caustic, and quickly destroys both animal and vegetable tissues, and hence its solutions can only be filtered through pounded glass or sand. Its affinities are so powerful that few vessels are capable of resisting its influence. Its solution must be preserved in glass bottles, into the composition of which no oxide of lead enters, as it has the property of dissolving this oxide out of the glass. Vessels containing silica (porcelain, earthenware, &c.) are decomposed, and platinum itself is oxidised when heated in contact with it. The principal uses of this substance are thus briefly summed up by Professor Miller: "Potash decomposes the fixed oils, and converts them into soluble soaps; when fused with silicious minerals, it displaces the bases, and combines with the silica, forming silicate of potassium. Potash is extensively employed in the arts; to the soap-boiler and the glass-maker, it is indispensable; when combined with nitric acid, it enters largely into the manufacture of gunpowder; and, in greater or less quantity, it furnishes important aids to a variety of processes employed in the manufactures of the country. In the laboratory, potash is in constant use for absorbing acid gases, such as carbonic acid, and for separating the metallic oxides from solutions of their salts, since, owing to the powerful affinity of the alkali for acids, it readily decomposes the salts of all the metals which produce oxides insoluble in water."—*Elements of Chemistry*.

The salts which potassium forms with acids are for the most part readily soluble in water and colourless, unless (as, for example, in permanganate of potassium) the acid is coloured. Most of them are crystallisable, and they all communicate a violet tint, characteristic of potassium, to the flame of spirit of wine and to that of the blowpipe. Many of them occur in the animal and vegetable kingdoms, and the ashes of plants contain them in large quantity. We shall now briefly notice the most

important of these salts. *Carbonate of Potassium* (K_2CO_3) is obtained by burning plants in dry pits, dissolving the ashes in water, evaporating till the sulphates, chlorides, &c. separate in crystals, and then boiling the mother liquid to dryness in iron pots. See POTASH. The quantity of pure carbonate of potassium contained in it is liable to great variation, and the process termed *Alkalimetry* has been invented, with the view of rapidly determining the amount of this salt, on which the commercial value of the pearl-ash depends. Different plants furnish varying quantities of this salt, and the leaves and young shoots are the parts which furnish it most abundantly. The potash is, of course, obtained by the plants from the soil, which, when capable of supporting vegetable life, always contains that substance; and does not exist in the plants in the form of carbonate, but in union with various organic acids (such as acetic, malic, tartaric, and other acids), which, by incineration, become decomposed into carbonates. The purified carbonate of potassium, employed in pharmacy, and for chemical purposes, is prepared from the crude salt by adding an equal quantity of cold water, agitating, and filtering. By this means, all the less soluble foreign bodies are got rid of. The solution is then boiled down to a small bulk, and allowed to cool, when the carbonate separates in small crystals, containing 20 per cent. of water, and represented by the formula $K_2CO_3 + 2H_2O$. Carbonate of potassium is extremely deliquescent, and is soluble in less than its own weight of water, but is insoluble in alcohol. It has an acrid, alkaline taste, and its reaction upon test-paper is strongly alkaline. It is a compound of great importance, both as a chemical re-agent, and as entering largely into the preparation of most of the ether compounds of potash, and into the manufacture of soap and glass. *Bicarbonate of Potassium* ($KHCO_3$) is obtained in white rhombic prisms, by passing a current of carbonic acid gas through a strong solution of carbonate of potassium. These crystals are permanent in the air, but are decomposed by heat; water and carbonic acid being evolved, and the simple carbonate left. This salt is much less soluble than the carbonate, requiring four parts of cold water for its solution, which is nearly neutral to test-paper, and has a much milder taste than the preceding salt. It is employed largely in medicine for making effervescing draughts. *Sulphate of Potassium* (formerly known as *sal poly-chrest*) is obtained by dissolving in water the acid residue of bisulphate of potassium ($KHSO_4$) which is left in the retort in the preparation of nitric acid. This solution, on being neutralised with carbonate of potassium, furnishes hard transparent crystals of this salt. From its extreme hardness, this salt is used in medicine (as, for example, in Dover's Powder), for the purpose of finely comminuting vegetable matters. The *Bisulphate of Potassium*, from which the preceding salt is obtained, is the *sal entium* of the older chemists. Except that it is occasionally employed as a flux, it is of no special importance. *Nitrate of Potassium* has been already described under the head NITRE. *Chlorate of Potassium* ($KClO_3$) occurs in white rhomboidal tablets of a pearly lustre. It has a cooling taste like that of nitre. It fuses at a gentle heat without decomposition, but on increasing the heat, it gradually gives off all its oxygen, and is converted into chloride of potassium, according to the equation:

It is not very soluble, as it requires for its solution 16 parts of cold and 1·7 parts of boiling water. It even exceeds nitrate of potassium as an oxidising

agent; and if combustible substances, such as carbon, sulphur, or phosphorus be heated, or forcibly rubbed with it, a detonation or explosion occurs. This salt is employed in the manufacture of lucifer-matches, in certain operations in calico-printing, and for filling the friction-tubes employed for firing cannon: the best mixture for these tubes consisting of 2 parts of this salt, 2 of sulphide of antimony, and 1 of powdered glass. A mixture known as *White Gunpowder*, consisting of chlorate of potassium, dried ferrocyanide of potassium, and sugar, has been employed for blasting purposes, but its preparation is accompanied by so much danger, that it is seldom used. This salt does not occur as a natural product, but may be obtained by passing a current of chlorine gas through a hot solution of caustic potash; 6 eq. of chlorine combining with 6 eq. of potash to form 5 eq. of chloride of potassium, and 1 eq. of chlorate of potash, according to the equation: $6Cl + 6(KHO) = 5KCl + KClO_3 + 3H_2O$. The two salts are easily separated by crystallisation, as the chlorate is comparatively insoluble, and the chloride extremely soluble. *Hypochlorite of Potassium* ($KClO$) can only be obtained in solution. Under the title of *Eau de Javelle*, it is sold as a bleaching agent. It is obtained by passing chlorine gas through a cold dilute solution of carbonate of potassium, when chloride of potassium and hypochlorite of potassium are formed, from which the chloride may be removed by crystallisation. The *Phosphates of Potassium* formed by the different varieties of phosphoric acid, are sufficiently noticed in the articles PHOSPHATES (in Physiology) and PHOSPHORUS. The *Silicates of Potassium* are important compounds in connection with the manufacture of glass; they also enter into the composition of Fuch's Water-glass, or Soluble Glass, and have been employed by Ransome and others as a coating by which the decay of magnesian and other limestones may be prevented. The *Chromate* and *Bichromate of Potassium* are sufficiently noticed in the article CHROMIUM. The haloid salts of potassium may be passed over very briefly. The *Chloride of Potassium* (KCl) is obtained in large quantity in the preparation of chlorate of potassium, or may be procured by burning potassium in chlorine gas, when the result of the brilliant combustion which takes place is this salt. In its general characters, it closely resembles common salt ($NaCl$), except that the former communicates a violet, and the latter a yellow, tint to the flame of alcohol. It is a constituent of sea-water, of salt-marshes, and of many animal and vegetable fluids and tissues. The *Bromide* and *Iodide of Potassium* are sufficiently noticed in the articles BROMINE and IODINE. *Fluoride of Potassium* (KF) possesses the property of corroding glass. There are no less than five sulphides of potassium, commencing with the protosulphide (K_2S), and terminating with the pentasulphide (K_2S_5). The latter is the main ingredient in the *Hepar sulphuris*, or *Liver of sulphur*, used in medicine. It is a brown substance, obtained by fusing, at a temperature not exceeding 452° , 3 eq. of potash and 12 eq. of sulphur, the resulting compounds being 2 eq. of pentasulphide of potassium ($2K_2S_5$) and 1 eq. of hyposulphite of potash ($K_2S_2H_2O_4$). From this mixture, the pentasulphide may be removed by alcohol, in which it dissolves. The *Yellow* and the *Red Prussiate* (or the *Ferrocyanide* and *Ferridcyanide*) of Potassium are noticed in the articles FERROCYANOGEN and FERRIDCYANOGEN. The *Cyanide of Potassium* (KCy) may be procured by heating potassium in cyanogen gas, when brilliant combustion occurs, and the resulting product is this salt. It may be more cheaply and easily prepared by Liebig's process, which does not, however, yield it pure, but mixed with cyanate of

potash—an impurity which is of no consequence for most of the applications of cyanide of potassium, as, for example, electro-plating and gilding. Eight parts of anhydrous ferrocyanide of potassium are mixed with three parts of dry carbonate of potash; the mixture is thrown into a red-hot earthen crucible, and kept in fusion till carbonic acid gas ceases to be developed, and the fluid portion of the mass becomes colourless. After a few moments' rest, the clear fused salt is decanted from the heavy black sediment, which consists chiefly of metallic iron in a state of minute division. It has recently been derived from an unexpected source. In some of the iron furnaces where raw coal is used for fuel in the hot-blast, a saline-looking substance is sometimes observed to issue in a fused state from the tuyere-holes of the furnace, and to congregate on the outside. Dr Clark of Aberdeen has shewn that this substance is mainly cyanide of potassium. This salt forms colourless deliquescent crystals very soluble in water. It exhales an odour of hydrocyanic acid, and is said to be as poisonous as that acid. Its great deoxidising power at a high temperature renders it a valuable agent in many of the finer operations of metallurgy.

The following are the ordinary tests for the potassium compounds: 1. Solution of tartaric acid added in excess to a moderately strong solution of a potassium salt, gives after some time a white crystalline precipitate of cream of tartar. See TARTARIC ACID. The result is hastened by stirring or shaking. 2. Solution of bichloride of platinum gives a crystalline yellow precipitate, which is a double salt of bichloride of platinum and chloride of potassium. If not previously acid, the mixture to be tested should be acidulated with hydrochloric acid. See PLATINUM. 3. The violet tint occurring in the presence of potassium in the outer flame of the blowpipe, or in the flame of spirit, has been already noticed. 4. The spectrum of a flame containing potassium exhibits a characteristic bright line at the extreme limit of the red, and another one at the opposite violet limit of the spectrum. See SPECTRUM ANALYSIS.

The British Pharmacopœia contains the following preparations of this metal. *Caustic Potash*, or *Hydrate of Potassium* (KHO), which occurs in hard white pencils. From its being fused before being poured into the moulds which give it the form of pencils, it is often termed *Potassa fusa*. From its power of dissolving the animal tissues, it is sometimes used as a caustic, although its great deliquescence renders it somewhat difficult to localise its action to the desired spot. In bites of venomous serpents, mad dogs, &c., it may be applied with advantage, and it is useful in destroying warts and fungoid growths of various kinds. It can be employed with greater safety than the lancet in opening certain abscesses, especially those of the liver. *Solution of Potash*, commonly known as *Liquor potassæ*, is obtained by the process already given for the preparation of hydrate of potassium—namely, by the action of slacked lime on a boiling solution of carbonate of potassium. Its sp. gr. is 1.058, and hence the solution is somewhat weaker than that of the London Pharmacopœia, whose sp. gr. is 1.063, and which, according to the experiments of Mr Phillips, contains 6.7 grains of potash in 100 grains of the solution. 'One fluidounce requires, for neutralisation, 48.25 measures of the volumetric solution of oxalic acid.' *Liquor potassæ*, in combination with a tonic infusion, is of service in cases of dyspepsia which are accompanied with excessive acidity of the stomach, such, for example, as often occur in habitual spirit-drinkers. It is also frequently given with the view of rendering

the urine alkaline, or of diminishing its acidity in cases in which that secretion is too acid. In chronic skin-diseases, especially those of a scaly nature, it often gives relief, if given in full doses, and for a sufficient time; and in chronic bronchitis it is given with advantage for the purpose of diminishing the viscosity of the bronchial mucus. The usual dose is ten drops, gradually increased to as much as a fluidrachm. Infusion of orange-peel and table-beer are fluids which conceal its unpleasant taste. Veal-broth has also been recommended as a medicine in which to present it. In too prolonged use renders the urine alkaline and sedimentary (from the deposit of phosphate of calcium), and tends to impoverish the blood. *Sulphurated Potash*, or *Potassa sulphurata*—which is the new name for the sulphuret of potassium, or liver of sulphur (*Hepar sulphuris*)—is obtained by fusing together carbonate of potassium and sublimed sulphur. It occurs in solid greenish masses, which are liver-brown when recently broken. It is alkaline and acid to the taste, readily forming with water a yellow solution, which has the odour of sulphuretted hydrogen, and evolving that gas freely on the addition of an excess of hydrochloric acid. It is sometimes given internally in doses of three grains (in the form of a pill made with soap), in obstinate skin-diseases, but is chiefly used as a lotion, bath, or ointment for these diseases. It must be recollected that this compound is an energetic narcotico-acrid poison, its action being very like that of sulphuretted hydrogen. *Acetate of Potassium* ($C_2H_3O_2K$) is obtained by the action of acetic acid on carbonate of potassium, and occurs in white foliaceous satiny masses. In its passage through the system it is converted into carbonate, and thus renders the urine alkaline. In small doses, as from a scruple to a drachm, it acts as a diuretic, and is of service in some forms of dropsy. Combined with other potass-salts, it is much given in acute rheumatism. *Carbonate of Potassium* ($K_2CO_3 + 2H_2O$) is employed in medicine in the same cases as those in which solution of potash is used. In large doses, it acts, like caustic potash, as an irritant poison. It is frequently employed in the preparation of effervescing draughts, 20 grains of this salt being neutralised by 17 grains of citric acid, or 18 grains of tartaric acid, or by half a fluidounce of lemon-juice. *Bicarbonate of Potassium* ($KHSO_4$) may be used in the same cases as the carbonate or solution of potash. It is chiefly used for the manufacture of effervescing draughts, 20 grains of the crystallised salt being neutralised by 14 of citric acid, 15 of tartaric acid, and $3\frac{1}{2}$ drachms of lemon-juice. *Chlorate of Potassium* ($KClO_3$) is prescribed with advantage in diseases of a low type, such as scarlatina maligna, cancrum oris, diphtheria, scurvy, &c. As it is eliminated unchanged by the kidneys, its *modus operandi* is unknown. It may be prescribed in doses of from ten to twenty grains three times a day in solution. *Citrate of Potassium* ($C_6H_5K_3O_7 + H_2O$) is obtained by neutralising a solution of citric acid with carbonate of potassium, filtering and evaporating to dryness, when the salt is deposited as a white powder of a saline, feebly acid taste, deliquescent, and very soluble in water. It is procured *extempore* in a state of solution in the effervescing draughts for which we have given prescriptions in our remarks on the carbonates of potassium. It acts mildly on the skin, bowels, and kidneys, whose secretions it promotes, and is an excellent cooling diaphoretic in fevers with a hot and dry skin, being less liable to act on the bowels than the tartrate or acetate of potassium. In irritability of the stomach, it is an excellent remedy, when given as an effervescing

draught. It may be taken in doses of a scruple or half a drachm in solution every few hours. The therapeutic uses of *nitrate of potassium* are noticed in the article NITRE. *Sulphate of potassium* (K_2SO_4) is useful as a mild laxative, a scruple of this salt, especially if combined with ten grains of rhubarb, usually acting mildly and efficiently. It has considerable power in repressing the secretion of milk, and has been much used for this purpose.

The uses of the *tartrates of potassium* are noticed in the article TARTARIC ACID. *Bromide of Potassium* (KBr) occurs in white, transparent, cubical crystals, and is occasionally employed in enlargement of the spleen and in certain forms of epilepsy. The uses of *iodide of potassium* are described in the article IODINE.

POTASH-WATER. See AERATED WATERS.

POTATO (*Solanum tuberosum*; see SOLANUM), one of the most important of cultivated plants, and in universal cultivation in the temperate parts of the globe. It is a perennial, having herbaceous stems, 1–3 feet high, without thorns or prickles; pinnate leaves with two or more pair of leaflets and an odd one, the leaflets entire at the margin; flowers about an inch or an inch and a half in breadth, the wheel-shaped corolla being white or purple, and more or less veined; followed by globular, purplish fruit, of the size of ordinary gooseberries; the roots producing tubers. The herbage has a slightly narcotic smell, although cattle do not refuse to eat a little of it, and the tender tops are used in some countries like spinach. The tubers are, however, the only valuable part of the plant.

The P. is a native of mountainous districts of tropical and subtropical America, probably from Chili to Mexico; but there is difficulty in deciding where it is really indigenous, and where it has spread after being introduced by man. Humboldt doubted if it had ever been found truly wild; but subsequent travellers, of high scientific reputation, express themselves thoroughly satisfied on this point. Except that the tubers are smaller, the wild plant differs little from the cultivated. Maize and the P. are the two greatest gifts which America has given to the rest of the world. The P. has been cultivated in America, and its tubers used for food, from times long anterior to the discovery of America by Europeans. It seems to have been first brought to Europe by the Spaniards, from the neighbourhood of Quito, in the beginning of the 16th c., and spread from Spain into the Netherlands, Burgundy, and Italy, but only to be cultivated in a few gardens as a curiosity, and not for general use as an article of food. It long received throughout almost all European countries the same name with the Batatas (q. v.), or Sweet Potato, which is the plant or tuber meant by English writers down to the middle of the 17th c., in their use of the name potato. It appears to have been brought to Ireland from Virginia by Hawkins, a slave trader, in 1565; and to England by Sir Francis Drake, in 1595, without attracting much notice, till it was a third time imported from America by Sir Walter Raleigh in 1623. It was still a long time before it began to be extensively cultivated. Gerard, in his *Herball*, published in 1597, gives a figure of it under the name of *Batata Virginiana*; but so little were its merits appreciated, that it is not even mentioned in the *Complete Gardener* of London and Wise, published more than a century later, in 1719; whilst another writer of the same time says it is inferior to skirret and radish! It began, however, to be imagined that it might be used with advantage for feeding 'swine or other cattle,' and by and by that it might be useful for poor people, and for

the prevention of famine on failures of the grain-crops. The Royal Society took up this idea, and in 1663, adopted measures for extending the cultivation of the P., in order to the prevention of famines. To this the example of Ireland in some measure led, the P. having already come into cultivation there, to an extent far greater than in any other European country, and with evident advantage to the people. From Ireland, the cultivation of the P. was introduced into Lancashire about the end of the 17th c., soon became general there, and thence spread over England; so that, before the middle of the 18th c., it had become important as a field-crop, which it became in the south of Scotland some 20 or 30 years later; about the same time, in Saxony and some other parts of Germany; but not until the latter part of the century, in some other parts of Germany and in France. In France, the extension of P. culture was very much due to the exertions of Parmentier. In some parts of Germany, the governments took an interest in it, and promoted it by compulsory regulations.

The P. is of great importance as affording food both for human beings and for cattle; and next to the principal cereals, is the most valuable of all plants for human food. It is also used for various purposes in the arts. No food-plant is more widely diffused; it is cultivated in subtropical countries; and struggles for existence in gardens, even within the arctic circle, yielding small and watery tubers; although the effects of late spring frosts, or early autumnal frosts, upon its foliage, often prove that it is a plant properly belonging to a climate milder than that of most parts of Britain. No more important event of its kind has ever taken place than the general introduction of P. culture into the husbandry of Britain and other European countries. It has exercised a most beneficial influence on the general welfare of the people, increasing national wealth, and preventing, as a few far-seeing thinkers had anticipated, the once-frequent returns of famine. That in 1846 and 1847, terrible famine resulted in Ireland and elsewhere from the failure of the P. crop itself, was owing only to the excess to which its cultivation had been carried. The results confirmed two great laws, that plants long very extensively or almost exclusively cultivated in any district, however successfully they may be cultivated for a time, are sure to fail at last; and that the exclusive, or almost exclusive dependence of a people on one source or means of support, is unfavourable to their welfare in respect to all their interests.

Humboldt calculates that the same extent of ground which would produce thirty pounds of wheat, would produce one thousand pounds of potatoes. But potatoes are not nearly so nutritious as wheat, and the constant employment of them as the chief article of food, is not favourable to the development of the physical powers, and is consequently in its protracted influence unfavourable to mental energy. All this is too well illustrated in Ireland and the Highlands of Scotland, in a race capable of the highest development of both. It is calculated that 100 parts of good wheat-flour, or 107 parts of the grain, contain as much actual nutriment as 613 parts of potatoes. The inferiority of the P. in nutritious power is very much owing to the comparatively small quantity of nitrogenous substances which it contains, in consequence of which it is most advantageously used along with some very nitrogenous article of food, in Britain generally with animal food, in some parts of Europe with curds or with cheese. The P. tuber, in a fresh state, contains about 71–80 per cent. of water; 15–20 of starch, 3–7 of fibre or woody matter, 3–4 of gum,

dextrine, and sugar, and 2 of albumen, gluten, and casein. There are considerable differences, however, in different varieties, in different stages of maturity, and in different soils and seasons.

Potatoes are used, both raw and boiled, for the feeding of cattle. For human food, they are variously prepared by roasting or boiling, but now chiefly by boiling, a process by which they are freed from all that is narcotic and noxious in their juice. The water in which potatoes have been boiled is not wholesome, and those modes of preparing them for the table which do not admit of its complete rejection, ought to be avoided.

The herbage or haulm of the P. has been used for making paper, but the results were not encouraging. The berries are sweetish, but not pleasant; nauseous when fermented, but yield by distillation a tolerable spirit.

The varieties of the P. in cultivation are extremely numerous. Any enumeration or classification of them is impossible. New ones are continually appearing, and old ones passing away. Those most advantageously cultivated in particular soils and climates, are often found to degenerate when removed to a small distance. Many of the new varieties of P. are raised near the large cities, and also extensively cultivated in the fields because of their greater earliness and productiveness. The *Early Rose*, a new variety produced in the United States, requires a very short season. Potatoes differ considerably in the character of their herbage—which is sometimes erect, sometimes straggling—and in the size and colour of their flowers; but are more generally distinguished by the colour of their eyes, and the size, form, and colour of their tubers, which are round, long, or white, red, dark purple, &c.

New varieties of P. are produced from seed; but potatoes are ordinarily propagated by planting the tubers, or cuttings of the tubers, each containing an eye or bud. Late crops of early potatoes are sometimes procured by cuttings of the stalks or by layers; methods which might probably be pursued with more advantage where the summer is longer than in Britain. Much has been written by gardeners and agriculturists on the comparative advantages of planting whole tubers or cuttings; but the latter method generally prevails.

Potatoes are planted in drills, made either by the spade or plough; or in *lazy beds*, which are always made by the spade, and are beds in which the sets of potatoes are covered over with earth dug out of the alleys. The alleys serve, although imperfectly, for drains in undrained land. The cultivation of potatoes as a field-crop seems to have been first attempted in lazy beds. They are still common in many parts of Ireland, but are now rare in most parts of England and Scotland. They are very suitable for strong, heavy, and somewhat moist land, and are profitably used in reducing some kinds of soil to cultivation, but are generally unsuitable for field-culture, owing to the expense of labour required. In strong heavy land, potatoes are cultivated in raised drills; in lighter and drier soils, the raising of the drills is unnecessary. Manure is generally given, consisting generally of dung and well-rotted straw from the farm-yard. Guano and other strong artificial manures are apt to produce an excessive growth of stalks and leaves, which is to be guarded against by diminishing or even withholding manure in certain soils; potatoes of too luxuriant growth being always particularly liable to diseases. The cultivation of potatoes, after they are planted, whether in the field or garden, consists chiefly in keeping the ground clear of weeds, and in earthing up the plants, to promote the formation of

tubers. Potatoes are taken up either by the fork or by turning over the drills with the plough, or by a machine constructed expressly for the purpose. In England, garden potatoes are sometimes used before they are really ripe, forming a favourite dish in a very unripe state, when they are far from being a safe article of food, and contribute not a little to the prevalence of cholera and kindred diseases in summer. Field potatoes, unless when intended for the supply of the markets of towns, like garden potatoes, are allowed to ripen thoroughly, and are then capable of being stored for winter and spring use. In Britain, potatoes are forced in hot-beds, and in the spare ground of hothouses, that they may be obtained very early; also, after being thus brought forward in some degree, they are planted out in gardens for a succession of young tubers. The planting of potatoes in the open air cannot be successfully practised in most parts of Britain before February or March, and in many seasons the later-planted are found as early as the earlier-planted, and more productive. The storing of potatoes is variously accomplished in dry, airy cellars, and in *pits*, which are sometimes holes excavated to a small depth in the earth, and the potatoes piled up above the surface of the ground, in a conical, or in a roof-like form, sometimes mere heaps of one or other of these forms upon the surface of the ground, and covered with straw and earth to keep out light and frost. The access of light makes potatoes green, bitter, and unwholesome, as is often seen in those which, whilst growing, have been partially above ground. P. pits are often ventilated by means of pipes, as without ventilation the potatoes are apt to heat and sprout. Potatoes taken from the ground before they are quite ripe are extremely apt to heat and sprout.

The P. crop is now an important one in almost all the rotations practised in Britain, although its cultivation is in most districts not quite so extensive as before its failure from the *P. disease* in 1845 and subsequent years, and farmers are more careful not to depend too much upon it. It very commonly succeeds a grain-crop, but sometimes is advantageously planted on land newly broken up from grass.

The P. is subject to a number of diseases, of which the most important is the *P. Disease* (q. v.) or *P. Murrain*. Before it began to prevail, the chief diseases affecting the P. were those called *Curl*, *Scab*, *Dry Rot*, and *Wet Rot*. Of all these diseases, it would seem that one principal cause, however combined with other causes, is the exhaustion of the vegetative powers of the plant, from frequent propagation by tubers or cuttings of tubers. It is to be borne in mind that propagation by tubers is not properly reproduction, but one plant is divided into a multitude; and the whole analogy of nature seems to shew, that although it may live longer in this way and more healthfully than if left to the spot where its seed first germinated, its existence will come to an end, and the species must be preserved by reproduction from seed. It was long since observed as to *CURL*, the dread of farmers and gardeners before the *P. disease* was known, that it most readily attacks potatoes which sprung from weak sets. *Curl* is a disease affecting the foliage and general health of the P. plant, and does not seem to be necessarily connected with the presence of any vegetable parasite or insect enemy.—*SCAB* is a disease of the tubers, which become covered with brown, oblong, and finally confluent and cup-shaped spots, whilst under the surface is a powdering of minute olive-yellow grains, a fungus called *Tuber cinia Scabiei*, of the division *Hyphomycetes*.—*DEY ROT* is also ascribed to the growth of a fungus of

the same order, *Fusisporium Solani*, and attacks the tubers either when stored for winter or after being planted. It was very carefully investigated by Martius, and described in a memoir published in 1842. It was first observed in Germany in 1830, and caused great loss in that country throughout many years. The tissues of the P. tuber become hardened and completely filled with the mycelium of the fungus, which at last bursts forth in little cushion-shaped tufts loaded with fructification.—Wet Rot differs from Dry Rot in the tubers becoming soft and rotten instead of hard and dry, and is always characterised by the presence of a fungus referred by Fries to his genus *Periola*, but which Berkeley regards as another form or stage of the same fungus which causes or is inseparably connected with Dry Rot. Both Dry Rot and Wet Rot have often been observed along with the P. disease, which, however, is always characterised by the presence of another peculiar fungus.

Starch is made from the P., from which it is very easily separated, and is in large proportions. It is manufactured on a very large scale both in America and in Europe. It is chiefly used in textile manufactures after its conversion into dextrine or British gum. See STARCH. In Holland and in Russia, large quantities of starch are made and converted into sugar or syrup. See SUGAR. The refuse of the starch-manufactories is used for pig-feeding or for manure. In the north of Europe, much spirit for drinking is made from potatoes; it is called Potato Brandy.

POTATO-BUG, a beetle of the genus *Doryphora* (Fam. Chrysomelidae, group Tetramera), very destructive to the potato crop in the United States, feeding on the leaves of the plant. It is a native of the northern Mississippi region, but has migrated eastward. Curculios of the *G. Baridius* bore the stems of potatoes.

POTATO DISEASE, or POTATO MURRAIN.

No subject connected with Agriculture or with Botany has given rise within so short a time to so extensive a literature as this. It has been treated in books and pamphlets, and in magazines and periodicals of every kind. The terrible famines caused by the failure of the potato crop in Ireland and other countries, particularly in 1846 and 1847, concentrated upon it the attention of the whole civilised world; and yet it remains very obscure.

The potato disease seems to have been at first confounded with Dry Rot and Wet Rot (see POTATO), which appeared a number of years before it to a formidable extent, although not to be compared with it in their ravages. This fact—and all the more if the potato disease is to be ascribed to the presence of a different and peculiar fungus—may perhaps be held as giving support to the opinion that its chief cause was really the weakening of the plant through too constant cultivation on the same land, and continued propagation by tubers alone.

The potato disease was first observed in Germany, and first assumed a very serious character near Liège in 1842. In 1844 it broke out in Canada, and all at once proved very destructive. In 1845, it was first noticed in England, and first in the Isle of Wight. But during that year, its ravages were considerable in the British Islands; much more so in the year following, when the Irish famine was the consequence, and in the same year it prevailed very extensively over almost all parts of Europe. The summer was unusually cloudy and moist, a circumstance probably not without its effect. In 1847, the disease was still prevalent, but to a smaller extent; and since that time its prevalence has gradually diminished, although it occasionally breaks out in particular localities. Meanwhile, it is to

be observed, that almost all the varieties of potato cultivated to any considerable extent before 1846, have disappeared, and been replaced by others. Lest too much, however, should be inferred from this in favour of a particular theory, it must also be stated, that potatoes newly raised from seed were sometimes severely attacked by the disease during the period of its greatest prevalence.

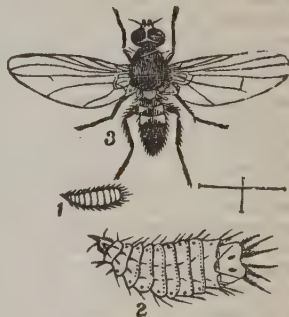

No fully satisfactory theory as to its cause or origin has been proposed. That it has long existed in the western parts of America, may probably be true, as has been alleged, although the distinction between it and other diseases of the potato might not perhaps be noted with sufficient care; but even this would not account for its sudden appearance and terrible devastations in other parts of the world. Many observers ascribed it to insects and *acari*, some even to infusoria in the tissues, but the presence of none of these was found to be constant, and they appeared therefore rather to be the consequences than the cause of the disease. It is otherwise with the fungus, *Botrytis infestans* (see BOTRYTIS), which is always present, although probably, like other parasites, it generally attacks an already weakened plant. The disease generally first appears in the leaves, and thence extends to the tubers, although it has been sometimes observed to appear in the tubers of some of the early kinds of which the leaves have perished before the season when it breaks out. It sometimes also lies dormant in the tubers for months, so that after being stored apparently sound in autumn, they become diseased in the following spring. When the disease appears in the growing plant, brown spots are first to be noticed on the margins of the leaves, corrugating the leaves as they spread. Very rapid extension of the disease, and decay of the leaves and stalks, often ensue. It is on the under surface of the leaf that the *Botrytis* is found; it abounds also in the diseased tubers, which, when cut, produce an abundant crop of it from the fresh surface, and it sometimes vegetates even from the natural surface. The same fungus has been found in the berries of the Tomato (q. v.) when diseased, and on the leaves of other plants of the natural order *Solanaceæ*, but never on any plant not of that order.

The starch granules which exist within the cells of potatoes seem not to be affected by the potato disease, but remain unaltered in quality, so that as good potato starch is made from unsound as from sound tubers. On occasion of the great ravages of the disease in 1846, however, advantage was but partially taken of this fact, partly from ignorance of it; partly from an apprehension, apparently quite unfounded, that the starch might prove unwholesome; and partly from the want of machinery to grate down the diseased potatoes before rottenness had involved the whole.

POTATO-FLY

(*Anthomyia tuberosa*), a dipterous insect of the same genus with the Beet-fly, Cabbage-fly, Turnip-fly, &c. In its perfect

state, it is very like the House-fly. The male is about five lines long, grayish-black, bristly, with

Potato-fly:

- 1, Larva or maggot, natural size;
- 2, larva magnified; 3, Potato-fly.

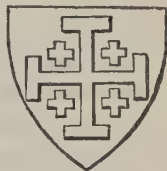

five indistinct broad stripes on the back, and four ochreous spots on the second and third segments; the female ashy-slate colour, with two indistinct ochreous spots on the second abdominal segment. The maggots are very abundant in bad potatoes in autumn, and are very different from the maggots of the House-fly, being horny, spiny, bristly, and tawny; the long tail ending in six long bristles. The pupa is very like the larva.

POTCHINKY, a district town of European Russia, in the government of Nijni-Novgorod, 110 miles south-south-east of the city of that name, and 800 miles south-east from St Petersburg. It is one of the centres of the corn-trade of the country, and exports potash. Pop. 7554.

POTEMKIN,* **GREGORY ALEXANDROVITCH**, the most celebrated of the Czarina Catharine II.'s favourites, was born near Smolensk in September 1736. He was descended of a noble Polish family, and at an early age entered the Russian army, and rose to be ensign in the imperial horse-guards. Happening to attract the notice of the czarina by his noble appearance and handsome athletic figure, he was forthwith (1762) attached to her household, and appointed colonel and gentleman of the bed-chamber. After a time (1774), he superseded Gregory Orlov (q. v.) in the good graces of the czarina, and became her favourite and avowed lover. He played the part of lover for only two years, when he was superseded by a younger and more amiable successor; but the ascendancy which he had acquired over the czarina was in nowise affected by this change. He knew well how to flatter her vanity, rouse her fears, and make her believe that he alone could protect her from the numerous conspiracies (some of which were real, and many mythical) which were being constantly formed against her. Catharine submitted to all his caprices, consulted him in everything, and was in almost all cases guided by his advice. P. was consequently, from 1770 till the year of his death, the true representative of the Russian policy in Europe; and Frederick the Great of Prussia, and even the haughty Hapsburgs, Maria Theresa and Joseph II., cringed at his feet, and, at the demand of the czarina, loaded him with titles and honours; though, much to his chagrin, he failed to obtain the English order of the Garter, and the French one of the Holy Spirit. P. interfered little with the internal government of Russia, beyond offering many valuable suggestions for the development of manufactures and industry, which were carried out; his important achievements being connected with the foreign policy of Russia, especially as far as it related to Turkey. It was at his instigation that the Turks were forced into war, and robbed of their territories north and east of the Black Sea, in order that Russia might possess a southern sea-board; and after this had been done, P. immediately ordered the creation of a Black Sea fleet, and the building of Kherson, Kertch, Nikolaiev, and Sebastopol. For his services he was created governor of the Taurida (q. v.), and loaded with numerous honours and presents. In 1787, Catharine paid a visit to him at his government, and the 'hoax' which he played off on his sovereign is well described by De Segur. He caused an immense number of wooden painted houses to be constructed, and grouped into towns and villages along the route the czarina was to take, and hired people to act the part of villagers, merchants, tradesmen, and agriculturists, engaged in their various pursuits. The czarina's vanity was hugely gratified at the seeming

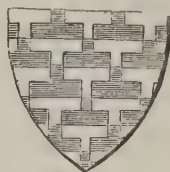

improvements of the country under her rule, and P. was rewarded for his dexterity by further honours and emoluments. Almost immediately after this, a war broke out with the Turks, and P. was placed at the head of the army, with Suwarof and Repnin for his lieutenants. His career was one of uninterrupted victory. Bessarabia and the two principalities were conquered, and he was about to advance on Constantinople, when the empress commanded a cessation of hostilities; but before P. had time to bring her round to his own views, he was seized with sudden illness on the road between Jassy and Nikolaiev, and died there, October 15, 1791.

POT'ENT, Cross, in Heraldry, a cross crutch-shaped at each extremity. It is also called a Jerusalem cross, from its occurrence in the insignia of the Christian kingdom of Jerusalem, which are, Argent a cross potent between four crosslets or. This coat is remarkable as being a departure from the usual heraldic rule which prohibits the placing of metal upon metal.

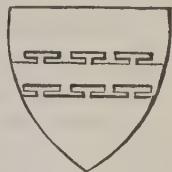

Potent.

POTENT COUNTER-POTENT, one of the heraldic furs, in which the field is filled with crutch-shaped figures alternately of metal and colour, those of opposite tinctures being placed base against base, and point against point. The metal and colour are understood to be argent and azure, unless they be specially blazoned otherwise. Potent counter-potent is sometimes blazoned Vairy-cuppy.

Potent Counter-Potent.

POTENTÉE, a heraldic line of division which takes the form of the outline of a succession of crutch-shaped figures.

Potentée

POTENTILLA, a genus of plants of the natural order *Rosaceæ*, suborder *Potentilleæ*, differing from *Fragaria* (Strawberry) in the fruit having a dry instead of a succulent receptacle. The species are very numerous, natives chiefly of northern temperate regions, and some of them of the coldest north; most of them perennial herbaceous plants, with yellow, white, red, or purple flowers, and pinnate, digitate, or ternate leaves. They are often called CINQUEFOIL (Fr. five-leaved); and some of the species are favourite garden flowers. A few are natives of Britain; one of the rarest of which is a shrubby species (*P. fruticosa*), forming a large bush, with pinnate leaves, and a profusion of yellow flowers, often planted in shrubberies. *P. reptans*, a common British species, with creeping stems, digitate leaves, and yellow flowers, once had a high reputation as a remedy for diarrhoea, from the astringent property of its root, of which most of the species partake with it. But *P. anserina*, a very common British species, popularly known as SILVERWEED, having creeping stems, yellow flowers, and pinnate leaves, which are beautifully silky and silvery beneath, has an edible root, with a taste somewhat like that of the parsnip. Swine grub it up with avidity, and it was once much esteemed as an article of food in some parts of Scotland, particularly in the Hebrides.

* The name is pronounced *Patiumkine* by Russians.

where it abounds and has been a resource in times of famine. The varieties common in the northern U. States are *P. Canadensis*, *Pennsylvanica*, *argutea*, *paradoxa*, and *tridentata*, together with several others introduced from Europe, among which are *R. flammula*, *sceleratus*, *repens*, *reptans*, *bulbosus*, *aeris*, &c.

POTE'NZIA (anc. *Potentia*), the chief town of the province of P., or BASILICATA (q. v.), Italy, is situated on a hill of the Apennines, near the river Vaseuto or Basento, 54 miles east of Salerno. Pop. 15,450. It is surrounded by a wall, has a fine cathedral of the Doric order, and is the seat of an archbishop. P. was shaken by earthquakes in 1273, 1694, and 1812. The province of Basilicata is that which suffers most from brigandage, because of the hills and woods which surround it.

POT-HERBS are not, as might be supposed from the name, the vegetables chiefly used for culinary purposes as supplying articles of food, but rather those which are of secondary importance, and valuable chiefly for flavouring, as parsley, fennel, &c.

POT-METAL is an alloy of lead and copper, obtained by throwing lumps of copper into red-hot melted lead. It is of a gray colour, brittle and granular.

POTO'MAC, a river of the United States, formed by two branches, which rise in the Alleghany Mountains, and unite 20 miles south-east of Cumberland, Maryland, from which point the river flows in a generally south-easterly course, 400 miles, and falls into Chesapeake Bay, where it is 6 to 8 miles broad, 75 miles from the ocean. Line-of-battle ships ascend to Washington, 120 miles from its mouth, and the tide reaches Georgetown. Between Westport and Washington, 220 miles, it falls 1160 feet. The scenery in this portion of its course is wild and beautiful, especially where it breaks through the Blue Ridge at Harper's Ferry. Its principal affluents are the Shenandoah, Savage, Monocacy, and Acquia Creek. The P. forms the greater part of the boundary between Virginia and Maryland. During the war which began in 1861, both Federal and Confederate armies crossed several times the fords of the Upper Potomac, and severe actions were fought upon its banks.

POT'OROO, or KANGAROO RAT (*Hypsiprinus*), a genus of marsupial quadrupeds, of the family *Macropidae* (see KANGAROO), differing from kangaroos chiefly in having distinct canine teeth in the upper jaw. The first pair of incisors in the upper jaw are also longer and larger than the others. The molars decrease in size backwards; and when not worn, present four blunt tubercles. The forelimbs are proportionally longer, the hinder-limbs less powerful than in the kangaroos. The general form and habits are similar; there is the same sitting on the hind-feet with help of the tail for support, and a somewhat similar hopping, but not nearly an equal power of vigorous leaping. The stomach is large, and divided into two sacs, with several inflations; the food entirely vegetable. There are several species, all of small size, none of them larger than a rabbit, and all natives of Australia, timid and harmless creatures. They are generally clothed with a dense, and sometimes a beautiful fur; but the tail is nearly destitute of hairs, and scaly.

POTO'SI, one of the richest mining-towns of South America, the fourth town of Bolivia, and capital of a department of the same name, stands in a dreary and barren district, 13,330 feet above sea-level, in lat. 19° 35' S., and long. 65° 25' W., 70 miles south-west of Chuquisaca. It covers a large area, and in 1611, its population was 170,000, but

in 1858, it had fallen to 22,850, and great part of the town was in ruins. In its centre is a large square, around which are ranged the principal public edifices, as the government-house, town-house, cathedral, &c. The mint is a large building, in which the average amount now coined amounts to about 2,000,000 dollars annually. In the central square, an obelisk in honour of Bolivar was erected in 1825. English and French manufactures are imported; and as the country in the vicinity produces little or nothing, all supplies have to be brought from a distance. The Cerro (sierra) de Potosi, or Silver Mountain, is 15,200 feet high. Its summit is honey-combed with upwards of 5000 mines, and operations are now carried on at a lower level, where the inrush of water, however, often compels the miners to abandon the richest mines. Up to the year 1846, the quantity of silver extracted from the mines of this mountain amounted to £330,544,311.—Bollaert's *Antiquities of South America*.

POT-POURRI, in French, the name of a mixture of sweet scented materials, chiefly flowers, dried, and usually placed in a vase with a perforated lid, in order that their perfume may be diffused through rooms in which it is placed. The principal ingredients are rose-petals, lavender flowers and stalks, violets, jessamine flowers, woodruff leaves, cloves, orris-root, pimento, musk, sandal-wood raspings, cedar-shavings, &c. But it also signifies a dish of different sorts of viands, and corresponds, in this sense, to the *hotch-potch* of Scotland, and the *Olla Podrida* (q. v.) of Spain.

POT-POURRI, in Music, a selection of favourite pieces strung together without much arrangement, so as to form a sort of medley.

POTSDAM, the capital of the Prussian province of Brandenburg, and, next to Berlin, the handsomest and best built town in Prussia, is situated on an island at the point of junction between the small stream of the Nuthe and the river Havel, 16 miles south-west of Berlin. Population at the close of 1871, 43,784, in 1880, 48,346. P. is divided into the Old and New Town, and is surrounded by ramparts with nine gates, from which seven bridges over the Havel and the canal lead to the suburbs. The streets are broad and regularly built, and there are fine squares, some of which are planted with trees, forming pleasant public walks. Of the many large and handsome buildings, one of the most worthy of notice is the old royal palace, an oblong parallelogram, three stories high, with a magnificent colonnade facing the fine Havel Bridge. P. has several benevolent and educational institutions connected with the state, as, for instance, two asylums for the orphan children of military men, and one for those of persons belonging to the civil service; schools for cadets, subalterns, and privates; the Luisendenkmal, an institution for providing for indigent girls of irreproachable character; a gymnasium, a high school, and various other training and special schools. Among the churches, the most noteworthy are the Garnisonskirche, with a tower 400 feet high, a fine chime of bells, and a noble marble pulpit, below which rest the remains of Friedrich-Wilhelm I. and Friedrich II., and St. Nicolai's, lately rebuilt after the model of the Pantheon at Paris. The Brandenburger-Thor, which is the handsomest of the various gates, is a triumphal arch copied from Trajan's Arch at Rome; and this, like the other gates, opens upon a fine allée of trees. P. is surrounded with pleasant public walks and gardens, wooded heights, and vine-covered banks; while in the immediate neighbourhood are numerous

royal country palaces, as Sans-Souci, the favourite residence of Frederick the Great, surrounded by a fine park, pleasure-grounds, and choicely-stocked gardens, near which stands the Ruinenberg, with artificially constructed ruins, designed to conceal the water-works which supply the fountains of the palace. Near the park is the New Palace, begun in 1763, 680 feet in length, containing nearly 100 rooms, many of which are filled with costly works of art. Near Sans-Souci is Charlottenhof, built by the late king, a pleasant villa, with lovely gardens, in which stands a Pompeian house. The Russian colony of Alexandrowska, with its Russian houses and Greek church, lies near the Pfingstberg, which is surmounted with an unfinished palace, from whence a fine view is obtained of the numerous royal parks and gardens, and the surrounding country. In the New Garden stands the Marble Palace, with arcades adorned with frescoes of the *Nibelungen Lied*.

P. is the seat of the provincial government, and of several of the state manufactories. Of these, the most important is the manufactory of arms, at which the rifles for the army are finished with all the newest applications of science, and made ready for use. A railway, 16 miles in length, connects P. with Berlin.

P. owes its creation as a town to the great elector, Friedrich-Wilhelm, who built a royal palace here between 1660 and 1673, and laid out several good streets. Prior to that period, it was an insignificant fishing village, built on the site of an ancient Wendish settlement.

POTSDAM, a township and village in New York, U.S., on Racket River, St Lawrence County, in the northern portion of the state, between Lakes Ontario and Champlain. There are quarries of sandstone, mills and factories on the falls of the river, a railway connecting it with Watertown, a bank, and 10 churches. Pop. of village (1880), 2762.

POTSTONE, *Lapis Ollaris* of the ancient Romans, a variety of Talc (q. v.), or rather a mineral formed by a mixture of talc with chlorite, &c. It is generally of a grayish-green colour, sometimes dark green. It occurs massive, or in granular concretions. It is soft and easily cut when newly dug up; greasy to the touch, and infusible even before the blowpipe. It becomes hard after exposure to the air. It is made into pots and other household utensils, which communicate no bad taste to anything contained in them, and when greasy are cleaned by the fire. It was well-known to the ancients; and Pliny describes the manner of making vessels of it. It was anciently procured in abundance in the isle of Siphnos (now Siphanto), one of the Cyclades, and in Upper Egypt. Large quarries of it were wrought on the Lake of Como, from about the beginning of the Christian era, to 25th August 1618, when they fell in, causing the destruction of the neighbouring town of Pleurs, in which it was wrought into culinary vessels, slabs for ovens, &c. It is quarried in the Valais, where it is called *Giltstein*; in Norway, Sweden, Greenland, and near Hudson's Bay, &c. 'Should you again visit Italy, and pass by the Great St Bernard, if the cold of that frigid region should induce you to warm yourself in the refectory of the hospitable monks of the convent, you will there see a stove of potstone.'—*Jackson on Minerals and their Uses*.

POTT, AUG. FRIEDR., a distinguished philologist, was born at Netzdreide in 1802, attended school at Hanover, studied theology and philology at Göttingen (1821), and finally (1833) became professor of the science of language in the university of Halle. Next to W. Humboldt, Bopp, and Grimm,

the name of P. stands prominent in the new science of comparative philology. The foundation of his reputation was laid by his *Etymologische Forschungen* (Etymological Researches, 2 vols., Lemgo, 1833—1836), a work second in importance only to Bopp's *Comparative Grammar*. In a well-known article in Ersch and Gruber's *Encyclopædia, Indogermanischer Sprachstamm* (2d sect. vol. 18), he gave a masterly sketch of the Aryan Languages (q. v.). In numerous articles in periodicals, and in separately published treatises (e. g., *De Borussia-Lithuanica tam in Slavicis quam in Letticis Linguis Principatu*, Halle, 1837—1841; and *Die Zigeuner in Europa und Asien*, 2 vols. Halle, 1844—1845), he carried his researches into special fields of this great province. *Die Quinare und Vigesimal Zähl-methode* (The Quinary and Vigesimal Notation, Halle, 1847), and *Die Personennamen* (Proper Names, Leip. 1853), are admirable treatises, containing an overwhelming mass of information, and shewing an astonishing knowledge, not only of the Aryan languages, but of other Asiatic, African, and American races. He has since published a work on the *Difference of Races from a Philological Point of View* (Lemgo, 1856).

POTTER, JOHN, D.D., an English scholar and divine, the son of a linen-draper of Wakefield, in Yorkshire, was born in 1674, studied with great diligence and success at Oxford, where he took his degree of M.A. in 1694, and in the same year went into orders. He was appointed chaplain to Queen Anne in 1706, professor of divinity at Oxford in 1708, bishop of Oxford in 1715, and finally in 1737 attained the highest dignity in the English Church—the archbishopric of Canterbury. He died Oct. 21, 1747, and was buried at Croydon. P. was really a superior scholar, but of the dull and plodding sort. Nowhere does he flash a ray of clear searching intelligence on his subject; his habit of mind is quite uncritical, and consequently his learned labours, though creditable to his industry, have added nothing to our knowledge, and have now 'followed' their mediocre author into something very like oblivion. P.'s principal work is his *Archæologia Græca* ('Antiquities of Greece,' 2 vols. 1698), superseded for many years by Dr W. Smith's *Dictionary of Greek and Roman Antiquities*; besides which, however, we may mention his edition of *Lycophron* (1697), and of *Clemens Alexandrinus* (1715). As a church dignitary, the linen-draper's son is said to have been haughty; he was likewise very 'zealous' in matters ecclesiastical, a vigilant guardian of clerical interests, and strictly, perhaps we may even say excessively, orthodox, if such a thing be possible!

POTTER, PAUL, one of the most distinguished masters of the Dutch School. He was born at Enkhuyzen in 1625, and was the pupil of his father, Pieter Potter, an obscure painter. His progress was so rapid, that by the time he had attained the age of 15, his reputation as an artist was high. He left Amsterdam, and established himself at the Hague, where, in 1650, he was married; in 1652, however, he returned to Amsterdam, at the solicitation of the burgomaster Tulp, who commissioned him to paint a great number of works; but his health, which was delicate, gave way under constant application at his easel, and he died before he had completed his 29th year. Paul P.'s cattle-pieces are perhaps more highly valued than pictures of that class by any other master, for none have combined and brought out with such admirable technical skill so many of the qualities that give a charm to such works. His pictures bring immense prices, particularly those

painted between 1652 and 1654, when he died. He executed some admirable etchings.

POTTER'S CLAY or FIGULINE, a kind of Clay (q. v.); either slaty and massive, or more generally, earthy; yellow, yellowish-white, gray, or sometimes greenish; adhering strongly to the tongue, and forming a paste with water. The earthy variety is sometimes very loose, sometimes almost solid. P. C. is a mineral of very common occurrence in alluvial districts, and sometimes occurs in beds of considerable thickness. It occurs in many parts of Britain. It is used in potteries for the manufacture of earthenware; the different varieties of it being adapted to different kinds of earthenware. Houses are built in Egypt of pots of this material.—P. C. is also employed in agriculture for the improvement of light sandy and calcareous soils.

POTTERY. This term—supposed to be derived from *poterion*, the drinking-cup of the Greeks, and transmitted by the French word *poterie*—is applied to all objects of baked clay. The invention of pottery dates from the most remote period, and its application is almost universal—objects of pottery being in use amongst races even semi-barbarous. The art of moulding or fashioning vessels of moist clay, and subsequently drying them in the sun, is so obvious, that it is not above the intelligence of the rudest savage. Hence, at the most remote antiquity, the Egyptians, to whom precedence must be assigned in this art, made bricks of unbaked or sun-dried clay, cemented with straw, which were quite sufficient for the purposes of construction in a country where little or no rain falls. These bricks, in shape resembling those in use at the present day, but of larger dimensions, were impressed, at the

Fig. 1.—Unglazed Egyptian Bottle in the British Museum.

earliest period, with the marks of the brick-maker, and later, with the names and titles of the kings for whose constructions they were made. The oppression of the Hebrews chiefly consisted in compelling them to work in the brick-fields—a task imposed on captives taken in war and reduced to slavery; and the fortresses of Pithom and Rameses, on the Egyptian frontiers, were made of bricks by the Hebrews. Kiln-dried bricks, in fact, did not come into use in Egypt till the Roman dominion, although some exceptional objects of the class of bricks have been found, such as a kind of conical plug, stamped on the base with the names of the tenants of

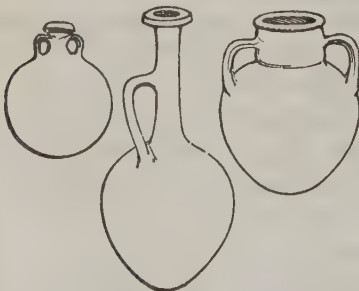

Fig. 2.—Glazed Egyptian Vases in the British Museum.

the tombs. A few other objects were made in unbaked clay; but vases of baked earthenware were in use at the earliest period of Egyptian civilisation, and are contemporary with the

Pyramids themselves. The Egyptians made a red ware, a pale-red or yellow ware, and a lustrous or polished red ware—the two first being used for vases destined for culinary and other purposes, the last for vases of more refined use, such as holding perfumes, wine, honey, and other delicacies. But the most remarkable Egyptian pottery was the so-called porcelain, made of a fine sand or frit loosely fused together, and covered with a thick silicious glaze of a blue, green, white, purple, or yellow colour. This celebrated ware, the porcelain of the old world, sometimes exhibits the most beautiful tints of blue, a colour which was produced by an oxide of copper, and which is still unrivalled. Objects were made of this material for the decoration of the dead and for the toilet. They were exported from Egypt to the neighbouring countries, and are found alike in the tombs of the Greek isles, the sepulchres of Etruria, and the graves of Greece. Most of the figures of deities, the sepulchral ones deposited with the dead, a few elegant vases, portions of inlaying, objects of the toilet, and beads and other decorations, are made of this porcelain. Still finer work of this kind was produced by carving scarabæi and other small objects in steatite, and covering them with a blue glaze, so as to combine brilliancy of colour with delicacy of execution. The Egyptians had at the earliest period the simpler manipulations and tools of pottery—the potter's lathe or wheel, moulds for stamping objects, and various other tools. On the decadence of the country under the Greeks and Romans, the pottery became assimilated to the Greek and Roman.

In the contemporary empires of Assyria and Babylon, pottery was also in use at an early period. Sun-dried and kiln-dried bricks were made in the reigns of Uruk and other monarchs of the oldest Babylonian dynasties, about 2000 B.C. Platforms for elevating the larger edifices were made of them; and the bricks, like the Egyptian, were stamped with the names and titles of the monarch, to which was added the locality for which they were destined. Glazed bricks of various colours, occasionally enriched with scenes and ornamental designs, were introduced into constructions; and Semiramis is said to have adorned with them the walls of Babylon. The Assyrians and Babylonians employed this material for historical and legal purposes, making cylinders, hexagonal prisms, and purse-shaped objects of it, on which were impressed extensive writings. One of these remarkable objects contains the account of the campaign of Sennacherib against Judea and the tributaries of Hezekiah. The Assyrian and Babylonian pottery resembles, but is not entirely the same as the Egyptian, being of a pale red ware, of thinner substance, finer paste, and more refined shape. At a later period, figures of deities were modelled in terra cotta. The glazed ware of Babylon and Assyria is coarser than the finest Egyptian, and is the earliest example of the employment of materials for colouring like those now in use; the glaze, however, is silicious. The objects most remarkable for size are the large coffins found at Warka, supposed by some to be the Ur of the Chaldees, with oval covers, and ornaments of the Sassanian period. The potteries of Mesopotamia continued to flourish under the Parthian and Sassanian monarchs till the conquest of Asia by the Mohammedans.

The potter's art is mentioned in the Scriptures, but few specimens of Hebrew wares have been found. Some vases have been exhumed in Phœnicia. The most remarkable pottery of antiquity was the Greek, which seems to have had another origin than the oriental. The terms *keramos* and *ostrakon* were applied by them to this material, and

they made objects and vases in sun-dried clay, terra cotta, and glazed ware. The use of bricks was by no means extensive in Greece, although some public edifices were made of them. Their first use is attributed to Hyperbius of Crete, and Euryalus or Agrolas. The bricks were made by a mould (*plasion*) and were called after the numbers of palms-length. Some were so light that they floated on water. Besides bricks, tiles, cornices, artificial ornaments, friezes, pipes for conducting water, and drains, were moulded in terra cotta. Statues and small figures, *pelinoi*, gaily and appropriately painted, covered with a *leucoma*, or white ground, and occasionally partly gilded, were in common use for votive and other purposes, and sold at a cheap price by the figurist (*koroplasthos*). Dolls, cones, and various smaller objects were made by the potters; they were sometimes modelled, but more generally moulded. The Greeks claimed the invention of the potter's wheel; and the principal cities contested the honour of the art, which is mentioned in Homer, and attributed to Corœbus of Athens, Hyerbius of Corinth, or Talos, the nephew of Dædalus. Numerous vases for all the ordinary purposes of life were made by it, and others

archaic Greek art, were introduced, with accompanying inscriptions, which cannot be later than the 6th or 5th c. B. C. The subjects of these vases were derived from the oldest Greek myths. The style of this pottery by degrees improved: the paste became pale red or salmon colour; the human figures, which had been at first subordinate, replaced the friezes of animal and large ornaments. As the improvement went on, the backgrounds were made of a bright orange-red colour, the figures of a deep black; while portions, as the hair, garments, and flesh of female figures, were coloured white. The style of art became much freer, although still retaining the rigidity of the *Ægean* school. Names of figures represented, of the artists who painted and the potters who made the wares, were added, with speeches, and the names of celebrated beauties and athletes of the day. In these styles, the vases made on the wheel appear, while yet soft, to have had the subjects traced upon them with a finely-pointed tool; the figures were then filled in with a lucid black pigment of manganese, and then returned to the furnace. The details of the muscles and other portions were incised through the black with a sharp tool, so as to shew the lighter background, and the purples, crimsons, blues, and other colours were laid on. The subjects are chiefly derived from the war of Troy and the heroic age; and the shapes in use were oil-jars (*lecythoi*), water-pails (*hydrie*), wine-vases (*crateres*), wine-jugs (*anochoæ*), and *amphoræ*. They seem to have continued in use till about 450 or 420 B. C., when the red figures were substituted for black, by tracing, as before, the figures on the clay, then running round them a thick line of flock, and finally filling up the background entirely with black colour—the muscles and inner marking not being incised, but traced in black and brown outlines. The earlier vases of this class, which are of the strong style, resemble those of the black figures; but the style gradually improved, and resembled the art of Phidias and Zeuxis; while the letters are those in use after the archonship of Euclid, 403 B. C. The style and form of these vases altered according to the art of the period, till the ultimate disuse of fictile or painted ware, about 300 B. C., when the conquests of Alexander the Great and the increase of luxury caused it to be superseded by vases in metals. In its last

Fig. 3.—Greek Vases of various styles.
From the British Museum.

of large form, decorated also by separate ornaments, *emblemata*, attached to them. Large casks or *pithoi* were modelled on a framework of wood. Great quantities of amphoræ, manufactured on the wheel, and used to contain the choice wines of Greece, were exported from Rhodes and other cities; and their débris are found in the Crimea, Alexandria, Sicily, and other cities. Some of the earlier specimens of a glazed earthenware were painted with colours in fresco or encaustic, from which afterwards came the more elaborate pictures of the glazed vases of Greece. To these succeeded two or three classes of painted ware, consisting of rude representations of animals laid upon the pale red ground of the clay in brown outline, a style prevalent at Athens and Asia Minor; which was followed by the potteries of Corinth, or the so-called Phœnician or Egyptian style. The paste of the vases is of a light red or yellow, the figures in a black or maroon colour, with portions enriched with crimson or purple; the backgrounds of a pale straw or lemon colour; the animals, of a larger size than those of the Athenian vases, intermingled with chimæras and other monsters; the backgrounds variegated with flowers—the whole derived from oriental art. Gradually, human figures, with all the characteristics of

Fig. 4.—Greek Vases of later style, found in Italy.

stage, the pottery became moulded, and was glazed entirely black, or else variegated with opaque white figures and ornaments. The subjects of these later vases differ considerably from the earlier, being chiefly derived from the theatre or myths of the

later poets. Vases of this description are found in Greece, the isles of the Archipelago, and Italy; into which latter country they appear to have been imported from Greece.

In Italy, indeed, the Etruscans, at an early period, and perhaps some of the principal cities in Magna Græcia, manufactured their own pottery. That of the Etruscans consists principally of three kinds—an unglazed red ware; a lustrous brown ware, made also by the neighbouring Sabines and Oscans; and a black ware, the paste or substance of which is black throughout, not superficial, as amongst the Greeks, and made by mixing some colouring material with the clay. The Etruscan pottery is rarely painted—the black ware never—but it is distinguished by having ornaments in salient and bas-relief modelled or moulded on it, and by the shapes of the vases apparently being derived from works in metal, and reproducing the fantastic combinations of oriental art. This ware, which was in use from 500 to 320 B. C., was the source from which subsequently arose the Arretine and Roman pottery. It was ornamented sometimes with incised ornaments; the subjects, however, are generally uninteresting, and it never attained a high position in art. The Etruscans, however, in later times imitated the painted vases of Greece, but their clay is much paler, the drawing coarser, and the shapes less elegant. In terra cotta statues, they particularly excelled, and supplied the Romans with the figures of their divinities. Even sarcophagi were made of this material.

On the decline of the pottery of the Greeks and Etruscans, a new kind of ware was made at Arezzo, or Arretium, to which has been given the name of Arretine, and which resembled the latter ware of the Greeks. It is evidently imitated from works in metals, in all probability from the chased cups of silver and gold which began to come into use in Italy, and was a continuation of the latter moulded wares of Greece and Italy. The vases were of a bright red or black colour; the paste, uniform in colour throughout, but covered with a lustrous silicious glaze. The red colour nearly resembles in colour and texture a coarse sealing-wax, the paste is often remarkably fine. The vases, generally of small dimension, were turned on the lathe; the ornaments were moulded separately, and attached to the vase: patterns were produced by the repetition of the same mould, or by placing bas-reliefs from various moulds on the vases. This kind of pottery was first made at Arezzo, but subsequently, or nearly simultaneously, was produced at Capua and Cumæ in the 1st c. A. D. It afterwards extended over all the Roman world, and was made in Gaul and Germany. It was called Samian ware under the republic, and was at first extremely fine, but deteriorated under the last of the twelve Cæsars, and is no longer found under the Antonines; a red ware, glazed with red-lead and copper, having been substituted for it. The names of several hundred potters are found stamped upon extant specimens of this ware, and some of them are evidently of Gaulish or British origin. These names are followed by *F.*, *fecit*, or made; *M.*, *manu*, or by the hand of; and *OF.*, *officina*, or establishment. The ware was extensively imported into Britain and the remoter provinces of the empire; and wherever found, shews the influence of Roman civilisation. Furnaces for it have been found in France and Germany, but not in England. The other kinds of Roman ware were local, evidently made upon the spots where found, but with inferior ornamentation. Black-ware seems to have succeeded this, and to have been produced by confining the smoke of the furnace, and throwing it down upon the heated ware. In

Britain, varieties of this ware were made at Castor in Northamptonshire, ornamented with bas-relief, laid on by the process of depositing a fluid clay on the wet ware, and moulding it with a tool. The style of art is Gaulish. Other vases of glazed ware

Fig. 5.—Anglo Roman Vase [Castor].

Fig. 6.—Roman Vase.

were manufactured at Upchurch near Rochester, and at Crockhill in the New Forest. They have only a few ornaments, either stamped or painted in a white pipeclay on the surface. These vases are probably as late as the 3d c. A. D. Later, arose a black-ware, generally bottles or jugs, glazed externally, and with single words, invitations to

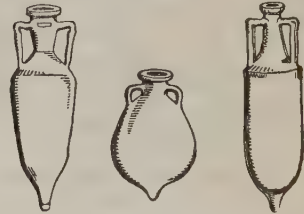

Fig. 7.—Roman Amphoræ.

drinking, painted on them, in a white pipeclay. Many varieties of unglazed ware, red, yellow, white, and gray, were extant in the 2d and 3d centuries.

The large culinary and other vessels were made of these—such as casks (*dolia*), amphoræ, jugs (*lagenæ*), and mortars (*mortaria*)—the last at Lyon. The Romans made great use of brickwork terra cotta. All over the empire, bricks were made for public and private buildings, and stamped at Rome with the name

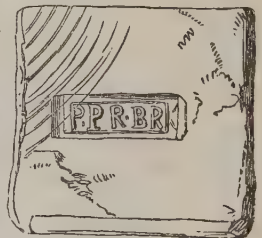

Fig. 8.—Roman Flango Tile. of the proprietors of the land, the potters, and the consulate of the period, till the middle of the 3d c. A. D. Bricks were also

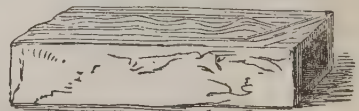

Fig. 9.—Roman Flue Tile.

extensively manufactured by the legionaries, and bear their names and titles. The graves of the

soldiery were often constructed of them. At Rome, the last inscribed bricks are those of Theodoric; none so late have been found in Britain or Gaul. Tiles, cornices, roof-ornaments, and gutters were formed of terra cotta, so were the votive figures offered to the gods; but they all disappeared at the invasion of the northern barbarians, although they continued till then to be manufactured by local potteries.

Among the northern nations, especially the Celts and Scandinavians, long prior to the Roman conquests of Gaul and Britain, at the remote age of the Stone and Bronze Periods, large and small vases, perhaps originally employed for domestic, but subsequently for mortuary purposes, are found amongst the cromlechs, the tumuli, and graves of Northern Europe. They are formed of a coarse clay, mixed with small pebbles, and have been feebly baked by surrounding them with hay, dried ferns, or other combustible vegetable matters, which have been burned inside and around them. The interior of the walls are black; the exterior, of a pale brown colour. Their mouths are large, the ornaments, hatchings, and rude line sometimes making an elaborate pattern or tattooing all over the vase. Those from Britain were called *bascaude*, or baskets, by the Romans. A modification of this class of ware was continued under the Saxons and Merovingians, and is distinct from the Gallo-Roman and Romano-British potteries: the clay being better baked, and the ornaments, stamped or impressed from a mould, more regular. The use of pottery among these races was to a great extent superseded by glass, metal, and other substances for drinking and culinary vessels, and few or no specimens of medieval unglazed vessels are known. Terra cotta, indeed, continued to be applied for making figures from the 14th to the 18th c. in Europe; but in England, even the use of bricks, a manufacture difficult to have been lost, was restored by Alfred. Unglazed ware was, in fact, superseded or abandoned in Europe after the fall of the Roman empire; but in modern times, the use of terra cotta and such like ware is found extended all over Europe, Asia, and Africa, varying in texture and excellence from the coarse flower-pots to the thin and graceful water-bottles of the Arabs and modern Egyptians. Even the Nigritic races continue to manufacture a feebly baked earthenware, rudely coloured with pigments not baked on the ware. In the New World, the existence of unglazed earthenware seems to date from the most remote antiquity. The vases and other objects found in the northern portions of America, indeed, are of the rudest kind, and bear a striking resemblance to those of the early Scandinavian, Celtic, and Teutonic graves, in paste, shape, and ornamentation. The Mexican and Peruvian potteries, however, evince a much greater mastery of the art, and both are modelled with great spirit, gaily coloured, and profusely ornamented. Some of the oldest Peruvian wares, indeed, rival in their modelling European art; but they never attain to glazing. The other unglazed wares of the New World differ according to the localities where they have been manufactured, and in the most highly-civilised portions, reflect or rival the arts of the people by which it has been colonised. Those of the existing native races are very feeble, and the processes are sometimes accompanied by magic ceremonies. The pottery of the southern hemisphere is quite recent, as none of the races seem to have been acquainted with the art. The Fijis, indeed, have a ware glazed with the resin of a tree, but it appears to have been derived from Europe.

The knowledge of glazes originally acquired by the Egyptians and Assyrians, was continued under

the Roman empire at Alexandria, and appears to have been transmitted to the Persians, Moors, and Arabs. Fayences, and enamelled bricks and plaques, were in use among them in the 12th c., and among the Hindus in the 14th c. A. D. The Moors introduced into Spain the use of glazed tiles about 711 A. D., examples of which, called *Azulejos*, as old as the 13th c., are found in the Alhambra. Besides these, the manufacture of glazed or enamelled fayences in Spain, distinguished by a metallic iridescence, came into use from the 13th c. in Spain. In Italy, they are supposed to have been introduced as early as the conquest of Majorca by the Pisans, 1115 A. D.; but the first appearance of Italian enamelled fayence, the precursor of modern porcelain, does not date earlier than about 1420, when it was used for subjects in relief by Lucca della Robbia. About a century later, plates and other ware were manufactured at Pesaro and Gubbio, decorated with subjects derived from the compositions of Raphael and Marc Antonio, painted in gay and brilliant colours. But the establishment was abandoned in 1574, although pieces of *majolica* continued to be fabricated in various cities of Italy till the 18th century. From Italy, this enamelled ware was passed into France in 1590 with Catharine de' Medici, where it was manufactured till the end of the 17th century. In 1555, the celebrated Palissy discovered at Saintes the art of glazing or enamelling a gray paste, and introduced dishes and other objects with fruit, fish, and animals moulded from life, distributed over the surface, as a kind of ornamental ware. At the same time, or earlier,

Fig. 10.—Vase of Henry II. ware.

was made what is called Henry II. ware, and which is now so precious, consisting of glazed white ornamental pieces. Glazed or Norman tiles, however, as they are called, date from two centuries before. At the close of the 13th c., glazed ware was made in Alsace; but it was not till two centuries later that *majolica* was fabricated at Nuremberg; and the manufacture was continued in various parts of Germany till the 18th century. Delft, which gave its name to its own fabric, is said to have produced a glazed ware as early as 1360, and continued to do so till the 19th century.

Holland was chiefly celebrated for its bottles of stoneware, glazed by salt, called *Bellarmines* Graybeards, or Bonifaces, and for its tankards which were imported all over Europe, in the 16th c.

and are repeatedly found in London excavations. In England, glazed tiles for religious purposes

Fig. 11.—Tyg with two handles, 14th century.

for Lambeth, where they established themselves in 1710. From this period, various improvements were introduced by Astbury, Booth, and finally by Wedgewood, who discovered more suitable clays in 1759, and called to his assistance the arts of

Fig. 12.—Tyg of Staffordshire ware.

design, by the employment of Flaxman for bas-reliefs and figures. The applications of copper-plate printing and gilding were subsequently discovered. Still later, other materials, as felspar and bones, were used in the composition of this pottery. Delft-stone and other wares were made at different places, as Liverpool, Lowestoft, and elsewhere; but, after different vicissitudes, most of the potteries have disappeared except those of the stoneware at Lambeth and Vauxhall.

None of this ware, however, was of the nature of the Chinese porcelain which had been imported by the Arabs in the 13th c., was known in Italy in 1330, and was imported into France as early as 1370, and into England much later. The name porcelain, from *porcellana*, an obscure Portuguese word, supposed to mean a shell, is applied to a mixture of alumina or *kaolin* and silice or *petuntse*, which, when baked, does not fuse at a temperature as high as 140° of Wedgewood's pyrometer, and the glaze of which is incapable of being scratched by a knife. This porcelain, called 'hard porcelain,' is said to have been invented at Sin-ping in China, about 185 B.C., and rose to great importance at King-te-chin, 557 A.D., where, in 1712,

3000 furnaces were in activity, and where the manufacture is still carried on. There are about 18 renowned potteries in the empire. The art of pottery in China is said to be as old as 2599 B.C. In Japan, hard porcelain dates from 27 B.C.; translucent porcelain was made about 672 A.D.; but between 1211 and 1221, Kotosiro, a Japanese potter, went to China to improve his process. There are 18 celebrated potteries in Japan; and in modern times, the pieces exported come chiefly from Imali, in the province of Fizen. In 1644, the Dutch exported 44,943 pieces from Japan. At the beginning of the 16th c., the porcelain of China began to be extensively imported into Europe, and various unsuccessful attempts were made to discover the secret of its manufacture, but without success, both as to the material and the process. The Persians, indeed, are said to have produced translucent pottery about the 15th c. A.D.

After some trials, which resulted either in the production of a kind of opaque glass or stoneware, Böttcher or Böttger, an alchemist (who had been seized by Frederick Augustus II. in 1701), after Schnorr, in 1709, had discovered white *kaolin* at Aue, produced from it a white hard porcelain at Meissen, near Dresden; and the porcelain establishment there was founded under royal auspices. Extraordinary precautions were taken to prevent the process being discovered, by imposing oaths upon the workmen, and the process there pursued was not communicated till 1812 to Brongniart. The secret, however, was betrayed by Stöfel, a workman of Meissen, who fled to Vienna in 1720, where an imperial establishment was founded, which exists to this day. Other workmen carried the secret from those establishments all over Germany. Royal works were set up at Berlin in 1755, at St Petersburg in 1744, and at Munich in 1758. From this period, two different kinds of porcelain were made in Europe, a soft and

a hard. In France, soft porcelain was made at St Cloud in 1695, and was not discontinued till 1804. The accidental discovery, by Madame Darnet, of *kaolin* at St Yrieix la Perche, in 1765, led to the production of hard porcelain at Sèvres, where, after 1800, only this kind was made. Various places in France made both kinds; and in Italy, both were produced at La Doccia, near Florence, at Capo di Monte, near Naples, and at Venice. Other establishments flourish at Madrid and Oporto, established in the 18th century. The manufacture of soft porcelain appears to have been introduced in England, at Bow, as early as the 17th c., and the Chelsea works were

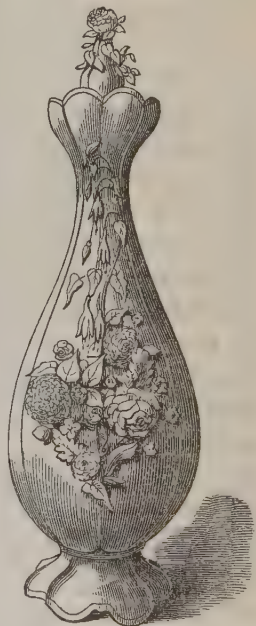

Fig. 13.—Staffordshire Minton.

set up still earlier, according to some, by Elers. Thence the art was transferred to Derby in 1748; and an establishment

at Worcester, founded in 1751 by Dr Wall, is said to have first printed on porcelain. Hard porcelain was made by Cookworthy at Plymouth in 1705, and afterwards at Bristol, but was subsequently abandoned as unprofitable, although again made by Minton in Staffordshire in 1850. One of the last inventions in porcelain has been the introduction of Parian, or statuary, used for the production of small figures and statues, by Copeland and Minton. Amongst the oriental nations, the production of porcelain seems limited to China and Japan, although fayences and glazed wares are manufactured all over the East. The production of a white porcelain, either soft or hard, capable of being moulded and painted with various colours, effected a revolution in the ceramic art: sculptors were employed to mould small figures and other objects by the different establishments, and the vases, which at first were decorated with rude copies or poor imitations of their Chinese originals, by degrees introduced on their surfaces the art of the country where they were made. The paintings on porcelain thus resembled those on enamel, and when the pieces were of considerable dimensions, and painted by distinguished artists, became of great value. Thus, copies of works of Raphael and of Tintoretto, in the Exhibition of 1851, were valued at £1000 and £880. Even ordinary cups, when painted with vignettes, have their value much augmented. So also the application of delicate colours, as blue, green, and rose-pink, added a charm not found in the monochrome glazed ware of the middle ages. For these, Dresden and Sèvres were formerly unrivalled; but the colours of late years have been changed, and do not equal the old. The style of art has varied in each century; the old rococo shapes having been superseded at the commencement of this century by classical shapes, and again by modified medieval forms. The present age has been distinguished by an attempt to reproduce *majolica*, *palissy*, and other wares; by the improvement of printing in colours; by the invention of statuary porcelain, and an application of the material to other purposes, as buttons, stamped or pressed from a mould or die. Besides the ornamentation of vases, a trade-mark is often added, either stamped in or painted on the ware. This, on the early *majolica*, had the date, place, and name of the artist; but the Dresden, Sèvres, Chelsea, and other establishments introduced devices, monograms, arms, &c., as swords, anchors, crowns, and other devices. The Chinese has devices, mottoes, names of makers, and the date of the reign when made, commencing with the first monarch of the Ming dynasty about 1480, generally in red colour, and imitating the seals or stamps used for sealing documents. These marks are continued to the present day (see below).

Manufacture.—The dough-like condition into which clay can be worked with water, and the hardness it may be made to acquire by burning, are qualities which have been turned to account by man from the earliest times, and it is upon these that the potter's art essentially depends; but there is great variety in clay, and it is only by knowing something of its nature and constituents, that any real advance has been effected in pottery. If a piece of clay be examined, it will be found that it consists of exceedingly minute particles, held

together by aggregation when moist; but if dried, it can be easily reduced to an impalpable powder by mere pressure; and if, instead of drying, we add an excess of water, it may be so mixed and held in suspension in the water that it appears almost to be dissolved. In time, however, it is deposited as a sediment, and when the excess of water is removed, it is a soft tenacious paste, which is so non-elastic that it will retain the smallest impression made in it without change. This minute division of its particles, and the absence of elasticity, are its most valuable qualities. But all clays are not of the same purity and quality; the commonest is that of brick-fields, which is one of the most abundant substances in nature; but it is so mixed up with iron and other foreign ingredients, that except for bricks, tiles, and the coarsest kinds of pottery, it is not used.

The purest kinds of potters' clay are called *kaolin*, and are believed to have been formed by the decomposition of rocks containing large proportions of felspar, a slightly variable compound substance, which, in general terms, may be said to be a combination of neutral silicate of alumina and the silicates of potash, soda, lime, or magnesia, together or singly. Certain kinds of granitic rocks, especially the whiter varieties, by their atmospheric decomposition, yield fine kaolin. Great experience is required in selecting and using the materials, because in nature the plastic materials are very irregularly mixed with other substances, which have a more or less deteriorating effect. Most of the best known clays contain a certain portion of free silica in addition to that in combination as natural silicate, which requires to be removed for very fine wares by boiling in caustic potash, otherwise, it proves injurious. The finest china-clay of Great Britain is obtained from Cornwall, where the decomposed granite is washed by streams of water, which carry it away into ponds called *catchpools*. The discovery of this source of china-clay was made by Mr Cookworthy about the middle of last century, and alone afforded means for improving our native pottery, which were most admirably turned to account by Mr Josiah Wedgewood, and after him, by Mr Herbert Minton, Mr Copeland, and others. Previous to this, although, as before noticed, fine pottery was made in Britain in two or three places, yet the general character of our pottery, which was chiefly manufactured in the neighbourhood of Burslem, in Staffordshire, was most miserable both in material and in design. The clay was inferior in colour, prepared with very little care, and covered with a coarse white or yellow lead glaze; but the discovery of the Cornish clay, by affording a material of excellent quality, stimulated the manufacturers to improve the general style of their manufacture. Scarcely second in importance to this discovery was Wedgewood's good taste and untiring zeal in working out that revolution in the art of the British potter, that has led to its present enormous development. In 1730, when Wedgewood was born at Burslem, in Staffordshire, that place supplied the greater part of the common household pottery of Great Britain; but so small was the trade, that it was but little more than a village encumbered with heaps of broken crockery, and its environs disfigured with clay-pits and piles of refuse; now it is the centre of a populous district called 'The Potteries,' comprising about 48 square miles. In this limited space there are now nearly 280 kilns at work, employing more than 100,000 operatives.

The method pursued in making pottery and porcelain is the same in principle everywhere; we shall therefore give the general outline of the process without entering into the minute differences which distinguish the variations produced by

different manufacturers in this and other countries. Pottery and porcelain differ chiefly in this, that the superior quality of the materials used in making the latter gives it a peculiar translucency. For pottery, inferior materials are used, and a considerable admixture of calcined flint, bone-ashes, or native phosphate of lime, is added to the clay. The use of the calcined flint was said to have been first adopted by a Burslem potter named Astbury, who, whilst travelling to London on horseback, in the year 1720, had occasion, in passing through Dunstable, to seek the assistance of an hostler, in consequence of some disease in his horse's eyes. He noticed that the man took a piece of flint, burned it, and then reduced it to a fine powder, which he blew into the horse's eyes. Astbury, noticing the beautiful whiteness of the powder, conceived the idea of using it in his pottery; and did so with great success.

The ingredients, such as the clay and calcined flints, are ground by separate means; the former in the pug-mill, which is represented in fig. 14. This is an upright, iron-bound, wooden cylinder, with an axis A turned by machinery; projecting from A are seven arms, *b*, each of which has three knives fixed in it, with the points outward, and so arranged that they spread over the largest amount of space in the interior; and altogether they are placed in a spiral manner, so that when in motion,

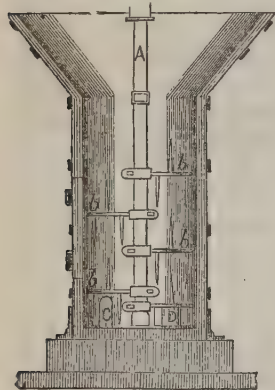

Fig. 14.

the clay, which is thrown in lumps into the hopper-shaped upper part of the vat, is worked down, and is so cut and kneaded by the knives, that it is forced out at an opening at C, in the state of soft pap. This is aided by the knives on the lower part of the lowest arm being connected together by a plate D, which prevents all settlement at the bottom. This pap-like clay passes into a large wooden tank, in which it is agitated with water until quite incorporated, so as to resemble milk in colour and consistency. In another mill (fig. 15), of a different construction,

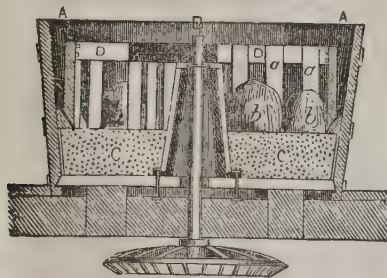

Fig. 15.

the Cornish granite and calcined flints are being reduced to a somewhat similar state. This mill is very strongly constructed, and consists of a tub-like vat A, in the centre of which turns an axle B,

moved by machinery; in the bottom of the vat is a thick stone-bed C, consisting either of chert or horn stone. From the upper part of the axis, three strong arms D, D, D, project like the spokes of a wheel; and strongly attached to these are stout beams, *a*, pointing downward, and nearly touching the stone-bed C. As the axis, with its arms and beams, turns round, the beams push some large masses of the Cornish granite or of chert stone round with them, and these triturate the calcined flints and other hard materials, and stir up the water with which the vat is kept constantly supplied, whilst it overflows in a milky state, charged with the finely-divided materials, into a cistern, where it is kept stirred until it is sufficiently supplied with the solid materials, and the thickened milky liquid is then drawn off, in proper proportions, into a vat to which the prepared clay is also passed. The mixture of the two is then allowed to subside until the water is nearly clear, when it is drawn off; and the sediment is deprived of its surplus moisture, either by evaporation, or, in the best works, by a pneumatic-exhausting apparatus, which does it very quickly. The composition is then a fine plastic material of the consistency of tough dough, and is ready for the potter's use. In preparing the finer materials for porcelain, many other operations are required, all, however, having the same object, viz., the extremely minute division of the substances used.

The prepared clay is taken to the *throwing-machine*, or *potter's lathe*, which is represented in fig. 16. This consists of a fixed table A, through

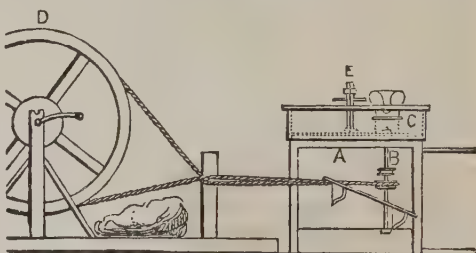

Fig. 16.

which passes the axle B, and rises a little above its surface, and having on its upper end a disc C, which revolves with it. The axle is put into rapid motion by turning the fly-wheel D, either by hand or machinery; and this causes a rapid revolution of the disc C, upon which is placed the soft mass of clay to be moulded. At E is seen an upright, with a small sliding-bar regulated by a screw; this is the guide for the potter to regulate the height of the vessel he is making. When the lump of clay is revolving, the potter, with his hands or with proper tools, fashions it into any shape he pleases; his management of this requires considerable skill, as nearly every article requires a different configuration. But some articles are formed in moulds, the moulds being made of plaster of Paris. This answers well for fine porcelain intended to be very thin, because the plaster-mould absorbs much of the moisture in the paste, and thus partially dries

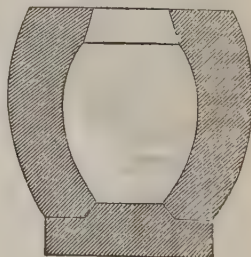

Fig. 17.

it, so that it admits of handling, which in a softer state would be very difficult. The paste is used so liquid that it can be poured into the

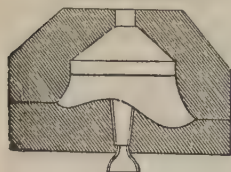

Fig. 18.

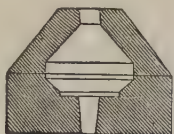

Fig. 19.

moulds. It is usual, in casting, to have a mould for each part, as seen in figs. 17, 18, 19, which represent the body, neck and lip, and foot of the cream-ewer, fig. 20.

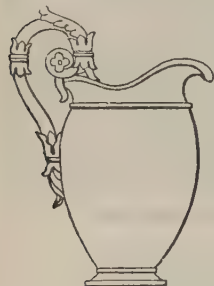

Fig. 20.

For nearly flat articles, such as dinner-plates, a plan is adopted which combines both processes: a mould, usually of plaster, fig. 21, *a*, is placed on the disc of the throwing-wheel, *b*, and a thin layer of the paste is pressed on to it, so as completely to take its form; then to the guide-post, *c*, is attached an arm, *d*, with a small brass plate, *e*, on its lower side.

This plate is cut to the outline of half the plate, or dish; as it revolves, this pares down and

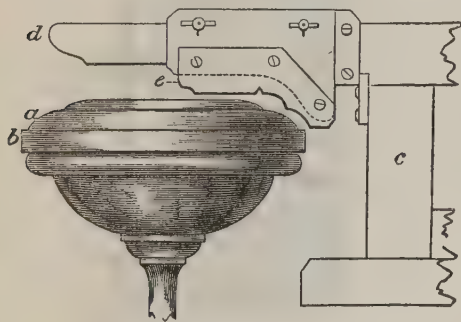

Fig. 21.

shapes the clay to its own outline, and to the thickness to which it is set, there being an arrangement on the arm of the guide-post by which this can be effected. Sometimes, as in the case of deep vessels, moulds are used for the exterior, and the interior is formed by the hand. This process (fig. 22) insures certainty of size and shape, which is important in making large numbers of similar articles, as tea-cups, &c. The mould is lined with a thin cake of clay, and when placed on the revolving disc, it is fashioned inside by hand, and finished off with a wet sponge.

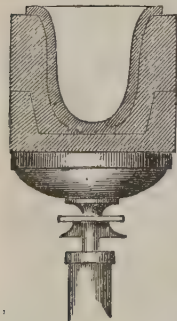

Fig. 22.

Sometimes metal or horn tools are used for producing mouldings and other raised ornaments, or for grooves, when the turning or

throwing wheel is used. If the articles made require handles or other similar accessory parts, they are always moulded, unless of very simple forms, and are attached whilst they and the body are still soft enough. They are joined by a thin fluid paste called a *slip*, and the junction is smoothed over with the wet sponge, which is one of the most useful of the potter's tools. Being formed, the articles, of whatever kind, are now taken to the drying-stove, where they are placed on shelves, and remain there some time, exposed to a heat of about 85° Fahr. When quite

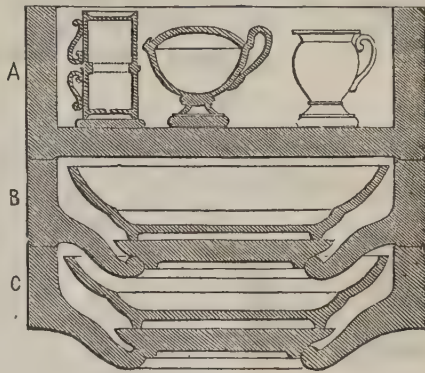

Fig. 23.

dry, they are next taken to a workshop near the kiln, and they are here carefully packed in coarse earthenware vessels, called *seggars* (fig. 23), which

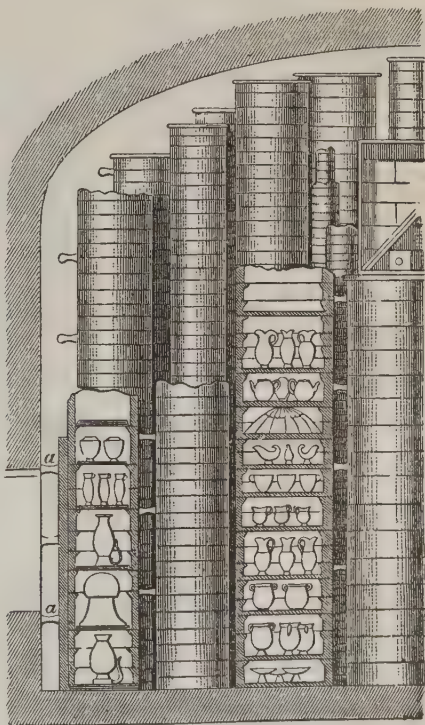

Fig. 24.

are so made that they can be piled upon one

another to a great height in the kiln, as seen in fig. 24, in which some of the seggars are seen in section, for the purpose of making the arrangement more intelligible. As the seggars are generally made large enough to hold a number of articles, which would, when highly heated, adhere if they touched, a number of curiously shaped pieces of

Fig. 25.

burned clay are used for placing between them, so as to make them rest on points; these are called *wedges, cockspurs, triangles, stills, &c.*, fig. 25. In

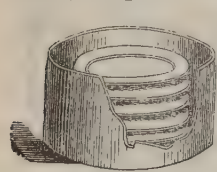

Fig. 26.

the seggar, filled with plates (fig. 26), the plates are seen each resting on *cockspurs*, which prevent them touching. Another object is gained by this, in burning flat articles such as plates; these, if placed one upon another, would not be fired equally, but when they are held apart, the heat affects all parts alike. The seggars are so piled in the kiln that the centre is hollow, and there are free spaces between them through which the fire can ascend; props, *a, a, a*, fig. 24, being so placed as to keep them from immediate contact with the sides all round. Thus, each seggar forms a small oven, in which one or more pieces of pottery or porcelain are baked, and the seggars prevent any unequal heating of the pieces, and also protect them from smoke. A kiln has generally eight furnaces, and it is usual to raise six piles of seggars between every two furnaces, or rather between their flues, which rise to a considerable height in the kilns. Each pile of seggars is technically called a *bung*, so that there are generally 48 or 50 bungs to the charge of a kiln. When all this is arranged, the furnaces are lighted, and great care is taken to have the best coal, as it enables the manufacturer to make a more certain calculation as to its effects, and is less liable to smoke and sulphureous vapours, which might injuriously affect the contents of the kiln. The baking or firing requires great care and attention, and there are many nice regulations connected with it to guide the workman. It usually lasts from 40 to 42 hours. The fire is then allowed to go out, and the kiln to cool very gradually, after which it is opened, and the seggars removed, to be unpacked in a separate workshop. The articles are now in the state called *biscuit-ware*, and require both the glaze and any patterns they may be intended to bear. Common pottery is often figured by printing the design in enamel colours on paper, and whilst the printing is still wet, applying it to the *biscuit-ware*; the ware absorbs the enamel ink, and the paper is removed by water, leaving the pattern on the ware. It is then fired in seggars, or a muffle, to fix the colour, and is then dipped into composition called *glaze*, of which three kinds are used in the Staffordshire potteries. The first, for common pipeclay ware, is composed of Cornish granite, 16 parts; flint, 36 parts; white-lead, 53 parts; and cullet, or broken flint-glass, 4 parts. These materials are

tritulated with water, with the same care and by similar means to those employed in forming paste, and are reduced with water to the same milk-like liquidity. Each workman has a tub of the glaze before him; and as the articles of *biscuit-ware*, either with or without decorations, are brought to him, he dips them in the glaze, so as to insure a uniform coating over them; and by nice management, he prevents any large drops or accumulations on one part more than another. The porous *biscuit-ware* rapidly absorbs the moisture, and dries up the thin film of glaze on the surface of the articles, which are again placed in seggars, and carried to the glaze-kiln, where they undergo another firing, which melts the glaze, and converts it into a perfectly transparent glass, like water, all over the surface, and renders any pattern previously printed upon it very plain. The temperature in the glaze or enamel kiln is only increased very gradually, and is kept up for about 14 hours, after which it is allowed to cool slowly, and the articles are taken out completed. So far, this description has been applied to the manufacture of pottery and porcelain on a large scale, for general purposes; but when it is applied to more costly and artistic works, very special arrangements are required; and in the case of remarkably fine pieces, instead of the huge kilns, which hold frequently many thousand pieces, muffle furnaces (fig. 27) are both used for the

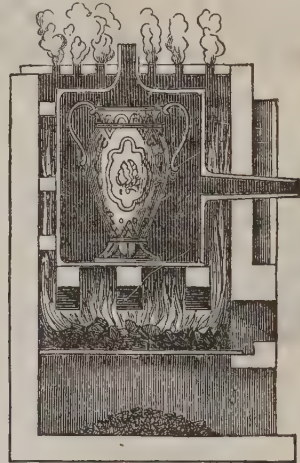

Fig. 27.

biscuit, the glaze, and the coloured and gilded decorations, which, in porcelain, are applied on the glaze, and not on the *biscuit*.

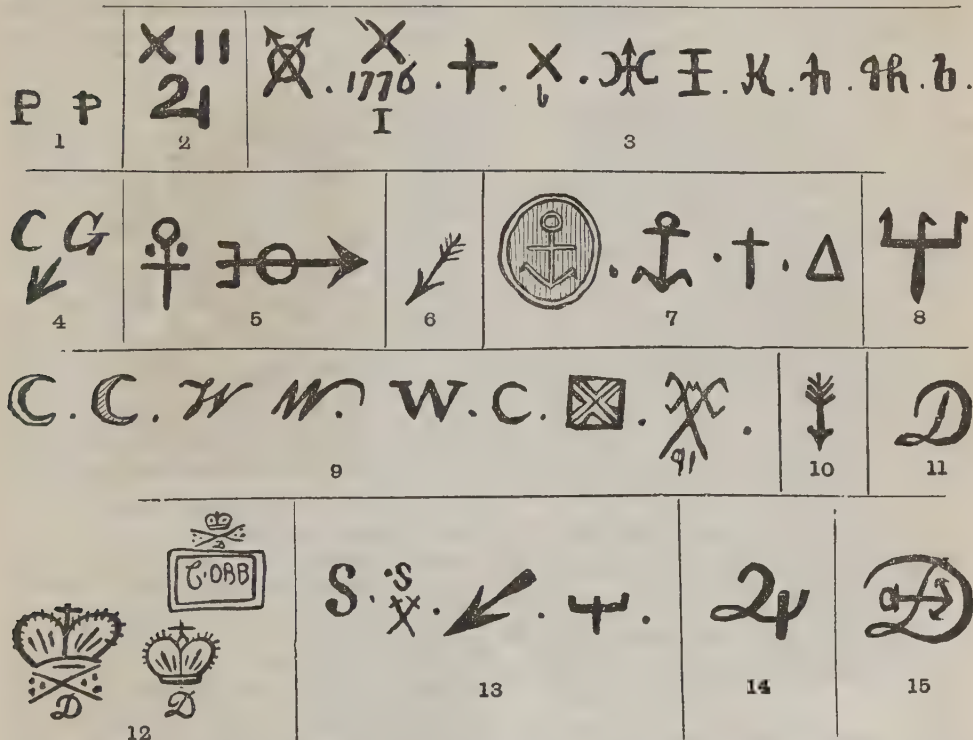

The decoration of porcelain has long held a high rank as a fine art; and the exquisite skill shewn in some of the finest works of the continental manufactures, and lately in those of Britain, has fairly entitled it to that rank. The colours employed are all coloured glasses ground to impalpable powders, and mixed with borax or some other fluxing material; for use, they are generally made liquid with oil of spike, and they are laid on with hair-pencils, in the same way as oil-colours. The whole process is exactly the same as in painting or staining glass; the glaze on the *biscuit-porcelain* being true glass, and the enamel colours being exactly the same as those used by the glass decorator. The colours may be made by mixing the materials of which glass is made with the colouring material and the flux, or simply with the already coloured glass and the flux. When the former plan is employed, the following

are the colouring materials employed: oxide of chromium for green; oxide of iron for red, brown, violet, gray, and yellow; oxide of uranium for orange, yellow, black; oxide of manganese for violet, brown, black, and purple; oxide of cobalt for blue, gray, and black; oxide of antimony for yellow; oxide of titanium for yellow; oxide of copper for green; suboxide of copper for red; sesquioxide of iridium for fine black; protochromate of iron for brown; chromate of lead for yellow; chromate of barytes for yellow; chloride of silver for deepening reds and purples; purple of cassius for ruby and purple. Several of these colours are much increased in brilliancy by the addition of oxide of zinc, which of itself gives no colour; and the transparent ones are rendered opaque by the addition of oxide of tin.

Other fluxes besides borax, or borate of soda, are used—as sand, felspar, boracic acid, minium or litharge, salt, saltpetre, potash, and soda. Nothing enriches the appearance of porcelain more than good gilding; for this purpose, gold-leaf is rubbed down with oil of turpentine; or pulverulent gold is produced by precipitating a solution of gold in aqua-regia, by the addition of a solution of sulphate of iron. The gold is precipitated as a brown powder, which is washed and dried, and then worked up with one-sixteenth of its weight of oxide of bismuth

and oil of turpentine. It is painted on, then fired, and afterwards burnished. Peculiar and beautiful metallic lustres are produced upon pottery by precipitated platinum and other means; but it is not within the scope of this article to enter into all the details by which the almost numberless variations are produced in the manufacture and decoration of this material. The literature relating to its history is rich in treatises for the guidance of those engaged in the art.

The following are the chief varieties of ceramic materials, and their usual composition: 1. *Porcelain*.—At Sèvres, kaolin, 48 parts; sand (pure white), 48 parts; chalk, 4 parts. At Dresden, kaolin, 62 parts; felspar, 26 parts; broken biscuit-porcelain, 2 parts. At Berlin, kaolin, 76 parts; felspar, 24 parts. In England, three mixtures are used—For common china, ground flints, 75 parts; calcined bones, 180 parts; china-clay, 40 parts; clay, 70 parts. For fine china, ground flints, 66 parts; calcined bones, 100 parts; china-clay, 96 parts; Cornish granite, 80 parts. Fine, for modelling figures, &c., Lynn sand, 150 parts; calcined bones, 300 parts china-clay, 100 parts; potash, 107 parts. The glazes require to be varied for nearly all, so that their fusibility may be greater or less, according to the more or less fusible character of the biscuit

- 1, Pennington, Liverpool, 1760—1780; 2, Plymouth, about 1760; 3, Richard Champion, Bristol, 1772—1790; 4, Charles Green, Leeds, 1790; 5, Bow, 1730—1790; 6, Absolon, Yarmouth, about 1790; 7, Chelsea, 1730—1784; 8, Swansea, Wales, 1790; 9, Worcester, 1760—1780; 10, Yarmouth, about 1790; 11, Derby, 1751—1769; 12, Crown, Derby, 1780—1830; 13, Shropshire, 1772—1799; 14, Cookworthy, Plymouth, 1760; 15, Derby—Chelsea, 1770.

ingredients. 2. *Parian*.—The composition for this is the same as that for the fine English china, but it is used in a liquid state, so as to be poured into the plaster of Paris moulds. It requires very great care in the firing. 3. *Earthenware* (Fr. *Faïence*.

from *Fayenza*, the name of a place in Italy where it was made; Dutch, *Delft*, from its having been chiefly made at Delft, in Holland).—Made of various kinds of clay, varying in colour from yellow to white, according to the quality required; and

more or less of powdered calcined flints are mixed with it, to give it body and hardness. Sometimes, as in porous vessels, only clay is used. 4. *Stoneware*, such as is used for jars, bottles, drain-pipes, &c., is made of several kinds of plastic clay, mixed with felspar and sand, and occasionally a little lime, but the materials vary much in different localities.

In Great Britain, the potteries not only supply the demand, but are estimated to export about £1,300,000 annually. The entire produce in 1868 was £3,000,000. In 1852, there were 185 establishments; 70,000 operatives were employed, and \$4,000,000 pieces exported. England, France, and Germany only export; England to the greatest amount. Of French pottery the annual value of fine faience made at Paris is alone estimated at 10,000,000, and that of porcelain at 20,000,000 francs. The value of the imports into the U. States in the years 1869—70 were, brown-earthen and common stone ware, \$47,456; of porcelain and parian ware, \$851,247, and of all other earthen, stone and crockery ware, \$3,461,524; total, \$4,360,227.

Most of the celebrated manufacturers of pottery and porcelain, both at home and abroad, have employed a special mark to distinguish their works, and these are now of considerable importance in enabling us to ascertain the origin of choice specimens. On the preceding page are given some of the most important marks and monograms, so used by the earlier English makers, when their names in full were not imprinted, as was often the case.

POTTO. See KINKAJOU.

POTTSVILLE, a city of Pennsylvania, on the Schuylkill River, at the entrance of Norwegian Creek, 93 miles north-west of Philadelphia, with which it is connected by railway. It is in the midst of a rich anthracite coal region, and has iron foundries, a brass foundry, manufactures of iron safes, sashes, and wood-work; county buildings; 3 English, 3 German, and 1 Welsh paper; and 16 churches, 3 of which are Welsh. Pop. in 1870, 12,384; in 1880, 13,253.

POTY, a district town, and rising seaport of Russia, in the Caucasian government of Kutais, stands at the mouth of the river Rion, on the eastern shore of the Black Sea. The Rion connects the port with the interior, and since the establishment of regular steam communication by the Russian Trade and Navigation Company in this quarter, the commerce and especially the transit-trade of this town have greatly increased. Pop. 1309.

POUCH, MILITARY, a stout leather box, black or brown, lined with tin, covered with a strong flap, and ornamented with the device of the regiment, serves to carry the cartridges required by a soldier for immediate use. When cartridges are supplied for a whole day's service, two pouches are worn, one on the front point of the hip, and a larger one on a belt suspended over the left shoulder.

POUCHED RAT (*Geomys* and *Thomomys*), a group of *Rodentia*, of which there are several species, natives of parts of North America west of the Mississippi and along the Gulf, and some of them very troublesome from the ravages they commit in fields and gardens. They have four molars on each side in each jaw. The tail is short. The cheeks are furnished with pouches, to which the name refers, the openings of which are from the outside, and not from the mouth. The pouched rats burrow in the ground, and do great mischief to root-crops.

POUGHKEE'PSIE, a city of New York, U. S., on the east bank of the Hudson River, 75 miles north of New York, finely situated on a table-land,

about 200 feet above the river. The city has broad and handsome streets, with fine public and private edifices. The collegiate school is situated on an eminence which rises 500 feet above the river, and from which a magnificent prospect, embracing an area 2500 square miles in extent, may be obtained. P. contains a city-hall, academy, law-school, lyceum, orphan asylum, public schools, the Vassar Female College, a rural cemetery, banks, iron-works; carriage, chair, and carpet factories; breweries, 21 churches, and has railway and steamboat communication with New York and Albany. P. was settled by the Dutch in 1690; during the Revolution, it was the state capital, and the Convention met here, 1788, to ratify the constitution of the United States. Pop. in 1870, 20,080; in 1880, 20,207.

POULPE (*Octopus*), a genus of *Cephalopoda* (q. v.), of the order *Dibranchiata*; having eight feet or arms, nearly equal, united at the base by a membrane, and very long in proportion to the body. There is no shell, but it is represented by two small grains of horny substance imbedded in the back, one on each side. The arms are used for swimming in water, creeping on land, and seizing prey. Poulpes swim by contractions of the muscular web of the body, which extends upon the arms. They creep on shore in a spider-like manner, with sprawling arms. Like other cephalopods, when alarmed or annoyed, they discharge an inky fluid. One species (*O. vulgaris*) is occasionally found on the British shores, and is more common on the southern shores of Europe, and elsewhere in the Mediterranean. It is the *Polypus* of the ancients. Its arms are six times as long as its body, and each furnished with 120 pairs of suckers. (See CEPHALOPODA.)—In warmer seas, very large species occur; and although the stories related of their laying hold of and swamping boats, seizing and killing swimmers, &c., may probably be fabulous, yet it is certain that some of them have arms at least two feet long, and there is probable reason to suppose that much larger species exist, which must be powerful and dangerous creatures. A P., with its eyes fixed on its adversary, and its beak threatening to approach, must have a sufficiently formidable aspect. It was no doubt a P. which Mr Beale encountered on the shore of the Bonin Islands, which he attempted to intercept in its retreat towards the sea, and which turned and fastened upon him, laying hold of him with its arms, and trying to bite him with its parrot-like beak.—*Natural History and Fishery of the Sperm Whale*.

POULTICE. See CATAPLASM.

POULTRY (Fr. *poule*, a hen), a collective name for useful domesticated birds. It is sometimes limited to the domesticated gallinaceous birds, but its ordinary use includes all the birds reared for economical purposes. These belong exclusively to two orders of birds, the *Gallinaceous* and *Palmiped*; the common fowl, pea-fowl, Guinea-fowl, turkey, guan, and pigeon belonging to the former; and the different kinds of duck and goose, as well as the swan, to the latter. For what relates to the different species and their varieties, we refer to these heads; devoting this article to some general remarks as to the management of poultry.

In general, the rearing of poultry is regarded as a very subordinate branch of rural economy, and it is pursued chiefly where agriculture is in a somewhat primitive state, the skilful and enterprising farmer deeming it beneath his attention, or finding that he has not time to attend to it, and often looking on the feathered inmates of his farm-yard almost as a nuisance because of their invasions of his fields. It may pretty safely be asserted that there is no good

reason for this, and that poultry properly cared for would always be found a source of profit. The farm-yard affords great advantages for the keeping of poultry, and the increasing demand of the market promises a sure return. In some parts of Britain and in Ireland, where the farms are small, poultry are very extensively kept by farmers and cottagers; but the north of France and Pomerania exceed all other parts of Europe in poultry-keeping, which there is not unfrequently the leading object of husbandry, and the traffic in the products of the poultry-yard is on a truly great scale.

There is very commonly no building erected for the special accommodation of poultry; but perches and places for nests are provided for them in a cow-house or some other farm-building; or, in very many cases, when kept by cottagers, they roost on joists of the roof, within the door of the cottage itself. In such cases, they roam at liberty during the whole day, and find much of their food in the fields and on the road sides, although the feeding of them with corn and other food is not neglected by the careful housewife. But it is often undesirable, for the sake of fields or gardens, that so much liberty should be allowed to poultry, and they may be very advantageously kept either wholly or mostly in confinement. If circumstances permit, it is good for them to be let out for an hour or two daily into a grass field, but it is not necessary, if they are provided with a warm, clean, and well-ventilated house, to which a spacious open court is attached, and are regularly supplied with abundance of food, water, sand, or fine ashes, lime, and small stones, all requisites to their healthful existence. The food must also be of various kinds. Poultry must have supplies of grain or pulse, and of soft food made of the meal of grain or pulse; the kind may depend upon convenience and cheapness; and instead of such food, boiled potatoes may to some extent be used. *Bran* is a very good article of food for poultry. But the same food, without variation, should not be given for any considerable time. And it is indispensable that all kinds of poultry be frequently, if not even daily, supplied with green food, as blades of kale, cabbage, cauliflower, turnips, &c., or lettuces, cresses, chickweed, sow-thistle, &c. It is pretty safe to observe the kinds which they like, and to allow them to choose for themselves. When they have no opportunity of seeking worms, snails, slugs, and insects for themselves, animal food must be given, and the refuse of the kitchen cannot be more profitably employed. It is possible at some seasons to give too much food, making the poultry too fat, and diminishing the production of eggs; but at other times, as during the season of moulting, food

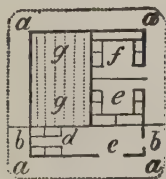

Fig 1 --Plan of Poultry-house. *aa*, the court-yard; *bb*, for ducks and geese, the apartment for which is at *c*, with laying and hatching-nests; *d*, *g*, the roosting-house for hens and turkeys; *e*, the hatching-house; and *f*, the apartment for laying.

Other material, ought to be so firm and hard as to admit of its being easily swept, and this should be often done. The house is provided with roosting-

places on the ground or above it, according to the kind of poultry, and with nests for laying in. Hatching ought to be conducted in a separate place. The court should be furnished with a 'lean-to' shed on one side, under which the birds may find shelter from sun or rain, and here they should find sand or fine ashes to fling over themselves, according to their manner; to rid themselves of insect tormentors. Lime is also necessary for them, large quantities of it being used to make eggshells, besides what the animal system otherwise requires. It may be very conveniently supplied in the form of lime rubbish from old walls, in which also occur in abundance such small stones as birds need in order to the trituration of the food in their gizzard.

In the places appropriated to hatching, it is good to have a fresh turf deposited, to prevent the eggs from becoming too dry, and it is even recommended that the eggs should be slightly moistened every day. It is said that the inner membrane of the egg is otherwise apt to become hard, so that the young chick cannot break through it.

Where purity of breed is of importance, as when fowls are to be exhibited in prize competitions,

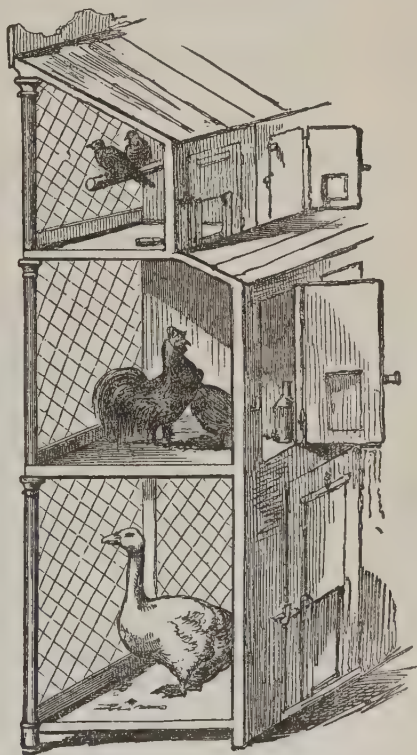

Fig 2 --Poultry-pen.

great care must be taken to keep the different kinds perfectly separate; otherwise, intermixture to a certain extent is not undesirable. It is always, indeed, to be desired that each good kind be kept pure and in as great perfection as possible, for improvement of the stock. But even in a small poultry-house, it is desirable to have different kinds, some being particularly estimable for their flesh, some for the abundance and quality of their eggs, some for their disposition to incubate, &c. For web-footed birds free access to water is required; but some of the

kinds are well enough provided by a pretty capacious trough.

Among the diseases of poultry, *Gapes* (q. v.) is one which very frequently demands attention, particularly in young chickens. *Pip* (q. v.) or *Roup* is another. Some of the maladies which cut off great numbers of young chickens, and still more of turkey-poults, may be in a great measure prevented by supplying abundance of nourishing and sufficiently varied food, with water and lime; and by preventing the young birds, particularly turkeys, from getting among wet grass.

It is sometimes taken for granted by writers on this subject, that all the birds which can be domesticated with advantage, have already been domesticated. The assumption is quite gratuitous, and it might as well be asserted that improvement has reached its utmost in any other direction. The concurrent supposition that the common domesticated kinds were given to man at first as domestic, is likewise unsupported by evidence, although the domestication of some of our poultry birds must be referred to a very early date. Among the *Anatidæ*, some progress has recently been made in the domestication of new kinds; and a beginning may even be said to have been made as to some additional gallinaceous birds.

Much valuable information on the management of poultry will be found in Bement's *Poulterer's Companion*, Tegetmeier's *Poultry Book*, and *The People's Practical Poultry Book*, by D. T. Moore, N. Y., 1871.

POUNCE, powdered rosin, or some gum resin such as mastix, sandarach, or copal, and also the powder of cuttle-fish bones. It is used for sprinkling over freshly-written writing, to prevent blotting; fine sand is often substituted for pounce. Blotting-paper has almost superseded the use of pounce in Great Britain.

POUND, in English Law, means an enclosure, of which there was generally one in every parish, or at least every manor, in which stray cattle were put and detained until the damage done by them was paid for. Whenever a stranger's or neighbour's cattle trespass on another's lands, the latter can seize them, and take them to the pound, or impound them, as it is called, *damage feasant*, and can keep them there till the expenses are repaid. There was a distinction between pound overt, or common pound, and pound covert, or close pound; in the former case, the owner of the beasts could go and feed and water his cattle while impounded, and it was his duty to do so; but not in the latter case. Now, it is compulsory for the impounder, in all cases, to supply the cattle with food, otherwise he incurs a penalty; and if impounded cattle are not sufficiently fed, a stranger who feeds them may not only trespass on lands to do so, but can recover the costs from the owner of the beasts. This was formerly an important head of law, and it is not obsolete, for the power to impound stray cattle still exists, though common pounds are disappearing, for, in point of law, they are not necessary, since the impounder can put the cattle in his own stable or field.

POUND (Sax. *pund*, Ger. *pfund*, Lat. *pondus*, 'weight') the unit of weight in the western and central states of Europe, differing, however, in value in all of them. The symbol (*lb.*), for it is equally general, and is derived from the Latin word *libra*. The old English pound, which is said to have been the standard of weight from the time of William the Conqueror till that of Henry VII., was derived from the weight of 7680 grains of wheat, all taken from the middle of the ear, and well dried. After this time, the *troy* pound, which was heavier by

1/16th than the old English pound, became the standard, but it was divided into only 5760 grains. Henry VIII. introduced the *avoirdupois* pound for weighing butcher meat in the market, and it gradually came to be used for all coarse goods in frequent demand; it contained 7000 troy grains. The troy and avoirdupois pounds, both legal measures, continued in regular use from this period—the former being gradually appropriated by jewellers and apothecaries; and, to prevent variation, a brass weight of one pound troy was constructed in 1758, and placed in charge of the clerk of the House of Commons. This weight, in 1824, was declared by act of parliament to be 'the original and genuine standard measure of weight,' and that from which the value of the ounce, grain, pound avoirdupois, &c. were to be deduced, but being, along with the standards of measure, destroyed in 1834, a commission was appointed to consider the best means of replacing them. After long deliberation, hearing of evidence, and sifting of suggestions, it was agreed, *inter alia*, that the standard of weight should be a piece of platinum, weighing 7000 grains (an avoirdupois pound), but that this piece should not be defined with reference to any natural standard. The troy pound thus ceased to be the standard, but its use was allowed to jewellers and (differently divided and subdivided) to apothecaries.

The pound-weight of silver, a common money standard among the ancient Romans, was introduced by them into the countries they conquered, and thus the term 'pound' became a designation of a certain amount of coined money. Thus, now-a-days, the English pound is considered as something (a coin or otherwise) equivalent to 20 shillings, but originally it denoted the pound of silver which was coined into 20 shillings. From Edward II.'s time, the coins were more and more diminished in size, that monarch coining 25 shillings from a pound of silver; while from the same weight of bullion his various successors coined 30, 45, 48, 96, 144, 288, in the time of Elizabeth 60, and (during the reigns of her successors) 62 shillings. George I. coined 66 shillings to the pound of silver, and this rate still continues, the term 'pound' having been completely severed from its original meaning, and appropriated to signify 20 shillings of the present coinage.

POUNDER, the term used in describing the force of a cannon employed in firing solid shot, as a '9-pounder field gun,' a '300-pounder Armstrong,' &c. See **CALIBRE**.

POUSSIN, NICOLAS, a painter of great celebrity, born near Le Grand-Andely, in Normandy, in 1593 or 1594, was first a pupil of Quintin Varin, then painting pictures for the church of Grand-Andely, but at the age of 18 went to Paris, studied under Ferdinand Elle, the Fleming, Lallemand, and others; but chiefly improved himself by drawing from casts, and drawings and prints after Raphael and Julio Romano, in the collection of M. Courtois, who accorded him access to them. After a long and hard struggle, he attained the object of his desire—namely, the means of visiting Rome. He was 30 years of age when he arrived there, and a considerable period elapsed after that before he obtained much employment. At length, however, he received several important commissions from the Cardinal Barberini, which he executed so successfully, that he afterwards rapidly acquired fame and fortune. After an absence of sixteen years, he returned to Paris with M. de Chantelou, and was introduced by Cardinal Richelieu to Louis XIII., who appointed him his painter in ordinary,

with apartments in the Tuileries, and a salary of £120 a year. P. returned to Rome for the purpose of giving up his establishment there, and taking his wife to Paris; but, while he was occupied with these arrangements, Louis XIII. having died, he gave up all thoughts of returning to his native country, remained in Rome, and after a very successful career, died in 1665. His reputation mainly rests on his success in aiming at the classic style. Sir Joshua Reynolds says: 'No works of any modern have so much the air of antique painting as those of Poussin.' Many prefer his landscapes, or those pictures of his in which the landscape predominates, to his compositions in which his attention has been bestowed chiefly on the figures. Upwards of 200 prints have been engraved from his works. The National Gallery has several of P.'s pictures, two of which are particularly praised, 'A Bacchanalian Dance,' and 'A Bacchanalian Festival.'

POUSSIN, GASPARD, a celebrated landscape painter, was the son of a Frenchman, settled in Rome, and was born there in 1613. He was the pupil of Nicolas Poussin, who had married his sister, and from respect to that great artist, adopted his name in place of his own, which was Dughet. He was called by the Italians Gasparo Duche, and he inscribed his etchings, eight in number, in that way. His landscapes are composed in general from studies in the Campagna of Rome and surrounding country, worked out with the feeling of a mind deeply imbued with classical associations, and tending towards melancholy reflection, by contrasting the glory of the past with the decadence of the present—ideas entirely the opposite of those of Claude, who, trusting to the never-fading beauty of nature, endeavoured, from the scenery and architectural remains in Italy, to realise the classic age in all its glory. The National Gallery possesses six specimens of P., some of them being reckoned masterpieces, as the 'Sacrifice of Isaac,' a 'Land Storm,' and an 'Italian Landscape with a View of a Town.' P. died in Rome 1675.

POW'AN (*Coregonus* [q. v.] *Clupeoides*), a fish found in Loch Lomond, Scotland, and often called *Fresh-water Herring*. It is not found in any other British lake or river, and has not yet been identified with any fish of the continent of Europe, although probably it is to be found in some of the Scandinavian lakes. It resembles the Pollan (q. v.) of the Irish lakes, but is readily distinguished. The P. sometimes attains the length of sixteen inches. Great shoals are seen in Loch Lomond, rippling the surface of the water, and approaching the shores in the mornings and evenings. They are never seen in the middle of the day. The P. is highly esteemed for the table; and is in best condition in August and September. It is generally caught by nets.

POWDERED, or SEMÉE, in Heraldry, strewn with an indefinite number of small charges.

POWELL, THE REV. BADEN, an eminent English savant, son of a London merchant, was born at Stamford Hill, near London, 22d August 1796, and studied at Oriel College, Oxford, where he graduated M. A., with first-class mathematical honours, in 1817. P. took holy orders in 1820, and was appointed vicar of Plumstead, in Kent, in 1821. In 1824, he was elected a Fellow of the Royal Society; and three years later, was appointed Savilian Professor of Geometry, a chair which he held till his death, which took place in London, June 11, 1860. As a professor, his great aim was to bring about a larger recognition of the importance of physical and mathematical science, in the curriculum of learned study at Oxford, and his efforts have not been altogether in vain. To the 'Philosophical

Transactions,' the 'Reports' of the British Association, and other vehicles of scientific instruction, he contributed numerous valuable papers; but is perhaps best known by his strenuous exertions to obtain for modern science the right of modifying the views of nature and the origin of the world, expounded or thought to be expounded in the Jewish Scriptures. In this perilous department of controversy P. displayed great learning, logical power, moderation of tone, and philosophic urbanity; but his conclusions were too unmistakably rationalistic to be palatable to the orthodox. Among his works may be mentioned *A Short Elementary Treatise on Experimental and Mathematical Optics, Designed for the Use of Students* (Oxford, 1833); *Revelation and Science* (Oxford, 1833); *A Historical View of the Progress of the Physical and Mathematical Sciences* (Lond. 1834); *The Connection of Natural and Divine Truth* (Lond. 1833); *Tradition Unveiled; a Candid Inquiry into the Tendency of the Doctrines advocated in the Oxford Tracts; A General and Elementary View of the Undulatory Theory as applied to the Dispersion of Light, &c.* (Lond. 1841); *Essays on the Spirit of the Inductive Philosophy, &c.* (Lond. 1855); *Christianity without Judaism* (1857); *The Order of Nature considered with Reference to the Claims of Revelation* (1859); and *On the Study and Evidences of Christianity in Essays and Reviews* (1860).

POWER, in point of law, means an authority given to some person who would otherwise not be entitled to do the specific thing empowered. Thus an authority given to an agent to act for another is called a power of attorney; and there are numerous examples of powers contained in marriage settlements, wills, and miscellaneous deeds, which authorise one of the parties to do something in certain contingencies. Thus a power of revocation is often reserved to a party to revoke a will or deed. There is a power of appointment given to a married woman or widow to bequeath or divide certain property in certain events among her children. So a power to charge or jointure an estate, and to secure the portions of children. There are many nice and difficult rules of law applicable to matters connected with and arising out of powers. A power is created by a deed or will: and it is said to be executed when it is carried out. In Scotland, powers are generally called *Faculties* (q. v.).

POWERS, HIRAM, American sculptor, son of a farmer, and the eighth of nine children, was born at Woodstock, Vermont, July 29, 1805, and acquired the rudiments of education at a free district-school. While still a boy, he went to Cincinnati, Ohio, where he became an apprentice to a clockmaker, and about the same time formed the acquaintance of a German sculptor, who taught him to model in plaster. Subsequently, he was employed for several years making wax-figures and fitting them with machinery, for the Cincinnati museum, where his 'Infernal Regions' horrified thousands of visitors. In 1835, he went to Washington, where he executed the busts of several distinguished persons; and, with the aid of Mr Nicholas Longworth, in 1837 went to Florence (Italy) to study his art, where he resided until his death. In 1838, he produced his statue of 'Eve,' which excited the admiration of Thorwaldsen; and in 1839, the still more popular 'Greek Slave,' of which six copies in marble, with cast copies innumerable, were produced. Of his 'Fisher Boy,' three copies were ordered. Among his other works the chief have been 'Proserpine,' 'Il Penseroso,' 'California,' 'America' (the last for the Crystal Palace,

Sydenham); statues of Washington for the state of Louisiana, of Calhoun for South Carolina, and Webster for Boston; and busts of Adams, Jackson, Marshall, Van Buren, and other distinguished Americans. Died at Florence June 27, 1873.

POYNTELL, pavement or tiles laid in small lozenge form.

POZZO DI BORGO, CARLO ANDREA, a celebrated Russian diplomatist, was born at Alala in Corsica, March 8th, 1768, and was educated at the university of Pisa. Returning to Corsica, he adopted the profession of advocate, in which he soon became distinguished for his acuteness, ingenuity, and brilliant eloquence; and about this time an intimacy sprung up between him and the two young Bonapartes, Napoleon (I.) and Joseph. P.'s great ability soon gained for him the esteem of Paoli (q. v.), who made him the confidant of his plans, to the intense disgust of the Bonaparte family, who considered themselves slighted. A coolness in consequence sprung up between P. and young Napoleon, which, as their paths in life diverged more and more, passed through the various grades of antagonism, dislike, distrust, and hatred, till, when the latter swayed the sceptre of France, and the former became the supreme trusted adviser of Russia and Austria, it culminated in a deadly struggle for victory between the diplomatist and the warrior, to be ended only by the death of one or the destruction of his power. P. represented Corsica in the French National Assembly (1791—1792); but his party, that which wished to unite liberty and hereditary rule, being overpowered by their 'radical' opponents, he was compelled to return to Corsica, where he again attached himself to Paoli's party; and on the failure of that chief's plans, retired to London. Here he became the agent of the French refugees; and in 1798, having now thoroughly broken with the Bonapartes, he went to Vienna to promote an alliance of Austria and Russia against France, and accompanied the Russian army in the subsequent campaign of 1799. In 1803, he entered the Russian service as a councillor of state, from this time devoting his whole attention to diplomacy. He was at the bottom of the Russo-Austrian alliance, which was dissolved by the battle of Austerlitz (1805); but after the treaty of Tilsit, fearing lest Napoleon might insist upon his surrender, he retired to Austria, from which country Napoleon, in 1809, demanded his extradition. The Emperor Francis refused, but P., to save trouble, retired to England (1810), where he stayed for some time; and then returned to Russia. He soon after induced the Emperor Alexander to make certain custom-house regulations which offended Napoleon, and were a chief cause of the rupture which resulted in the campaign of 1812; he also suggested to the emperor, and effected the seduction of Murat, Bernadotte, and Moreau from the Napoleonic cause; and after the victorious allies had driven Napoleon across the Rhine, P., at the congress of Frankfurt-on-the-Main, drew up his famous declaration, 'that the allies made war not on France, but on Napoleon.' From this time, his whole energies were devoted to the task of keeping Alexander inflexible with regard to Napoleon's seductive offers of accommodation; but after his old antagonist's downfall, he exerted himself with equal vigour at Paris (where he signed the treaty of 1815 as Russian ambassador) and Aix-la-Chapelle (1818) to ameliorate, as much as possible, the hard conditions imposed upon France. After the accession of the Emperor Nicholas, he was, though highly esteemed, less confided in, and accordingly accepted the post of Russian ambassador in London; but retired from

public life in 1839, and settled in Paris, where he died 15th February 1842.

POZZUO'LLI, a city of Southern Italy, at the east of the bay of Naples, with 14,752 inhabitants; it gives name to a sub-prefecture, and has manufactures of soap. But the interest which attaches to it is drawn from its numerous memorials of classic ages. Its cathedral was the Temple of Augustus. There is the Temple of Serapis, an Egyptian god, who was invoked by the priests to render the mineral waters of the place efficacious as remedies. The interior of the temple had a portico of 24 pillars, surrounded by 70 chambers for the sick and for the priests. In the harbour there may still be seen 13 pillars, which formerly supported as many arcades, under which the inhabitants used to congregate to watch for the vessels coming from Africa. There is an arch erected to Antoninus Pius, for having restored 20 of those pillars. There are the remains of an amphitheatre which might have contained 25,000 spectators. The Solfatara (*Forum Vulcani*) is a half-extinct volcano near P., from which springs saline water, used as a remedy for cutaneous diseases. Near the Montenuovo there is the famous Lago d'Averno, enclosed among hills; and at a short distance from it there is the Sibyl's Cave (*La Grotta della Sibilla*), which, however, is nothing more than a subterranean passage from Baja to Averno. On a plain there is an extinct volcano; there Cumæ once stood, now all in ruins. In the environs of P. are to be seen the promontory of Posilipo, the Elysian Fields (*Campi Elisii*) near the harbour of Miseno, and the Lake of Agnano, formerly the crater of a volcano.

P. was probably built by the Cumani (Greek colonists of Cumæ), who gave to its gulf the name of *Cumanus*. They called the new port *De Cæarchia*, a name which was afterwards changed to *Puteoli*, in allusion perhaps to the sulphur wells or springs (*putei*) with which it abounded. Puteoli is first mentioned in history during the Second Punic War, when, by order of the senate, it was surrounded by strong walls. In 214 B. C. it repulsed Hannibal, and from this period rose in importance until, towards the close of the republic, it became virtually the port of Rome, and during the empire was really the first emporium of commerce in Italy. Puteoli was destroyed by Alaric, Genseric, and Totila, and though rebuilt by the Byzantine Greeks, it was exposed to new devastations, to earthquakes, and volcanic eruptions, and soon sank into the decay which continues to mark it.

PRACTICE, in Arithmetic, is the name given to a method, or rather a system of expedients, for shortening or avoiding the operation of compound multiplication. The nature of the expedients will be best understood by an example: Suppose that the price of 64,875 articles at £2, 17s. 6d. is required. It is obvious that the price, at £1, would be £64,875; therefore, at £2, it is £129,750; at 10s., it is the half of that at £1, viz., £32,437, 10s.; at 5s., the half of this last sum, or £16,218, 15s.; and at 2s. 6d., the half of this, or £8109, 7s. 6d. The sum of these partial prices gives the whole price—thus,

	£	s.	d.		£	s.	d.
Price at 2	0	0			129750	0	0
" " 0 10 0	(= 1/2 of £1),				32437	10	0
" " 0 5 0	(= 1/2 of 10s.),				16218	15	0
" " 0 2 6	(= 1/2 of 5s.),				8109	7	6
" " 2 17 6					186515	12	6

The general principle of the method is to decompose the lower decompositions of the compound factor into *aliquot parts* of the higher unit. A

still simpler way with the above example is the following:

£	s.	d.		£	s.	d.
Price at 3	0	0		194625	0	0
" " 0	2	6	(= 1/8 of £1)	8109	7	6
" " 2	17	6		186515	12	6

PRÆFECT, a common name applicable to various Roman functionaries. The most important was the *Præfectus urbi*, or warden of the city, whose office existed at an early period of Roman history, but was revived under Augustus, with new and greatly altered and extended authority, including the whole powers necessary for the maintenance of peace and order in the city, and an extensive jurisdiction civil and criminal. The *Præfectus prætorio* was the commander of the troops that guarded the emperor's person.

PRÆMUNIRÉ, the name given, in English Law, to a species of offence of the nature of a contempt against the sovereign and his government, and punishable with forfeiture and imprisonment. The name is derived from the first words (*præmunire* or *præmonere facias*) of a writ originally introduced for the purpose of repressing papal encroachments on the power of the crown. The first statute of *præmunire* was passed in the reign of Edward I. The attacks of the popes on the rights of private patrons, by bestowing bishoprics, abbacies, &c., on favourites before they were void, were the immediate cause of various subsequent statutes of *præmunire*, which made it penal to endeavour to enforce the authority of papal bulls and provisions in England. By later statutes, a number of offences of a miscellaneous description have been rendered liable to the penalties of a *præmunire*, as (by 6 Anne c. 7) the asserting by preaching, teaching, or advisedly speaking, that any person, other than according to the Acts of Settlement and Union, has any right to the throne of these kingdoms, or that the sovereign and parliament cannot make laws to limit the descent of the crown. The knowingly and wilfully solemnising, assisting, or being present at any marriage forbidden by the Royal Marriage Act, is declared by 12 Geo. III. c. 11 to infer a *præmunire*.

PRÆNĒSTĒ. See **PALESTRINA**.

PRÆTOR (probably a contraction for *prætor*, from *præ-æo*, to precede, also to order) was, among the ancient Romans, the title given to the consuls as leaders of the armies of the state; but it was specially employed to designate a magistrate whose powers were scarcely inferior to those of a consul. The prætorship, in this specific sense of the term, was first instituted in 366 B. C., as a compensation to the patricians for being obliged to share with the plebeians the honours of consulship. It was virtually a third consulship; the prætor was entitled *collega consulibus*; he was elected by the same auspices and at the same comitia. For nearly 30 years, patricians alone were eligible for the office; but, in 337 B. C., the plebeians made good their right to it also. The prætor's functions were chiefly judicial. Though he sometimes commanded armies, and, in the absence of the consuls, exercised consular authority within the city, yet his principal business was the administration of justice both in matters civil and criminal; and 'to the edicts of successive prætors,' says Mr G. Long, 'the Roman law owes, in a great degree, its development and improvement.' Originally, there was only one prætor; but as the city and state increased, and their relations with other nations became more complicated, others were added. In 246 B. C., a second prætor was appointed, to settle disputes

that might arise between Romans and foreigners temporarily resident at Rome, for trading or other purposes, hence called *prætor peregrinus* (foreign prætor), to distinguish him from the original *prætor urbanus* (city prætor). In 227 B. C., two new prætors were appointed, to administrate affairs in Sicily and Sardinia; and in 197 B. C., two more for the Spanish provinces, or six in all. Sulla increased the number to eight, and Julius Cæsar to sixteen. Augustus reduced the number to twelve; but at a later period we read of eighteen, if not more. The city-prætorships were reckoned the highest; and after a person had filled these offices, he sometimes received the administration of a province with the title of *proprætor* or *proconsul*.

PRÆTORIAN BANDS (Lat. *Prætorie Cohortes*, and *Prætoriani*) the name given, more particularly during the period of the Roman empire, to a body of soldiers, organised for the purpose of protecting the person and maintaining the power of the emperors. We indeed read of a *prætorie cohors*, or select guard of the most valiant soldiers attached to the person of Scipio Africanus, who, according to Festus, received six-fold pay, and the exigencies of the civil wars naturally increased their number, but it was to Augustus that the institution of them as a separate force is owing. He formed nine or ten cohorts, each consisting of a thousand men (horse and foot), but kept only three of them in Rome, the rest being dispersed in cities not far off. Tiberius, however, assembled the nine cohorts at the capital in a permanent camp, and Vitellius increased their number to sixteen. The Prætorians served at first for twelve, and afterwards for sixteen years; they received double pay; the privates were held equal in rank to the centurions in the regular army, and on their retirement each received 20,000 sesterces. They soon acquired a dangerous power, which they exercised in the most unscrupulous manner, deposing and elevating emperors at their pleasure. Aspirants for the imperial dignity found it advisable, and even necessary, to bribe them largely; while those who acquired that dignity without their assistance were accustomed on their accession to purchase their favour by liberal donations. The Prætorians, however, had no political or ambitious views; they were simply an insolent and rapacious soldiery, fond of substantial gratifications, and careless how they got them. After the death of Pertinax (193 A. D.), they actually sold 'the purple' for a sum of money to Didius Julianus; but in the same year their peculiar organisation was entirely broken up by Severus, who formed new cohorts altogether out of the best legions serving on the frontiers, which he increased to four times the number of the old. After several other changes, they were entirely abolished by Constantine (312 A. D.), who dispersed them among his regular legions.

PRA'GA. See **WARSAW**.

PRAGMATIC SANCTION, or **RESCRIPT**, a solemn ordinance or decree of the head of a legislature relating either to church or state affairs. The term originated in the Byzantine empire, and signified a public and solemn decree by a prince, as distinguished from the simple rescript, which was a declaration of law in answer to a question propounded by an individual. This name is given to several important treaties, of which the principal are: 1. An ordinance of Charles VII. of France, in which the rights of the Gallican Church were asserted in opposition to the usurpation of the pope in the appointment of bishops. Twenty years later, Louis XI., in order to please Pope Pius II., was induced to give up this P. S., which was ignominiously

dragged through the streets of Rome, but at a subsequent date, a quarrel having arisen between Louis and the pope, the P. S. was re-enacted. 2. The instrument which settled the empire of Germany in the House of Austria (1439 A.D.). 3. The ordinance by which Charles VI., Emperor of Germany, having no male issue, settled his dominions on his daughter, the Archduchess Maria Theresa, which was confirmed by the diet of the empire, and guaranteed by Great Britain, France, the States General, and most of the European powers. 4. The settlement of the succession of the kingdom of Naples, which was ceded by Charles II. of Spain, in 1759, to his third son and his descendants.

PRAGUE (Ger. *Prag*, Slav. *Praha*), capital of the kingdom of Bohemia, is situated in 50° 5' N. lat., and 14° 30' E. long., on the slope of the hills which skirt both sides of the river Moldau, 251 miles north-east of Vienna by railway. Pop. in 1880, 162,318. P., which ranks as the third city of Austria, presents a highly picturesque appearance from the beauty of its site, and the numerous lofty towers (upwards of 70 in number) which rise above the many noble palaces, public buildings, and bridges of the city. It consists of four principal parts: 1. The Kleinsseite, chiefly occupied by the public offices, and the residences of the officials; 2. The Hradschin (or palace district), surmounted by the vast imperial castle, and containing some of the most ancient and interesting churches and palaces of P.; 3. The Jews' Quarter, now known as the Josephstadt, which forms the chief business-quarter, and contains numerous churches, ecclesiastical and educational establishments; 4. The 'New Town,' containing the largest number of streets and open squares, with many modern palaces, charitable institutions, and places of public resort. P. is surrounded by walls and bastions, and has eight gates. The citadel, the ancient residence of the old dukes of Bohemia, is well fortified, and from its elevated position above the Moldau, thoroughly commands the city. P. has 55 Catholic, and 3 Protestant churches, 15 monasteries, and 10 synagogues. Among the most noteworthy of these are the Metropolitan, or St Veits, with its lofty tower, a fine but unfinished specimen of the Gothic of the 14th c., containing the remains of St Ludmilla, first duchess of Bohemia, and of seven kings and emperors of Germany, with the grave of St Wenzelau, and the silver sarcophagus of St Nepomuk (see ST JOHN OF NEPOMUK), a popular saint of Bohemia; St Nicolas, or the church of the Jesuits, with its many towers and costly decorations; the Thein Church, built in 1407; the old Hussite church, with the grave of Tycho Brahe, and its marble monuments of the Slavonic martyrs, Cyril and Methodius. Among the numerous public and other buildings of note in P., the following are some of the more interesting: the Royal Palace, the Cathedral, the Theresa Institution for Ladies, the ancient Byzantine church of St George, the Hradschin Square, with the imposing palaces of the primate, the ex-emperor, and Prince Schwarzenberg; the Loretto Chapel, with its gorgeously bejewelled church vessels; the vast Czerni Palace, now used as an institution of charity; the Picture Gallery; the Præmonstratentian monastery of Strahow; the royal library; and at the summit of the Laurenzberg, the restored Church of St Lawrence. P. has, however, numerous public gardens and walks in the suburbs, which, with the several royal and noble parks open to the public in the vicinity of the city, afford varied resources for health and open air recreations. The suburb of Karolinenthal, which is traversed by the great viaduct

of the railway, and is of modern growth, has some fine buildings, numerous gardens, barracks, and manufacturing establishments; and somewhat further north is the great botanical garden, with the neighbouring public walks on the Moldau. The university, which is the most ancient in Germany, having been founded in 1348, enjoyed the greatest celebrity in the 15th c., when many thousand scholars came from foreign countries to study in its halls. It is now in a state of activity, after a prolonged period of decay, and has good medical and surgical schools; a library containing, in 1851, 109,880 volumes, and 7762 manuscripts, of which some are very rare; a fine observatory; museums of zoology and anatomy; a botanical garden, &c. P. has also 1 polytechnic, 3 gymnasia, Bohemian and German training schools, and about 20 parish schools. The manufactures include leather, cotton, and linen goods, stockings, printed cottons, machinery of various kinds, beet-root sugar, &c. P. is the great centre of the commerce of Bohemia, and the seat of an important transit trade.

History.—According to popular tradition, P. was founded in 722 by the Duchess Libussa. In the 13th c., its importance was fully recognised; in the 14th and 15th centuries, its munificently endowed university brought foreigners to it from every part, until the decision of the Emperor Wenzelau to favour Bohemian students more than others drove thousands of the scholars with their professors to other spots, and led to the foundation of universities at Leipzig, Ingolstadt, Rostock, and Cracow. In 1424, P. was conquered, and almost destroyed by the Hussites, who had made a successful stand against the emperor Sigismund's army; but after the subsequent defeat and submission of the insurgents, the city was rebuilt. In the Thirty Years' War, it suffered severely, and in 1620 the battle was fought at the White Mountain, near the city, in which the Elector-Palatine, Frederick V., known as the Winter King, and son-in-law of James I. of England, was completely defeated, and compelled to renounce his assumed crown, and to give up the town into the power of the emperor. Swedes and Imperialists successively gained possession of it during the war; and a century later, during the Seven Years' War, it again fell into the hands of different victors, having been compelled, in 1744, to capitulate to Frederick the Great of Prussia; and until the war of deliverance in Germany, and the downfall of Napoleon, the city continued to suffer more or less directly from the troubles in which the house of Austria had been involved. During the last fifty years, it has, however, made rapid strides, and enjoyed prosperity and quiet, except in 1848, when the meeting of the Slavonic Congress within its walls called forth such strongly marked democratic demonstrations on the part of the supporters of Panslavism (q. v.), that the Austrian government dissolved the conclave, and restored quiet by the summary method of causing the old and new town to be bombarded for two days.

PRAIA GRANDE. See RIO DE JANEIRO, PROVINCE.

PRAIRIE (Fr. meadow) was the name given, by the early French explorers of the northern portion of the Mississippi Valley, North America, to the vast fertile plains which extend from Western Ohio and Southern Michigan, across the states of Indiana, Illinois, Missouri, Arkansas, Iowa, Kansas, and Nebraska, and Dakota Territory, including the southern portions of Wisconsin and Minnesota. These great plains or savannas are sometimes flat, but oftener rolling like the long swells of the ocean,

and rise in gradual elevation from 300 to 1500 feet above the level of the sea. They are drained by numerous rivers, branches of the Ohio, Mississippi, and Missouri, or emptying into Lake Michigan, whose channels seem to have been worn to the depth of 50 to 300 feet, with vertical walls or bluffs of limestone, sandstone, displaying in some places banks of clay, sand, and loam, 200 feet in thickness. Beneath the prairies north-west of the Ohio are extensive coal-fields, with deposits of iron, lead, &c. The soil is finely comminuted, and sometimes extremely fertile, varying in thickness from one or two feet, to the bottom-lands on the borders of the rivers, which are of great depth and inexhaustible fertility. These plains are destitute of trees, except in isolated groves, a few rocky ridges, and the borders of streams. They are covered with fine grasses, and brilliant flowers of various species of the helianthoid *Compositæ*. Water is found from 15 to 30 feet below the surface. These great prairies, covering an area of about 400,000 square miles, formerly fed vast herds of buffalo, deer, wild turkeys, prairie-hens or grouse, prairie-dog, squirrel, &c. In the autumn, the dried grasses, fired by the Indians, converted them into seas of flame. The lack of timber is attributed to deficiency of precipitated moisture. Remains of ancient mounds, fortifications, and cities shew that they were, at some distant period, inhabited by a more civilised race than the Indians found by European discoverers. These great rolling plains, or natural pastures, with only the labour of ploughing, produce large crops of wheat and maize, and, penetrated by navigable rivers, and crossed by cheaply built railways, they form one of the most easily cultivated and prolific regions of the world, and are capable of sustaining immense populations.

PRAIRIE DOG (*Arctomys Ludovicianus*), a very interesting species of Marmot (q. v.), an inhabitant of some of the western Prairies (q. v.) of North America. It is about the size of a squirrel or large rat; and has soft, reddish-gray fur, each hair being

Prairie Dog (*Arctomys Ludovicianus*).

red, with a white tip. The name P. D. seems to have been given to it from its frequent utterance of a sound somewhat like the bark of a very young puppy. For the same reason, it is also called the Barking Squirrel. A more correct name would be Barking Marmot, or Prairie Marmot. The P. D. does not inhabit the rich grass-covered prairies where the buffalo (bison) abounds; but those which, from want of water, exhibit a comparatively scanty vegetation; and in these it is to be found in vast numbers, being gregarious in its habits, burrowing in the ground, and throwing up mounds of earth, on

the summit of which the little creature often sits as if on watch. The whole extent of a great level prairie is often covered with these hillocks. 'Their number is incredible,' says the Honourable C. A. Murray, in his *Travels in North America*, 'and their cities, for they deserve no less a name, full of activity and bustle.' As soon as the hand is raised to a weapon or missile, they pop into their holes, with amazing rapidity, and then wheel round and look out at the enemy. Still more interesting is the frequent association of the P. D. with the burrowing owl and the rattlesnake in the same burrow; an association which has been variously described as one of strange friendship among very different creatures, in a state of nature; and as of the most opposite character, the owl and the rattlesnake being supposed to prey upon the P. D. and its young. But in so far as the owl is concerned, this is rendered very doubtful by the fact, that its *casts* seem to shew its food to consist entirely of insects. It probably finds the burrows convenient and the inmates harmless.

PRAIRIE-DU-CHIEN. See SUPP. in Vol. X.

PRAIRIE HEN. See GROUSE.

PRAJÂPATI (from *prajâ*, creation, created beings; and *pati*, lord) is, in Hindu Mythology, a name of the god Brahmâ, but also a name of those divine personages who, produced by Brahmâ, created all existing beings, inclusive of gods, demons, and natural phenomena. Manu knows of ten such *Prajâpatis* engendered, through pure meditation, by the god Brahmâ—viz., Marichi, Atri, Angiras, Pulastya, Pulaha, Kratu, Prachetas or Daksha, Vasishtha, Bhrîgu, and Nârada. The Mahâbhârata, however, leaves out Daksha, Bhrîgu, and Nârada; and other varieties occur in the different Purânas. Whereas, also, these 'lords of creation,' in conformity with Manu, are in some of these works looked upon as the mind-born sons of Brahmâ, some Purânas derive them from different parts of Brahmâ's body. The only interesting point in this theory of the *Prajâpatis* is the assumption, that the world did not immediately proceed from Brahmâ, the highest god, but through the intermediate agency of beings which thus stand between him and creation.

PRAJNÂ PÂRAMITÂ (literally, the wisdom which has gone to the other shore, viz., of its object; i. e., absolute or transcendental wisdom, from the Sanscrit *prajñā*, wisdom, *pāram*, to the other shore, and *ita*, gone) is the title of the principal Sûtra (q. v.) of the Mahâyâna school of the Buddhists (see BUDDHISM). Its main object is metaphysical; but the commencement of the work is merely a eulogy of Buddha, and of the Bodhisattvas, who form his retinue. Other parts of it contain incidental narratives of wonderful phenomena connected with the apparition of Buddhist saints, or a description of the benefits arising from an observance of the Buddhistic doctrine, or verses in which the Buddha is praised by his disciples, and similar irrelevant matter. It is probably on account of the extent which could easily be imparted to such episodic topics, but also by amplifying the real substance of the work, that several recensions of the P. are in existence, both with the Buddhists and Tibetans (see LAMAISM); some of these do not contain more than 700 or 8000 or 10,000 s'lokas, or paragraphs; but others amount to 18,000, 25,000, or 100,000 s'lokas. The following may serve as a specimen of the abstruse ideas treated of in this great work of the Buddhistic doctrine. No object has existence or non-existence; nothing belongs to eternity or non-eternity, to pain or pleasure, to vacuity or non-vacuity. All objects are without attributes and with attributes, with and without

uncharacteristic marks. Bodhisattwa (the name for a deified saint) and Prajñā (wisdom) are synonymous terms; such a term neither arises nor perishes; it exists neither inwardly nor outwardly, because it cannot be seized; but the Bodhisattwa must accomplish his career under this fallacious name; it is his duty, however, to look neither upon form nor anything else as an eternal or non-eternal, as a pure or impure matter, &c. Then only when he is in a condition of complete indifference regarding everything, is he capable of encompassing the whole wisdom. . . . The absence of nature is the nature of everything; all objects are separated from their characteristics. All objects neither appear nor are born, nor disappear, nor cease to be, nor are they pure nor impure, nor are they acquirable nor non-acquirable. Want of understanding is the not understanding that objects are nonentities. From the want of understanding proceed all subjective notions; and through the latter one becomes incapacitated from fulfilling the behests of the sacred doctrine, and from entering the path which leads to wisdom. . . . Everything is like the echo, or a shadow, or anything else without substance. In short, the doctrine of the P. is the entire negation of the subject as well as the object; and whatever be the difference in detail between the points of view from which it looks upon subject or object, or between its comparisons and circumlocutions, the result is always the same; that the object of ascertainment, or the highest wisdom, has no more real existence than the subject striving to attain to it, or the Bodhisattwa.—See E. Burnouf, *Introduction à l'Histoire du Bouddhisme Indien* (Paris, 1844); W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St Petersburg, 1860).

PRĀKRIT (from the Sanscrit *prākṛiti*, nature; hence, natural, not accomplished, vulgar) is the collective name of those languages or dialects which are immediately derived from, or stand in an immediate relation to Sanscrit, or 'the accomplished' Language (q. v.) of the Hindus. These languages, however, must not be confounded with those modern languages of India which also have an affinity with the Sanscrit language; for, in the Prākṛit languages, however much they may differ from Sanscrit in their phonetic laws, the words and grammatical forms are immediately derived from that language; whereas, in the modern tongues of India, there is not only no connection between their phonetic laws and those of Sanscrit, but their grammatical forms also are wholly different from those of the ancient language; and while many of their words have no Sanscrit origin, even those which have, shew that they are not immediately drawn from that source. The Prākṛit languages comprise, besides the *Pāli* (q. v.), which generally, however, is not included amongst them, those dialects which are found in the dramas and in the oldest inscriptions. In the dramas, it is women, except female religious characters, and subordinate male personages, who are made to speak in these languages—the use of Sanscrit being reserved for the higher characters of the play—and amongst the former, again, the choice of the special Prākṛit dialect is adapted by the poet to the rank which such a subordinate personage holds, the more refined dialect being appropriated, for instance, to the wives of the king or hero of the play; an inferior Prākṛit to his ministers; others less in degree to the sons of the ministers, soldiers, town-people, and the like; down to the lowest Prākṛit, which is spoken only by servants, or the lowest classes. A work on the poetical art, the *Sāhityadarpana*, enumerates 14 such Prākṛit dialects—viz., the *Sauraseni*, *Māhārāṣṭrī*, *Māgadhī*,

Ardhamāgadhī, *Prāchyā*, *Avantīkā*, *Dākṣiṇ'āṭyā*, *Sākavṛī*, *Bāhlikā*, *Drāvidī*, *Abhīrī*, *Chāṇ'dālī*, *S'ābartī*, and *Paisācī*; but Vāraruchi, the oldest known grammarian of the Prākṛit dialects, knows but four—viz., the *Māhārāṣṭrī*, *Sauraseni*, *Māgadhī*, and *Paisācī*; and Lassen, in the *Indische Alterthumskunde*, holds that, of those, only the *Sauraseni* and the *Māgadhī* have a really local character—the former, as he assumes, having been the vernacular of a large district of Western, and the latter—which is also the Prākṛit in the inscriptions of King Asoka—of Eastern India; whereas the *Māhārāṣṭrī*, or the language of the Mahrattas, does not seem to have been the language of the country the name of which it bears; and the *Paisācī*, or the language of the Pisācha, is obviously merely a fancy name. The principal Prākṛit dialect is the *Māhārāṣṭrī*; the lowest, according to some, the *Paisācī*, of which two varieties are mentioned; but according to others, the *Apabhramśa*—which word originally means 'a falling-off'—i. e., a dialect which completely deviates from the grammatical laws of Sanscrit, but in this special application would designate a dialect even inferior to the *Paisācī*, and is compared by a grammarian to the language of the reptiles. On the grammar of the Prākṛit languages, see Chr. Lassen, *Institutiones Linguae Pracriticae* (Bonn, 1837). The Sūtras, or grammatical rules of Vāraruchi, have been edited in the same work; but more elaborately, with a commentary, copious notes, an English translation, appendices, and an index, by Edward Byles Cowell, who has also added to this excellent edition, *An Easy Introduction to Prākṛit Grammar* (Hertford, 1854).

PRASE, a green variety of Quartz (q. v.), sometimes found crystallised in the same forms as common quartz, but more generally massive, or in prismatic and granular concretions. It is rather a rare mineral. It is sometimes cut as an ornamental stone, but is not highly esteemed.

PRATIQUE is, strictly, a limited quarantine. A ship is said to have performed pratique when her captain has convinced the authorities of a port that his ship is free from contagious disease; and he is thereupon permitted to open trade and communication with the shore.

PRAWN (*Palæmon*), a genus of crustaceans, of the order *Decapoda*, and sub-order *Macrourea*, in general form resembling lobsters, crayfish, and shrimps, but belonging to a family (*Palæmonidae*) remarkable for a long serrated beak projecting from the carapace. The upper antennæ are terminated by three filaments. There are many species of P., and some of those which inhabit the seas of warm climates attain a large size. Many of them are semi-transparent, and exhibit very fine colours; they are also very active creatures, and most interesting inmates of an aquarium, but are excessively voracious, and apt to make great havoc among its other inhabitants. The Common P. (*P. serratus*) attains a length of three or four inches. It is common on the British coasts, although not so abundant as the shrimp, and is generally taken in the vicinity of rocks at a little distance from the shore, and not in rock-pools. It is more esteemed for the table than even the shrimp. Osier-baskets, similar to those employed for catching lobsters, are employed for the capture of prawns; also nets about five or six feet wide, which are pushed along by means of poles, and are called *Putting Nets*. One side of the thorax of a P. is often found remarkably distended. This is owing to a parasitic crustacean, *Bopyrus crangorum*, one of the *Isopoda*, lodged under the carapace.

PRAXITELÉS, a celebrated sculptor of ancient Greece, of whose life nothing is known, except that he was a citizen of Athens, and lived in the 4th c. B. C. Pliny gives the date 364 B. C. apparently as that in which P. began to flourish. His principal works—all of which have now perished—were: 1. Statues of Aphrodite (at Cos, Cnidus, Thespiae, Latmian Alexandria, and Rome), of which that of Cnidus was the most famous; 2. Statues of Eros (at Thespiae, and Parium on the Propontis); 3. Statues, single and in groups, from the mythology of Dionysus (at Elis, Athens, Megara, and other places); 4. Statues of Apollo, the best of which was that representing Apollo as the Lizard-slayer. So far as we are entitled to form an opinion of the works of P. from the descriptions and criticisms of ancient writers, it would seem that they marked an epoch in the history of Greece—viz., the transition from the earnest, heroic, and reverential age preceding the Peloponnesian war, to the more corrupt and sensual times that followed it. The sculpture of Pheidias is inspired by a profound veneration for the majesty of the gods; that of P. sought to give expression to the looser and less divine conceptions of the national religion. The bewitching beauty of woman, and the intoxication of Bacchic pleasures, were his favourite subjects; but in his treatment of these, he displayed unrivalled sweetness, grace, and naturalness. His gods and goddesses were not very divine, but they were ideal figures of the fairest earthly loveliness.

PRAYER is a universally acknowledged part of the worship due to God; a simple and natural expression of dependence, which seems almost necessarily to follow from a belief in the existence of a god. Accordingly, we find it both where the object of worship is one Supreme Being and in systems of polytheism. It is also combined with every other part of worship. According to the Christian system, however, prayer is not the mere spontaneous approach of man to God, in the endeavour to appease his wrath, to win his favour, or to obtain from him any blessing; but the right to approach him in prayer, and the warrant to expect advantage in doing so, rest on the revelation of his own will. Nor is any truth more indisputably taught in the Bible, or more frequently brought into view, both in the Old and in the New Testament, than that God is the *hearer* of prayer.

But a difficulty presents itself, in respect to what may be called the theory of prayer. How can prayer be supposed to influence the divine mind or will? How can a belief in its power be reconciled with any view of the divine decrees, from the most absolute doctrine of predestination to the most modified scheme which recognises the Creator as supreme in the universe? Such questions bring up the same difficulty which attends all other questions of the relations between the human will and the divine, the freedom of man and the sovereignty of God. But whatever seeming inconsistencies may be implied in speculation concerning them, the necessity of prayer and the power of prayer are acknowledged equally by men of the most opposite views; and generally with an acknowledgment of the inability of the human mind to solve some of the problems which are thus presented to it. The extreme predestinarian includes prayer among the means decreed of God along with the end to which it contributes. And whilst prayer is regarded by all Christians as of great value in its reflex influence on the feelings of the worshipper, this is scarcely ever stated as its whole value; however important this view of it may be deemed as illustrating the divine wisdom in making it one of the chief 'means of grace.'

Prayer being regarded by Christians as an *ordinance* of God, it follows that they must seek to be guided in prayer by the rules of his revealed will, in so far as his will has been revealed. It is therefore held by Christians in general, in accordance with their doctrine of the Atonement (q. v.) and of the Intercession (q. v.) of Jesus Christ, that the only true way of access to God is through the mediation of Jesus Christ, and that prayer must be made in the exercise of faith in him; the worshipper taking his stand upon the ground of the obedience or 'finished work and accepted sacrifice' of Christ, and looking up to Christ as now interceding in Heaven. It is also held, in accordance with the doctrine of man's corruption, that prayer can be truly made, in faith, and for things agreeable to God's will, only by the help of the Holy Spirit. Prayer, to be acceptable, must be for things agreeable to God's will, as that will is revealed in his Word; and therefore prayer for mere temporal or earthly good must be made in entire submission to his will; but prayer may be thus made for temporal or earthly good, the will of God having been revealed to that effect—an admirable instance of the grace of God.

Adoration, thanksgiving, and confession of sins, the accompaniments or adjuncts of prayer, are very generally regarded as parts of prayer; and prayer, which is strictly mere *petition*, is defined accordingly.

The Protestant churches all hold that prayer is to be made to God alone; the mediation of Jesus Christ and the help of the Holy Ghost being duly acknowledged. But in the Roman Catholic Church, and to some extent in the oriental churches, prayer of a kind is made also to saints, the Virgin Mary, and angels. See **INVOCATION**.

Prayer, according to Christians in general, must be made not merely in form or words, but with the heart. Accordingly, Protestants hold that prayer ought to be conducted in a language known to the worshippers. The Church of Rome has, on the contrary, maintained the general use of the Latin language, where that language is unknown to most of the worshippers.

Prayer for the dead (see following article) is rejected by Protestants, as having no warrant in the Word of God. But according to the Protestant creed, prayer is to be made for all the living—not only for believers but for unbelievers.

PRAYER FOR THE DEAD, the practice which prevails in the Roman Catholic, Greek, and other oriental churches, of praying for the souls of the deceased, with the intention and expectation of obtaining for them an alleviation of their supposed sufferings after death, on account of venial sins, or of the penalty of mortal sins, remitted but not fully atoned for during life. The practice of praying for the dead supposes the doctrine of **PURGATORY** (q. v.), although perhaps the converse is not necessarily true. Practically, however, the two may be regarded as forming part of one and the same theory, and especially if taken in connection with the doctrine of the Communion of Saints. It being once supposed, as the Roman Catholic system supposes, that relations subsist between the two worlds, that their members may mutually assist each other, it is almost a necessary consequence of the doctrine of purgatory, that the living ought to pray for the relief of their suffering brethren beyond the grave. We can but present an outline of this doctrine and of its history. It seems certain that some such doctrine existed in most of the ancient religions, and especially in those of Egypt, India, and China. It gives significance to many of the practices of the Greeks and Romans in reference to their dead. Its existence among the Jews is attested by the well-known assurance in 2d Maccabees, chap

xii., that 'it is a holy and wholesome thought to pray for the dead, that they may be loosed from their sins.' The continued maintenance of the practice among the Jewish race, is plain from their sacred books; and a still more interesting evidence of its use has recently been discovered in the inscriptions disinterred in several Jewish catacombs of the first three centuries, at Rome and in Southern Italy, which abound with supplications: 'May thy sleep be in peace!' 'Mayest thou sleep in peace!' 'Thy sleep be with the good!' or 'with the just!' &c. Roman Catholics contend that the doctrine, as well as the practice, is equally recognisable in the early Christian Church. They rely on the parable of Lazarus and the rich man (Luke xvi. 19—31) as establishing the intercommunion of this earth with the world beyond the grave; and on Matt. xii. 32, as proving the remissibility of sin or of punishment after death; as well as on 1st Cor. xv. 29, as attesting the actual practice, among the first Christians, of performing or undergoing certain ministrations in behalf of the dead. The Fathers of the 2d, 3d, and still more of the 4th and following centuries, frequently allude to such prayers, as Clement of Alexandria, Tertullian, St Cyprian, and especially St John Chrysostom, Cyril of Jerusalem, and St Augustine. The liturgies, too, of all the rites without exception contain prayers for the dead; and the sepulchral inscriptions from the catacombs, which reach in their range from the 1st till the 5th c., contain frequent prayers in even greater variety, and more directly intercessory, or rather more directly implying release from suffering than those of the contemporary Jews. In the services of the mediæval and later church, prayers for the dead form a prominent and striking element. See REQUIEM. The Abyssinians have separate services for the dead of all the several conditions and degrees in life, and continue to offer the mass daily for forty days after the death. The Protestant churches without exception have repudiated the practice. In the Burial Service of the first Book of Common Prayer, authorised in the Church of England, some prayers for the deceased were retained; but they were expunged from the second Book; and no trace is to be found in that sanctioned under Elizabeth.

PRE-ADAMITES, supposed inhabitants of the earth anterior to Adam. The author of the opinion, or at least the writer in whose hands it first took a scientific form, was Isaac de la Peyrère, better known by his Latinised name *Pererius*. He was born of a Calvinist family of Bordeaux in 1594, and was attached to the service of the Prince of Condé. His theory was first made public in 1655, in the form of a commentary on the 12th, 13th, and 14th verses of the 5th chapter of St Paul's Epistle to the Romans, which was followed, in the same year, by the first part of a formal treatise on the Pre-adamite hypothesis, and the theological consequences to be derived therefrom. According to his hypothesis, Adam was the progenitor of the Jewish race only, and it is only of him and his race that the Bible is designed to supply the history. Other races existed on earth before that of Adam; but of them the Bible contains no record, nor did the Mosaic law regard them or impose any obligation upon them. It was only under the gospel that they began to be comprehended in the law, which through Christ was given to all the human races of the earth; and it is in this sense that, according to Peyrère, sin is said (Rom. v. 13), to 'have been in the world until the law,' but not to have been 'imputed when the law was not.' For the Pre-adamite race, as the law was not, there was no legal offence. The only evil which Peyrère recognised was natural evil. The same limited interpretation he extended to most other

details of the Mosaic history. Thus, he regarded the deuge as partial, being confined only to the Adamite race. Other miraculous narratives of the Pentateuch and even of other books he restricted similarly. As his book was published in the Low Countries, he fell under the animadversion of the Inquisition, and eventually was arrested in the diocese of Mechlin, but was released at the instance of the Prince of Condé. He afterwards went to Rome, where he conformed to the Catholic religion, and made a full retraction of his erroneous opinions. He was offered preferment by the pope, Alexander VII., but returned in preference to Paris, where he entered the seminary of Notre Dame des Vertus, in which he resided till his death in 1676. The discussion has acquired new interest by recent discoveries of supposed evidences of human art and industry, in positions which, considered geologically, appear to their discoverers to be of an age beyond those limits which the Mosaic chronology assigns to the creation of Adam.

PREBEND (Lat. *præbenda*, from *præbere*, to furnish), the income or other provision assigned for the maintenance of a so-called prebendary, out of the revenue of a cathedral or collegiate church. After the definite constitution of chapters for the maintenance of the daily religious services in the bishop's church, or in other churches similarly established, endowments were assigned to them, which were to be distributed (*præbendæ*) in fixed proportions among the members. These portions were called *portiones canonice* or *præbendæ*. To the prebend was commonly attached a residence. The person enjoying a prebend is called a prebendary.—The name prebend is also given to an endowment assigned to a cathedral church for the maintenance of a secular priest.

PRECEDENCE, the order in which individuals are entitled to follow one another in a state procession or on other public occasions. We find questions of precedence arising in very early ages both in Europe and in the East. Where such questions have arisen among ambassadors, as the representatives of different countries, great tenacity has often been shewn in supporting the claims to rank of the states represented. In England, the order of precedence depends partly on the statute 31 Henry VIII. c. 10, partly on subsequent statutes, royal letters patent, and ancient usages. Among questions of precedence depending on usage, there are some which can hardly be considered so settled as to be matter of right, and are in a great degree left to the discretion of the officers of the crown. Formerly, they were adjudicated on by the Constable and Marshal in the Court of Chivalry; and since that tribunal has fallen into abeyance, the practice of persons aggrieved in these matters is to petition the crown, which generally refers the disputed question to the officers of arms. In Scotland, the Lyon Court has the direct jurisdiction in all questions of precedence.

It is a general rule of precedence, that persons of the same rank follow according to the order of the creation of that rank; and in the precedence of the English peerage, it has been fixed that the younger sons of each preceding rank take place immediately after the eldest son of the next succeeding rank. Married women and widows take the same rank among each other as their husbands, except such rank be professional or official, and it is an invariable rule that no office gives rank to the wife or children of the holder of it. Unmarried women take the same rank with their eldest brother; the wife of the eldest son, of any degree, however, preceding the sisters of her husband and all other

ladies in the same degree with them. Marriage with an inferior does not take away the precedence which a woman enjoys by birth or creation; with this exception, that the wife of a peer always takes her rank from her husband. The following tables exhibit the precedence of different ranks as recognised in England.

TABLE OF PRECEDENCE AMONG MEN.

The Sovereign.
The Prince of Wales.
Sons of the Sovereign.
Grandsons of the Sovereign.
Brothers of the Sovereign.
Uncles of the Sovereign.
The Sovereign's Brothers' or Sisters' Sons.
H.R.H. Prince Leopold, King of the Belgians.
The Archbishop of Canterbury, Primate of all England.
The Lord High Chancellor, or Lord Keeper.
The Archbishop of York, Primate of England.
The Archbishop of Armagh, Primate of Ireland.
The Archbishop of Dublin.
The Lord High Treasurer.
The Lord President of the Privy Council.
The Lord Privy Seal.
The Lord Great Chamberlain.
The Lord High Constable.
The Earl Marshal.
The Lord High Admiral.
The Lord Steward of Her Majesty's Household.
The Lord Chamberlain of Her Majesty's Household.
Dukes.
Eldest Sons of Dukes of the Blood Royal.
Marquises.
Dukes' Eldest Sons.
Earls.
Younger Sons of Dukes of the Blood Royal.
Marquises' Eldest Sons.
Dukes' Younger Sons.
Viscounts.
Earls' Eldest Sons.
Marquises' Younger Sons.
Bishops of London, Durham, and Winchester.
All other English Bishops according to seniority of Consecration.
Bishops of Meath and Kildare.
All other Irish Bishops according to seniority of Consecration.
Secretaries of State, if of degree of a Baron.
Barons.
The Speaker of the House of Commons.
Commissioners of the Great Seal.
Treasurer of Her Majesty's Household.
Comptroller of Her Majesty's Household.
Master of the Horse.
Vice Chamberlain of Her Majesty's Household.
Secretaries of State, under the degree of Baron.
Viscounts' Eldest Sons.
Earls' Younger Sons.
Barons' Eldest Sons.
Knights of the Garter.
Privy Councillors.
The Chancellor of the Order of the Garter.
The Chancellor of the Exchequer.
The Chancellor of the Duchy of Lancaster.
The Lord Chief Justice of the Queen's Bench.
The Master of the Rolls.
Lord Chief Justice of the Common Pleas.
Lord Chief Baron of the Exchequer.
Lords Justices of the Court of Appeal in Chancery.
Vice-chancellors.
Judges and Barons of the degree of the Coif of the said Courts.
Commissioners of the Court of Bankruptcy.
Bannerets made by the Sovereign under the Royal Standard in open war.
Viscounts' Younger Sons.
Barons' Younger Sons.
Baronets.
Bannerets not made by the Sovereign in person.
Knights of the Thistle.
Knights Grand Crosses of the Bath.
Knights of St Patrick.
Knights Grand Crosses of St Michael and St George.
Knights Commanders of the Bath.
Knights Commanders of St Michael and St George.
Knights Bachelors.
Companions of the Bath.
Cavalieri and Companions of St Michael and St George.
Eldest Sons of the Younger Sons of Peers.
Baronets' Eldest Sons.

Eldest Sons of Knights of the Garter.
Bannerets' Eldest Sons.
Eldest Sons of Knights of the Bath.
Knights' Eldest Sons.
Younger Sons of the Younger Sons of Peers.
Baronets' Younger Sons.
Esquires of the Sovereign's Body.
Gentlemen of the Privy Chamber.
Esquires of the Knights of the Bath.
Esquires by Creation.
Esquires by Office.
Younger Sons of Knights of the Garter.
Younger Sons of Bannerets.
Younger Sons of Knights of the Bath.
Younger Sons of Knights Bachelors.
Gentlemen entitled to bear Arms.
Clergymen, Barristers-at-law, Officers in the Army and Navy, who are all gentlemen, and have their precedency in their respective professions.
Citizens.
Burgesses.

TABLE OF PRECEDENCE AMONG WOMEN.

The Queen.
The Princess of Wales.
Princesses, Daughters of the Sovereign.
Princesses and Duchesses, Wives of the Sovereign's Sons.
Grand-daughters of the Sovereign.
Wives of the Sovereign's Grandsons.
The Sovereign's Sisters.
Wives of the Sovereign's Brothers.
The Sovereign's Aunts.
Wives of the Sovereign's Uncles.
Duchesses.
Wives of the Eldest Sons of Dukes of the Blood Royal.
Daughters of Dukes of the Blood Royal.
Marchionesses.
Wives of the Eldest Sons of Dukes.
Daughters of Dukes.
Countesses.
Wives of the Younger Sons of Dukes of the Blood Royal.
Wives of the Eldest Sons of Marquises.
Daughters of Marquises.
Wives of the Younger Sons of Dukes.
Viscountesses.
Wives of the Eldest Sons of Earls.
Daughters of Earls.
Wives of the Younger Sons of Marquises.
Baronesses.
Wives of the Eldest Sons of Viscounts.
Daughters of Viscounts.
Wives of the Younger Sons of Earls.
Wives of the Eldest Sons of Barons.
Daughters of Barons.
Maid of Honour.
Wives of Knights of the Garter.
Wives of Bannerets.
Wives of the Younger Sons of Viscounts.
Wives of the Younger Sons of Barons.
Wives of Baronets.
Wives of Knights Grand Crosses of the Order of the Bath.
Wives of Knights Grand Crosses of St Michael and St George.
Wives of Knights Commanders of the Order of the Bath.
Wives of Knights Commanders of St Michael and St George.
Wives of Knights Bachelors.
Wives of Companions of the Bath.
Wives of Cavalieri and Companions of St Michael and St George.
Wives of the Eldest Sons of the Younger Sons of Peers.
Daughters of the Younger Sons of Peers.
Wives of the Eldest Sons of Baronets.
Daughters of Baronets.
Wives of the Eldest Sons of Knights of the Garter.
Daughters of Knights of the Garter.
Wives of the Eldest Sons of Bannerets.
Daughters of Bannerets.
Wives of the Eldest Sons of Knights of the Bath.
Daughters of Knights of the Bath.
Wives of the Eldest Sons of Knights Bachelors.
Daughters of Knights Bachelors.
Wives of the Younger Sons of the Younger Sons of Peers.
Wives of the Younger Sons of Baronets.
Wives of Esquires of the Sovereign's Body.
Wives of Esquires to the Knights of the Bath.
Wives of Gentlemen entitled to bear Arms.
Daughters of Esquires entitled to bear Arms, who are Gentlewomen by birth.
Daughters of Gentlemen entitled to bear Arms, who are Gentlewomen by birth.
Wives of Clergymen, Barristers-at-law, Officers in the Army and Navy.
Wives of Citizens.
Wives of Burgesses.

At the coronation of Charles L, the rule of
741

precedency of the nobility of England was introduced in Scotland; and it was arranged that peers of England (or their sons, &c.), of a given degree, should within England take precedence of peers of Scotland of the same degree; and that this precedence should be reversed in Scotland. But by the acts of Union of Scotland and Ireland, the precedence in any given degree of the peerage has been established as follows: 1. Peers of England; 2. Peers of Scotland; 3. Peers of Great Britain; 4. Peers of Ireland; 5. Peers of the United Kingdom, and Peers of Ireland created subsequently to the Irish Union. A similar order is understood to obtain in regard to baronets. The relative ranking of the great officers of the crown in Scotland was thus settled by statute in 1623 and 1661:

Lord Chancellor.
Lord Treasurer.
Archbishop of St Andrews.
Archbishop of Glasgow.
Earls and Viscounts according to their ranks.
Bishops according to their ranks.
Lord Privy Seal, } first of their rank.
Lord Secretary, }
Lord President of the Court of Session.
Lord Register.
Lord Advocate.
Lord Justice Clerk.
Lord Treasurer Depute.
Lords of Session, according to their admission.
Barons and Gentlemen, being Councillors, according to their admission.

The right of the judges of the Court of Session, in Scotland, to precede baronets, has generally been admitted.

There are rules for precedence for the members of different professions, recognised among themselves, but which do not confer general social precedence. Doctors in the universities rank thus: 1. Of Divinity; 2. of Law; 3. of Medicine.

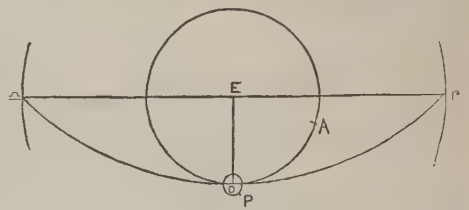

PRECENTOR (Lat. *præ*, before; and *cantor*, a singer), the official in a chapter, whether cathedral or collegiate, whose duty it was to lead the singing. He commenced the psalm or hymn, which was taken up, and repeated either by the celebrant or another of the body, or by the rest of the choir. In modern chapters, the precentor ranks next in dignity to the provost or dean. Among the Presbyterian bodies, the precentor is the official who raises and conducts the psalmody, and is generally provided with a desk immediately beneath the pulpit.

PRECEPT, a legal term, used in Scotch Law in certain departments, generally signifies an order to do something. Thus, a precept of sasine is an order by the superior of lands to his bailie to infest the vassal. A precept of *clare constat* is an order by a superior to infest the vassal's heir, so called because the superior is quite satisfied of the propinquity.

PRECEPTORY, the name given to certain houses of the Knights Templar, the superiors of which were called Knights Preceptor. All the preceptories of a province were subject to a provincial superior, called Grand Preceptor; and there were three of these who held rank above all the rest, the grand preceptors of Jerusalem, Tripolis, and Antioch. Other houses of the order were called 'commanderies.'

PRECESSION. If the earth were truly spherical and homogeneous; or if it were composed of spherical layers each of uniform density; or, more generally, if it were such that the resultant of the attractions exerted on all its parts by any other body should always pass through a definite point in its mass, its diurnal rotation would not be affected by the attraction of any other bodies. If originally rotating about a principal axis of Inertia (q. v.), it

would for ever revolve about it, and the direction of the axis would remain fixed in space. To put this in more popular language, the Pole-star (q. v.) would always be the same star. But, although the earth rotates about an axis almost exactly coinciding with its axis of figure, the attraction of various bodies, especially the sun and moon, on the oblate portion at the equator, tends to give it a rotation about an axis in the plane of the equator; and the combination of these two rotations gives rise to a shifting of the instantaneous axis of rotation in the earth and also in space. As already mentioned (see NUTATION), the earth's axis of revolution describes a waved curve (very nearly circular) about the pole of the ecliptic, and in a direction contrary to that of the order of the signs of the Zodiac (q. v.). This waved curve may be conceived to be described as follows. The pole of the earth, P, revolves in about 19 years in a little ellipse, whose centre, O, travels uniformly in a small circle of the sphere, AO; the centre, E, of the latter is the pole of the ecliptic. The precession is the portion AO of this circle measured from any assumed point, A; and the small arc, OP, by which the true place of the earth's pole differs from its mean place, is the nutation. The nutation is generally resolved along, and perpendicular to, EO; and the components so found are the nutation in ecliptical latitude and longitude. This rough sketch is intended merely to shew the nature of the phenomenon, for the curve described by P about O is only approximately elliptic. Its greatest radius-vector, however, is exceedingly small, amounting only to about eighteen

seconds of arc. AO, also, is not exactly circular, but very nearly so, as its radius, EO, is the obliquity of the Ecliptic (q. v.), which we know varies very little from the angle $23^{\circ} 28'$. The equinoxes, being 90° distant from E, and also from O, which may be taken as the mean place of P, are at \perp and \cap in the diagram. And as O moves round E in the reverse order of the signs, so do the equinoxes, and in the same period—viz., 25,868 years. The effect is, of course, that while the earth's pole describes the small circle, AO, in the heavens, about the pole of the ecliptic, the equinoxes make one complete revolution in the ecliptic against the order of the signs. Thus, in turn, all stars lying near the circle AO become, each for a time, the Pole-star (q. v.). It may seem strange that the term precession should be applied to a retrograde motion; but, from the point of view of the observer, it is evident that the equinox, if on one day it arrive at the meridian of a place simultaneously with a fixed star, will next day arrive at the meridian sooner than the star, or will precede it in time of transit; and this is the origin of the term.

The physical explanation of the cause of precession is almost identical with that of the conical motion of the axis of a top about the vertical; the difference between the two being that, in the case of the top, the conical rotation of the axis takes place in the same direction as the rotation of the top about the axis, while in the case of the earth, the pole of the axis turns about the pole of the

ecliptic in the *opposite* direction to that in which the earth revolves about its axis. But the circumstances of the earth's motion are easily procured by a modification of the spinning-top, such as that of Troughton (used for the determination of latitudes at sea), if the centre of gravity of the whole mass be depressed *below* the point of suspension. If the axis of a top be vertical, there is no precession; similarly, when the sun or moon is in the plane of the equator, no effect is produced by them on the position of the earth's axis. When the axis of the common top is inclined, gravity tends to make it fall over; in similar circumstances, it tends to restore the axis of Troughton's top to the vertical; in either case tending to give the top a rotation about a horizontal axis perpendicular to that about which it is at the instant rotating; and the effect on the top is to cause a slow conical motion of its axis about the vertical. The sun or moon, in like manner, when not in the plane of the equator, tend to make, by their attraction, the earth turn about an axis perpendicular to that about which it is actually rotating. It is the composition of these rotations which gives rise to precession; but, though it would not be difficult to give a satisfactory investigation of the question without using formidable mathematical methods, the length of such an investigation prevents our giving it here. The simplest approximation we can give to the physical explanation, that originally given by Newton, must therefore suffice. We have seen (see PERTURBATIONS) that the node of a satellite's orbit tends always to *regrede* on the plane of relative motion of the primary and the disturbing body. Suppose, for an instant, the protuberant parts of the earth at the equator to be satellites, revolving about a spherical earth. The effect of the sun's or moon's disturbing force upon these satellites would be to make the nodes of their orbits regrede. And exactly the same result will follow if they be attached to the earth, only that the rate of regression will now be much slower, as the whole mass of the earth will share in the motion. This is one of the most ingenious of the wonderful series of explanations of celestial phenomena which were given in the *Principia*.

PRECIOUS STONES, a name almost synonymous with Gems (q. v.) in its widest sense, and partially extended to stones of larger size employed for ornamental purposes, but not to those which are used in architecture.

PRECIPITATION, in Chemistry, is an operation in which decomposition occurs in a fluid, either through the action of the air, or of a gas, or of a chemical agent in solution; and is accompanied by the deposition of a solid substance that was previously held in solution. The substance employed to produce the precipitation is called the *precipitant*, and the substance which is separated by its action, the *precipitate*. For example, if a solution of carbonate of protoxide of iron be exposed to the air, a precipitate of hydrated sesquioxide or peroxide of iron speedily falls; if a current of sulphuretted hydrogen gas be passed through a solution of acetate of lead, a black precipitate of sulphide of lead is thrown down from the clear and colourless solution; and if a solution of corrosive sublimate (bichloride of mercury) be added to a solution of iodide of potassium, a yellow precipitate of biniodide of mercury is thrown down. The precipitant must be added with caution, as, in many cases, an excess of it redissolves the precipitate. In qualitative analyses—that is to say, in determining the presence of substances without reference to their quantity—the colour, solubility, &c., of the precipitate thrown

down by numerous tests, as sulphuretted hydrogen, solutions of nitrate of silver, iodide of potassium, ferrocyanide of potassium, &c., afford the most useful information; and in quantitative analysis, the amount of precipitate thrown down from a given quantity of a solution, is often employed to determine the strength of the latter. For example, if a solution of nitrate of silver is added to an ounce of a solution of hydrocyanic acid of unknown strength, till no further precipitation ensues, we may readily calculate, from the weight of the white precipitate of cyanide of silver, how much anhydrous hydrocyanic acid was present.

PRECOCITY has been regarded as an indication of cerebral disease; and American physicians have not hesitated to identify this manifestation with chronic inflammation of the membranes of the brain. If it is not always, it is often associated with such intense activity of the whole system, and with morbid conditions, such as the scrofulous diathesis, as to usher in actual disease, premature decay, and early death. The decay often consists in mental feebleness and fatuity; or where no such formidable issue follows, in the reduction of what promised to be transcendent genius to commonplace mediocrity. The closing chapters of the history of many wonderful calculators—Infant Rosciuses, Infant Lyras, &c.—illustrate this. It is hence no mere poetic figure to say that the lamp of the mind lives upon and burns itself out. Yet there are numerous exceptions, such as Johnson, Mozart, Fergusson, Davy, where early genius grew into great and masculine powers. This rapid development in infancy or youth of faculties which are generally the result of protracted growth; and the intuitive acquisition of knowledge, which, under ordinary circumstances, is attained by laborious effort and cultivation, are most frequently witnessed in those of feeble and delicate constitution and of stunted frame. It is often seen as a concomitant of rickets, as in Pascal, Pope, &c.; and the dux of the school may often be pointed out from the disproportionate size of his head. While this development includes marvellous exercise of memory, of imagination, of constructive talent, of artistic genius, it rarely extends to judgment, reasoning, and sagacity. There appears to be evidence that this quality is not merely morbid, but that it exercises, reflexly, a detrimental influence upon healthy assimilation and growth, and arrests or retards that building up of the organisation, upon which the ultimate capacity and usefulness of the individual depend. Education sometimes produces such prematurity, or fosters it where it has previously existed; so that the modern form of mental exhaustion, 'the overworked brain,' may be said to originate in the school-room. It is certainly illogical to employ this fact, as has been done, against infant schools; but it is incumbent to keep such a relation in view in all educational efforts; to avoid high pressure and stimulation, to adapt the kind of instruction to the age, and, so far as may be practicable, to the strength and tendencies of the pupils; and to combine systematic physical with all intellectual training.—Brigham, *Remarks on the Influence of Mental Cultivation and Mental Excitement upon Health*; Combe, *On the Management of Infancy*; Caldwell, *Thoughts on Physical Education*.

PRECOGNITION, a Scotch legal term, which denotes the heads or substance of the evidence which a witness in a criminal cause proposes to give at the trial. In all cases, before a trial, it is necessary for the solicitor to see the witnesses and elicit from them the nature of the testimony they can give; and the heads of this testimony are called the

precognitions, when written out. But the word has a technical meaning when applied to the examination of the witnesses before a justice of the peace or the judge-ordinary by the procurator-fiscal, previous to, and by way of enabling him to know how to frame, the charge. On such an occasion, the witnesses are examined or precognosed, a proceeding which corresponds to the evidence given in England before a magistrate or justices of the peace, and called there the depositions.

PREDESTINATION, a theological word, used to denote the eternal decree of God, whereby 'the elect' are foreordained to salvation. The correlative decree, whereby others are held to be foreordained to perdition (though it might with perfect correctness of language be included under the same term), is commonly distinguished by the other term—Reprobation.

The theory of Predestination had, like the doctrine of Election (q. v.), its origin in the attempts of theological system to define the relations of the human and the divine will, and to reconcile the phenomena of human freedom with the belief in divine omnipotence. God's absolute will is represented by it as determining the eternal destiny of man, not according to the foreknown character of those whose fate is so determined, but according to God's own mere choice. They who are thus foreordained to eternal life are led to believe and live by the 'irresistible grace' of the Holy Spirit. In human salvation, therefore, *God's* will is everything; *man's*, nothing. It was in the discussions between Pelagius and Augustine that the Predestinarian view of the divine 'decree' was first fully evolved; and since their time, opinion in the church has run in two great currents—the one perpetuating the influence of Pelagius, who regarded that decree as subordinated to the divine foreknowledge of human character; the other, that of Augustine, who maintained the absolutism of that decree, and its independence of all prior human conditions. Pelagius recognised a possibility of good in human nature; Augustine denied any such possibility, apart from the influences of divine grace. The one held that the choice of salvation lay in man's will; the other, that man's will had no active freedom or power of choice since the fall. In 529, the system of Augustine was established by the Council of Arausio (Orange) as the rule of orthodoxy in the Western Church; but the reaction against the strictly logical yet essentially unmoral nature of his dogma has been perpetually manifested by representatives of the more humane, though perhaps less logical doctrine of Pelagius, in every period of the church. In the days of the schoolmen, the discussions of the Scotists and Thomists—after the Reformation, the contests leading to the condemnation of Arminius in the Council of Dort, and the widening separation that now divides the disciples of Calvin from those theologians who hold broader and freer views on the subject of the *atonement*—indicate the impossibility of the human reason and conscience ever resting satisfied with a merely and absolutely logical theory of the relations between the will of God and the moral responsibility of man. The tendency of modern inquiry seems to be to abandon the discussion of a point so obviously incapable of being determined by human intelligence, and to pursue, instead, examination into the moral and practical bearing upon our human conditions of that which we are able to learn concerning God and His will. The moral meaning of that will is of vital moment to men; the extent of its power over their own wills, they apparently cannot determine.

PRE'DICABLES. This is a term in the

scholastic logic connected with the scheme of classification. There were five designations employed in classifying objects on a systematic plan: *genus*, *species*, *difference* (differentia), *property* (proprium), and *accident* (accidens). The first two—Genus and Species—name the higher and lower classes of the things classified; a Genus comprehends several Species. The other three designations—Difference, Property, Accident—express the attributes that the classification turns upon. The Difference is what distinguishes one species from the other species of the same genus; as, for example, the peculiarities wherein the cat differs from the tiger, lion, and other species of the genus *felis*. The Property expresses a distinction that is not ultimate, but a consequence of some other peculiarity. Thus, 'the use of tools' is a property of man, and not a difference, for it flows from other assignable attributes of his bodily and mental organisation, or from the specific differences that characterise him. The Accident is something not bound up with the nature of the species, but chancing to be present in it. For instance, the high value of gold is an Accident; gold would still be gold though it were plenty and cheap.

It was by an arbitrary and confusing employment of the notion of Predication, that these various items of the first attempt at a process of systematic classification, were called Predicables, or attributes that might be 'predicated,' that is, affirmed, of things. All that is needful to affirm is that a certain thing belongs to a given species or genus; and that to belong to the species is to possess the specific differences; and to belong to the genus is to possess the generic differences. We may also, if we please, *affirm* (or predicate) that the thing does belong to the species, or does possess the specific difference; but this power of affirming has no need to be formally proclaimed, or made the basis of the whole scheme.

The allied term 'Predicament' is another case where an abusive prominence is given to the idea of predication. The Predicaments, or Categories, were the most comprehensive classes of all existing things—under such heads as substance, attribute, quantity, quality, &c.; and it could be predicated of anything falling under any one head that it does so fall under. Thus, 'virtue' is an attribute; and therefore we might say that 'attribute' can be *predicated* of 'virtue.' But the notion of predication does not indicate the main fact of the process in this case, any more than 'predicable' in the foregoing. *Classification*, and not predication, is the ruling idea in each.

PREDICATE. See PROPOSITION.

PRE-ESTABLISHED HARMONY. See LEIBNITZ.

PRE-EXISTENCE, DOCTRINE OF. The notion that human souls were in existence before the generation of the bodies with which they are united in this world, was anciently, and is still, widely spread throughout the East. The Greek philosophers too, especially those who held the doctrine of Transmigration (q. v.), as the Pythagoreans, Empedocles, and even Plato—if with him pre-existence is not simply a symbolical myth—were familiar with the conception. Among the early Christians, the assumption of such pre-existence was connected with the belief, that God had created the souls of men before the world, and that these were united with human bodies at generation or at birth. Subsequently, the followers of this opinion were termed *Pre-existenceists*, to distinguish them from the *Traducianists*, who held that children received soul as well as body from their parents. Direct intellectual

interest in this doctrine has nearly altogether ceased in modern times, yet the dream—for whether true or false, it is and can be nothing but a dream in our present state, and with our present capabilities of knowledge—has again and again haunted individual thinkers. Wordsworth has given poetical expression to it in his famous ode—*Intimations of Immortality from Recollections of Early Childhood*:

Our birth is but a sleep and a forgetting.
The soul that rises with us—our life's star,
Hath had elsewhere its setting,
And cometh from afar.
Not in entire forgetfulness,
And not in utter nakedness,
But trailing clouds of glory do we come
From God, who is our home.

Nor must we overlook the fact, that the latest philosophy of Germany—that of the younger Fichte, has revived the doctrine; while it forms the basis of one of the deepest works in modern theology, that of Julius Müller, *Die Christliche Lehre von der Sünde* (The Christian Doctrine of Sin. English, Edin. 1856).

PRÉFET, the name of an important magistrate in modern France, so called from his exercising functions somewhat similar to those of the *Præfectus urbi* at Rome. See **PRÆFECT**. In old times, the officers whose duty it was to superintend the details of administration in the provinces were called *Maîtres des Requêtes*. Under Henry II., their office was rendered permanent; and at a later period, their powers were much extended, and they were known by the designation of *Intendants*. The intendants were abolished at the Revolution; and a law of 1800 first appointed préfets for the departments, with powers greatly similar to those of the intendants. The office, as it now exists, includes the superintendence of the police establishment, the enforcement of the laws, and the entire control of the administration of the departments. The préfet is the head of the executive, exercises most of the government patronage, including the appointment of a *sous-préfet* for each *arrondissement*, and in time of tumult may call out the military, or provisionally declare a state of siege. The chief check on these extensive powers is to be found in the *Conseil de la Préfecture*, which acts in some measure as a court of appeal from the decisions of the préfet.

PREÛGEL, a river of Prussia, rises in the province of East Prussia, where it is formed by the union of the Pissa and the Angerap near Insterburg. It flows almost due west past Welhau and Königsberg, and after a course of more than 90 miles, enters the Frisches Haff, about six miles below the latter town. The P. is navigable even at Insterburg; and at Königsberg, is 720 feet broad. Its principal tributaries are the Alle from the south, and the Inster from the north. The canal of Deine connects it with the Kurisches Haff.

PREGNANCY, CONCEALMENT OF, is a criminal offence, or rather it is taken to be the main proof of the offence of concealing the birth of a child in certain circumstances. It is only where the child is dead, and has been secretly disposed of under suspicious circumstances, that the mother is punishable. Hence, the offence consists in endeavouring to conceal the birth, and as part of such concealment, to conceal the pregnancy, the child having already died. If the woman failed to give publicity of her situation beforehand, it is presumed this was done from the improper motive, viz., to murder or destroy the child. To complete the offence, it is not necessary that the child should have been born alive; but if the child can be shewn never to have lived, the prisoner must be acquitted. A usual

test of concealment is, that the mother made no preparations for her delivery, nor provided child's clothes.

PREHNITE, a mineral, composed chiefly of silica, alumina, and lime, the silica sometimes about 50 per cent. of the whole; but with small and variable proportions of peroxide of iron, peroxide of manganese, potash, soda, and water. It is a widely-diffused mineral, and although first discovered at the Cape of Good Hope, has been found in great beauty in some places on the continent of Europe and in the United States. P. exhibits a great variety of forms, with considerable variety of colour; being found in crystals in fan-shaped and cockscomb-like groups, granular, reniform, fibrous, &c. It is colourless, or more generally greenish, and sometimes yellowish. See **JADE**.

PRELATE (Lat. *prælat*us, one set over), in Church Law, is the name given to the holders of those higher dignities in the church, to which, of their own right, is attached a proper jurisdiction, not derived by delegation from any superior official. In this sense, the name comprises not only prelates of the first class, as bishops, but also the heads of religious orders, abbots or priors of religious houses, and other similar ecclesiastical dignitaries. These, for the most part, are privileged to wear the insignia of the episcopal rank. In the Roman court, many of the officials, although not possessing episcopal or quasi-episcopal jurisdiction, have the insignia and the title of prelate. They are of two classes—the higher, called *del mantelletto* ('of the little mantle'), and the secondary, called *del mantellone* ('of the great mantle'), from the robe which they respectively bear.

PRELUDE (Lat. *præ*, before, and *ludo*, I play), in Music, a short preface or introduction to a piece, intended to awaken the attention of the audience, generally smooth and flowing, and consisting of a short motive which is kept throughout; or it may be composed of a succession of harmonies uninterrupted or connected by passages. It is in the same key with the piece which it is to introduce, and to which it is intended as a preparation.

PREMISES is a common legal term to signify a house or building, and the outhouses and places belonging to it, all of which are treated as one thing. It is also used to denote a certain part of an English deed, which is further subdivided into the form, date, parties, recitals, testatum, and parcels. The use of the word in this sense is derived from the subject-matter of a conveyance or deed being first stated or described in full, and afterwards referred to collectively as the premises (Lat., *premissa*, things spoken of or rehearsed before).

PREMISS. See **SYLLOGISM**.

PREMONSTRATENSIAN (called also **NORBERTINE**) ORDER, a religious order, which at one time was among the most numerous and powerful of the monastic bodies of Germany, in which country its most important houses were established. It was founded in the early part of the 12th c. by St Norbert, a native of Xanten, in the diocese of Cleves, of which church he was a canon. Struck by the prevailing irregularities and carelessness, not only of secular, but also of conventual life among the clergy and the monks, he resolved on attempting a reform of both, and obtained permission, in 1120, to found a cloister in the diocese of Laon, in France. The place selected by him was a spot in the forest of Concy, pointed out, as he believed, in a vision, and thence called *Pré Montre*, or in Latin, *Pratum Monstratum*, 'the indicated meadow,' from which the name of the order was taken. In accordance with the double object which he

sought to attain, Norbert organised his new order, which was substantially that of the Canons Regular of St Augustine, as well with a view to the sanctification of the members as to their usefulness in effecting the reformation of the age. Himself a man of remarkable piety and austerity of life, his rule is a return to the primitive fervour of the monastic institute; and the great work which he proposed for his brotherhood, in addition to the daily choral services of the church, was the practical instruction of the people, and the direction of consciences in the confessional. It was taken up with ardour, and spread rapidly in France and the Low Countries, and afterwards—on Norbert's being chosen, in 1127, Archbishop of Magdeburg—in Germany; the abbot of the mother-house at Coucy, however, retaining the rank of general and of superior of the entire order. It does not seem at any time to have made much progress, or at least to have established many houses, in Italy or Spain. In the same spirit of reformation, Norbert established an order of nuns, which attained to equal success. In the end of the 15th c., the P. O. had no fewer than 1500 convents of men, and 500 of women, nearly all in France, Germany, and the northern kingdoms. A relaxation of the institute having taken place, in the progress of time there was a movement in the order, towards the close of the 16th c. (1573), similar to that which, in the Franciscan Order (q. v.), led to the reform of the so-called conventual Franciscans; but the reformed communities in the Premonstratensian institute remained united with the older body; and in 1630, the reformed rule was accepted by all in common. The order, however, has gradually fallen in popularity. In France, its numbers had declined very much even before the Revolution. Since that event, it may be said to have disappeared, except in Germany, where (in Austria) some magnificent, though thinly peopled houses of the order are still maintained.

PRENZLOW, a town of Prussia, in the province of Brandenburg, stands on the northern shore of the lower Lake Ucker, 71 miles north-north-east of Berlin. It contains a mineral spring, several baths, and, among its churches, the beautiful Gothic *Marienkirche*, one of the most remarkable brick buildings in the country; date 1325—1340. Population 14,931, who carry on several manufactures, but are chiefly engaged in growing tobacco and corn, and in breeding and trading in cattle. Here, in October 1806, a body of Prussian troops, 16,000 strong, under the Prince of Hohenlohe, surrendered, after the defeat of Jena, to the French under Murat.

PREPOSITIONS are words that express certain relations between ideas—between the idea of an action and the idea of a thing, or between the idea of one thing and the idea of another thing. 'The river runs to the sea. The glass stands on the table. The dog lies under the table. He runs round me. She runs from me. The house by the wood. The house in the wood.' In all the instances just given, the relation is of one kind—that of place or direction. And this was the original signification of all prepositions. They gradually, however, came to express other relations. Thus: 'That depends on you. Subjects are under the sovereign. She got round her father. Vice springs from idleness. Wood is consumed by fire. Your enemy is in your power.' The transition from the palpable, physical relation to the more abstruse mental relation, is, in most cases, obvious.

A preposition is distinguished from an adverb by its always requiring an object (a noun or pronoun)

after it. In the sentence, 'He runs about,' *about* is an adverb describing the mode of running; in 'He runs about the house,' it is a preposition referring the direction of the running to a particular object.

Many relations are expressed by *prepositional phrases*; as, *instead of*, *with regard to*, *apart from*. The preposition *beside* is evidently an abbreviation of such a phrase—*by the side of*. This tendency in phrases to become simple prepositions, is manifest in other cases. Instead of the full expression, 'on this side of the river,' we often hear, 'this side the river,' where *this-side* has the force of a preposition, and may yet come to be written *thiside*.

Of the relations expressed in the modern forms of the Aryan tongues by prepositions, a great many were formerly expressed by cases. See **DECLENSION, INFLECTION, PHILOLOGY.**

Along with prepositions are classed certain particles, which, although they may not stand by themselves and govern a case, are yet used in composition with verbs in the same way as the prepositions proper; as in *outrun*, *replace*.

The simple prepositions (Eng. *in*, Dan. *i*, Lat. *in*, Gr. *en*; Eng. *on*, Gr. and Goth. *ana*, Ger. *an*, Slav. *na*; Eng. *of*, Goth. *af*, O. H. Ger. *aba* or *apa*, Ger. *ab*, Sans. *apa*, Gr. *apo*, Lat. *a*, *ab*; Eng. *by* [be], Goth. *bi*, Ger. *bei*, Gr. *epi*, Sans. *abhi*; &c.) belong to the primary or radical words of language. They are often identical with the pronominal roots (see **PRONOUNS**), and along with them form a class of roots whose primary signification is position or relation in space. All attempts, like those of Tooke, to make them derivatives from verbs, are futile. On the contrary, verbs and other parts of speech are often derived from prepositions, as *utter* from *out*; *open* and *upper* from *up*. Some prepositions have a derivative form, as *after* (from the root of *of*), Lat. *inter* (*in*); others are compounded of two prepositions, or a preposition and prepositional particle, as *upon*, *but* (i. e., by out, or be out), *before*, *within*, *into*. Other prepositions, again, contain a noun, as *against* (A. S. *ongen*, or *tō gegnes*; where, from the forms in the allied languages, the element *gegen* is clearly a substantive, the primary meaning of which, however, has not been made out); *among* (A. S. *gemang* or *ongemang*, *gemang* meaning primarily mixture); *between* (i. e., by or be, two or twain). Such prepositions as *during*, *except*, were originally participles used absolutely; thus, 'during the war' = the war during or lasting, i. e., while the war *dured* or *lasted*; 'except this' = this excepted (*hoc excepto*).

The study of the etymological relations of prepositions is instructive, as shewing how near to one another often lie the most opposed meanings. They are, as it were, the opposite poles of one and the same conception—correlatives depending on a common ground relation, and are thus naturally expressed by words that are radically the same. Thus, Eng. *up* corresponds to Goth. *uf*, Sans. *upa*, Gr. *hypo*, Lat. *sub*. The meaning of *up* is motion from below to above, leaving, however, the idea of the upper terminus the more prominent; *uf*, *hypo*, *sub*, on the contrary, are used to express *under*; but that the notion of upward motion lurked in these roots, is clear from such Latin compounds as *suspicio*, to look up at a thing; *systineo*, to hold up; and it only required a slight modification—a kind of comparison—to convert them into *ufar*, *hyper*, *super*, meaning 'above'—a result which the English attains by adding the preposition *on* (upon). The same principle is copiously exemplified in the numerous forms and derivatives of the prepositional root FR, in Sans., Gr., Lat., and Sl., PR, in which motion or removal from the speaker in the front direction

seems to be the ground idea. For example, when, in reference to any epoch, we speak of the events that have preceded and those that are predicted as to come, the same particle *pre* points in two opposite directions.

PREROGATIVE COURT, in England, was the court wherein all wills were proved, and administrations taken out. It was so called because it belonged to the prerogative of the archbishop to take charge of these matters, which formerly fell under ecclesiastical superintendence. Hence there was a Prerogative Court for the province of Canterbury, and another for the province of York. This jurisdiction was entirely taken away in 1858 from the ecclesiastics, and transferred to a new court called the Probate Court (q. v.).

PRESBURG (Lat. *Posonium*; Magyar, *Pozsony*; Slav. *Pressburek*), a town in the extreme west of Hungary, close upon the frontier of Lower Austria, is built on the left or northern bank of the Danube, 41 miles by railway east of Vienna. The neighbouring hills are clothed with vineyards. It was long the principal city of Hungary, having been made the capital in 1541, when the Turks seized possession of Buda; and even as late as the last quarter of the 18th c., it was the most beautiful, and the most populous town in the kingdom; but when Joseph II., in 1784, restored to Buda its ancient dignity of being the capital of Hungary, and the scene of the coronation of its kings, the sources of the prosperity of P. began to be dried up. Its population, in 1880, was 48,284, of whom more than two-thirds were Roman Catholics; about 7000, Lutherans; and 5000, Jews. Fully one-half of the inhabitants are German, and German is the prevalent language. The most notable buildings in the town are the (Gothic) cathedral, in which the kings of Hungary were crowned; the royal palace, a vast square structure overlooking the town, accidentally burned in 1811, and not since repaired; the Capuchin, Franciscan, and Ursuline monasteries, with beautiful churches attached to them; the Land-Haus (Hall of the Hungarian Diet), &c. The transit-trade by steam-boat and railway, especially in corn, is very great, and gives considerable animation to an otherwise quiet place. P. carries on manufactures of silks, woollens, leather, paper, tobacco, glass, and chemical products. Outside the town lies the 'King's Hill' (*Königshügel*), to which the sovereigns of Hungary were wont to ride after their coronation, and brandish their sword towards the four quarters of the heavens, signifying by that symbolic act that they would defend Hungary from danger—come whence it might. A treaty was concluded here between Napoleon and the Austrian emperor—known as the 'Treaty of Presburg'—December 27, 1805, in virtue of which Austria ceded Venice to France, and the Tyrol to Bavaria.—P. gives name to a 'county.'

PRESBYTER, PRESBYTERIANISM. Presbyter (Gr. *presbyteros*, elder) is the title of an office or dignity in the Jewish synagogue, and also of one of the grades in the Christian hierarchy. In the latter sense, the title has been the occasion of a protracted controversy as to the respective claims of the Bishop (q. v.) and the Presbyter, which, except historically, would be out of place in these pages. The word presbyter not unfrequently occurs in the Epistles and the Acts of the Apostles, and in more than one of these passages, it is certainly applied to persons whose office would seem to be in all respects the same as that which is claimed for the 'bishop' in the episcopalian theory. From this identity of name, the identity of office has been inferred, and it has been hence concluded,

that the distinction of bishops and presbyters is a human and post-apostolic ordinance. Advocates of the episcopal theory admit that the name presbyter is occasionally given, both in Scripture and in the early church writers, to persons who bore the office of bishop (*episcopos*), and that the latter certainly was in all cases a presbyter; but they contend that besides being a presbyter, he was also something more and something higher. That the office of Timothy, for example, was superior to that of a presbyter, is conceived to be plain from St Paul's instruction to him (1st Timothy v. 19) as to how he should receive testimony against a presbyter. The same is inferred from Titus i. 5. On the other hand, no example, it is affirmed, appears of a presbyter sitting in judgment on a bishop, or 'appointing bishops in every city.' But Presbyterians do not admit the validity of these arguments, inasmuch as they assert the identity of presbyter and bishop, and the right of co-presbyters both to judge a brother, and also to ordain to the office of the ministry. Episcopalians rely still more, however, on the apostolic Fathers, and those of the 3d and 4th centuries. Among the Fathers of the former period, Clement of Rome, and even more plainly, Ignatius of Antioch, point to the bishop's superiority as already established, and they are followed by Tertullian, Irenæus, Clement of Alexandria, and Cyprian. On the Presbyterian side, a remarkable passage is quoted from Jerome, in which, while repressing the pretensions of deacons to equality with presbyters, he appears to place the presbyter on the same level with the bishop in all the functions of the ministry except the power of ordination. The explanation of this passage, according to the Episcopalian view, is found in what has been already indicated by the community of name which existed even in the primitive times; while they also rely on the difference implied in the very important exception which even Jerome admits, in this very passage—viz., the power of ordaining. The offices of presbyter and bishop, according to the Roman Catholic theory, both, although in different degrees, belong to what Roman Catholics regard as the priesthood of the New Law. This priesthood the bishop possesses in its fulness, the presbyter only in part, but the functions which belong to that part are discharged alike by the presbyter and the bishop, although by the former only in subordination to the latter. What these functions are, will be detailed under the head **PRIEST** (q. v.); but the principle of a certain distinction of functions, and the limitation of the power of the presbyter as to one at least—that of ordination—is expressly recognised by Jerome in the passage alluded to. The name presbyter has been retained even in the Roman Catholic theory of a priesthood; but although, by the opponents of the Episcopalian doctrine, the word is used with the express design of excluding the sacerdotal idea, it has come, in the popular language of Roman Catholic theology, to be identical with Priest. From an early period, however, a distinction of rank among the presbyters came into use. Several being, in some cases, attached to a single church, one of the number received the title of *proto-presbyter* or *archi-presbyter*; but it is quite certain this office bore no analogy to that of the bishop.

In all existing Presbyterian churches, a primary element is the representation of congregations in presbyteries, &c., by their delegated elders; of whom the 'minister,' or preaching elder, is always one; and this system of representation is advocated partly on the general ground of the unity of the church, and partly on the special ground of the example of the church in the apostolic age (Acts xv.). The affairs of particular congregations are managed

by a court, styled in Scotland the Kirk-session, consisting of the minister, or ministers, if there are more than one, and the other elders, the minister or one of the ministers presiding, but each member having equal power and vote. From the decisions of this court, an appeal lies to the Presbytery, which is usually constituted of the ministers of a certain number of congregations and one 'ruling elder' from each congregation. Further appeals may be taken to *Synods* and *General Assemblies*, in churches so large that for convenience the presbyteries of a district are grouped into a 'Provincial Synod,' and all the provincial synods are subordinated to a General Assembly; but in respect of this there are considerable diversities, and the 'supreme' church court, whether *Synod* or *General Assembly*, is variously constituted by direct representation of each congregation, of each presbytery, or of each provincial synod. Nor are diversities of this kind regarded as in the least degree affecting the principle of Presbyterianism.

Presbyterian churches generally recognise an order of *Deacons* (q. v.) as existing in the church, with power only over its secular affairs; but in many Presbyterian churches this office is merged in that of the elder, and all its functions are exercised by the members of the Kirk-session. A tendency to revive the distinct office of deacon, has, however, been recently manifested in some of the Presbyterian churches.

Some Presbyterians maintain the *divine right of presbytery*, as the one system of church government authorised by the Word of God; others only maintain that Presbyterianism is *consistent* with the Word of God; whilst many Presbyterians maintain that the Presbyterian system, whatever its imperfections as existing anywhere, is, of all systems that have ever existed in the church, the most agreeable to the principles of church government which may be deduced from Scripture.

Presbyterianism, variously modified, is the form of church government subsisting in many Protestant churches, but is most perfectly developed in Britain and America. In Britain, it prevails chiefly in Scotland, although on the revolution in the 17th c., it was for a very short time in the ascendant in England also. The consistorial system of the continent of Europe (see CONSISTORY) cannot, in any of its modifications, be regarded as essentially Presbyterian, although in some respects it approaches to Presbyterianism. The French consistorial system is more nearly Presbyterian than the German, and is not perfectly so only from the pressure of the civil power. In other churches, also, as well as in the Protestant Church of France, Presbyterianism is more or less modified by the relations of the church to the state.

PRESBYTERIAN CHURCH IN AMERICA. The first Presbyterians in America were emigrants from Scotland and Ireland. The first Presbyterian congregations in America were organised in Maryland before the close of the 17th c.—the oldest, that of Snow Hill dating about 1690; and the first presbytery in Philadelphia in 1705. A synod, consisting of four presbyteries, was constituted in 1716. Dissensions ensued; but in 1753 the American Presbyterian churches were united in one; and in 1789 a General Assembly was instituted, the whole number of congregations being then 419, and of ministers 188. The increase of the church was rapid, and in 1834 it contained 22 synods, 111 presbyteries, and about 1900 ministers. In 1801, a scheme of union was adopted between Presbyterians and Congregationalists, under which hundreds of congregations were formed in the state of New York and elsewhere. About the beginning of the present century,

the Cumberland Presbyterians (q. v.) separated from the main body; and in 1838, the American Presbyterian Church was divided into two great sections, commonly known as *Old School* and *New School* Presbyterians; the former holding high Calvinistic doctrines; the latter, a somewhat modified Calvinism. Both of these churches were extended over the whole of the United States, and both of them had missions in different parts of the heathen world, their collections for missions forming a large part of the contributions for that object from the United States of America. The Old and New School Presbyterian churches were reunited in 1869; at that time the former comprised 2381 ministers, 2740 churches, and 258,903 communicants; and the latter, 1848 ministers, 1631 churches, and 172,560 communicants. The Old School Presbyterians possessed the following theological seminaries: 'Princeton' (Princeton, N. J.), 'Western' (Alleghany City, Pa.), 'Hampten-Sidney' (P. Edward Co., Va.), 'Columbia' (Columbia, S. C.), 'Danville' (Danville, Ky.), and 'Northwest' (Chicago, Ill.). The New School Presbyterians held the 'Union' (New York City), 'Auburn' (Auburn, N. Y.), 'Lane' (near Cincinnati, Ohio), 'Blackburn' (Carlinville, Ill.), and 'Lind' (Chicago, Ill.).—Besides the Cumberland Presbyterians, there are other minor branches of the Presbyterian Church in America, connected with different denominations in Scotland.

PRESBYTERIAN CHURCH IN ENGLAND. The principles of the Puritans (q. v.) were essentially Presbyterian, although many of them were so much occupied with questions of doctrine and discipline, and with resistance to power exercised, as they believed, contrary to the word of God, that they paid little heed to the development of their principles in church government. In general, they felt so much the constraint of circumstances, that they refrained even from the attempt to constitute a church on the principles which they maintained, resting satisfied in giving effect to these principles by mere resistance in particular cases in which their consciences were aggrieved. Yet, in 1572, a presbytery was formed at Wandsworth, in Surrey, by ministers of London and its neighbourhood, separating from the Church of England; and other presbyteries were soon formed, notwithstanding the extreme hostility of Queen Elizabeth. When the Westminster Assembly met in 1643, the Puritans of England were generally inclined to adopt Presbyterianism as their system of church government, although some still preferred a modified Episcopacy, and some had adopted the principles of Independence or Congregationalism. The Presbyterians were, however, the strongest party in the beginning of the Revolution, although the Independents gained the ascendancy afterwards. The establishment of Presbyterian church government in the Church of England was voted by parliament (the Long Parliament), 13th October 1647; but it was never really established. The influence of the Independents prevented it. London and its neighbourhood were, meanwhile, formed into twelve presbyteries, constituting the Provincial Synod of London, which continued to hold regular half-yearly meetings till 1655, the meetings of presbyteries being continued till a later date; but the whole Presbyterian system was overturned by Cromwell's Committee of Triers, appointed for the examining and approving of all persons elected or nominated to any ecclesiastical office. Cromwell's policy aimed at bringing all ecclesiastical matters under the immediate control of the civil power. The Restoration was followed by the fruitless Savoy Conference (q. v.), and soon after by the Act of Uniformity, which came into force on 24th August 1662; and on that day, about

2000 ministers in England and Wales resigned their benefices, or submitted to be ejected from them, for conscience' sake. The first Nonconformists (q. v.) were mostly Presbyterians, but a small minority of Independents among them prevented the institution of a regular Presbyterian system, and the consequence was that the Nonconformists of England became in general practically Independent. Antinomianism and Arminianism soon appeared among them, and were followed by Socinianism or Unitarianism to such an extent, that the name *Presbyterian* became synonymous in England with *Socinian* or *Unitarian*; old endowments, legacies of Presbyterians, being in many instances enjoyed by Unitarians. Meanwhile, there existed in England a few congregations connected with the Church of Scotland and with the Scottish Secession Church; and these were formed into *churches*, connected more or less intimately with the Scottish Presbyterian churches, to which other English congregations allied themselves. Of late, the Presbyterians of England have shewn a strong inclination to dissociate themselves from the Presbyterian churches of Scotland, of which they assert a complete independence. This is particularly the case with the 'Synod of the Presbyterian Church in England,' the most intimate relations of which, however, are with the Free Church of Scotland, and which reckons a number of presbyteries in different parts of England, and has a theological college in London, and missions in China and elsewhere.

PRESBYTERIAN CHURCH IN IRELAND. The Irish Presbyterian Church originated in the settlement of Ulster by Scottish colonists during the reign of James I. Scottish ministers carried over to Ireland their peculiar views, and after various struggles, a Presbyterian church was founded by the formation of a presbytery at Carrickfergus on 10th June 1642. The Presbyterian population of Ulster was greatly increased in number by immigration from Scotland about the middle of the 17th c.; and notwithstanding many difficulties, from the opposition of prelates and of the civil power, the church continued to increase. It is a curious fact that the Presbyterian ministers received a pension from government, under Charles II., in 1672, which *Regium Donum* (q. v.), however, was not regularly paid, and soon ceased to be expected by the Presbyterian ministers. In the reign of William, the *Regium Donum* was augmented, although only to the paltry amount in all of £1200 a year. The sum has since, however, been repeatedly augmented, and is now £70 for each minister. A seminary for the education of ministers was also erected at Killaleagh. In 1710, the synod of the Presbyterian Church resolved to institute the preaching of the gospel to the Irish in their own language. During this period of its history, the Irish Presbyterian Church experienced the utmost opposition from the *High Church* party. Afterwards, dissensions sprung up within it, and these with reference to the most important doctrines. A body opposed to the doctrine of the Westminster Confession of Faith was organised as the Presbytery of Antrim. But the Irish Presbyterian Church itself became to a large extent Arian or Unitarian. The *Regium Donum* was augmented in 1792, and again in 1803, and discontinued in 1869, having been valued at 14 years' purchase, and a capital sum paid over therefor. In 1830, a separation took place from the Arians, who then formed the *Remonstrant Synod of Ulster*, Arian views having become very prevalent among the Presbyterians of Ireland. But since that date, the Irish Presbyterian Church has continued to increase, and the Remonstrant or Arian body has

not increased in like proportion. In 1840, a union took place of the Irish Presbyterian Church forming the *Synod of Ulster*, and the *Secession Church in Ireland*, an offshoot of the Scottish Secession Church, which then reckoned 141 congregations in the north of Ireland. The Irish Presbyterian Church now consists of about 600 congregations, and has not only displayed much zeal for the advancement of Protestantism in Ireland, but also of Christianity in other parts of the world, and supports a very successful mission in Guzerat.

PRESBYTERY, the space in the choir of a church in which the high altar is placed; the name is sometimes extended to the whole choir.

PRESBYTERY, in Scotch Law, is an ecclesiastical division of the country, as well as a court. In its local sense, it includes a combination of parishes, varying from four to thirty, and the General Assembly of the Church of Scotland has power to vary the size. See SCOTLAND, CHURCH OF.

PRESCOT, a manufacturing and market-town of Lancashire, 8 miles east of Liverpool. At Huyton, 1½ miles distant, there is a station on the London and North-western Railway. P. has long been well known for its manufactures of watch-tools, watch-movements, small files, &c. Potteries are in operation in the vicinity. Pop. (1851), 7393; 6066; (1871) 5990; (1881) 6418.

PRESCOTT, WILLIAM HICKLING, LL.D., American historian, son of a distinguished lawyer and statesman, and grandson of Colonel William Prescott, an officer of the Revolution, was born at Salem, Massachusetts, on May 4, 1796. He entered Harvard College in 1811, and graduated in 1814. During his college course, he had one eye blinded by a piece of bread playfully thrown by a fellow-student, and his studies so affected the other, that he was sent abroad for his health, and travelled in England, France, and Italy. On his return to America, he married, and abandoned the study of law for literature. In 1819, he determined to devote ten years to study, and the succeeding ten to composition. He contributed, however, several papers to the *North American Review*, collected in his *Miscellanies*. In 1825, he was engaged in the study of Spanish literature, and selected materials for his *History of Ferdinand and Isabella*. While engaged in this work, his sight failed, and, with the aid of a reader who knew no Spanish, he went through the seven quarto volumes of Mariana's *History*. After ten years of painful labour, his work was made ready for the press, and a few copies struck off for his friends, whose warm approval secured its publication in 1837 (3 vols. 8vo, Boston and London). It met with immediate success, and was translated into French, Spanish, and German. He next devoted six years to the *History of the Conquest of Mexico* (3 vols., 1843, London and New York); and four years to the *Conquest of Peru* (2 vols., 1847). These careful, elaborate, and charmingly written works made for him a high reputation. He was chosen corresponding member of the French Institute; and, on his visit to Europe in 1850, he was received with the highest distinction. In 1855, he published two volumes of his *History of Philip II.*, and a third volume in 1858, but left it unfinished. He died at Boston, January 28, 1859. Mr Prescott was an elegant scholar and writer, a man of a cheerful humour and affectionate character, methodical in his habits, and persevering in his pursuits. He walked five miles regularly every day, composing as he walked. He devoted five hours to literary labour, two hours to novel-reading, for the refreshment of his mind—Scott, Dickens, Dumas, and Sue being his favourite authors. He gave one

tenth of his ample income in charity, and divided his time between his winter mansion in Boston, a summer residence at Nahant, and a farmhouse, where he spent the autumn. In his large library, with the light carefully regulated for his imperfect vision, he wrote with a stylus each day what he had composed, which was then copied, read over, and carefully corrected. His life, by George Ticknor, was published in 1864.

PRESCRIPTION is the term applied to the written direction or receipt given by the physician or surgeon to the chemist for the preparation of a medicinal substance suitable to a special case. In prescribing, the medical practitioner may either order an *official* or an *extemporaneous* compound. Official compounds (or preparations, as they are frequently termed) are those for which formulæ are introduced into the national pharmacopœias, and are therefore supposed to be always at hand in the laboratory of the dispensing chemist (such, for example, as *Mistura Ferri Composita*, *Pulvis Ipecacuanhæ Compositus*, *Confectio Aromatica*, &c.); while extemporaneous compounds are those which are devised on the instant with the view of meeting the various peculiarities which almost every case of disease presents. 'Too much importance,' as Dr Paris very truly observes, 'cannot be assigned to the art that thus enables the physician to adapt and graduate a powerful remedy to each particular case by a prompt and accurate prescription. If he prescribes upon truly scientific principles, he will rarely, in the course of his practice, compose two formulæ that shall in every respect be perfectly similar, for the plain reason, that he will never meet with two cases exactly alike.'—*Pharmacologia*, 9th ed., 1843, p. 374.

The author whom we have just quoted, and who is the highest English authority on the subject, lays down five objects which the physician should have in view in the construction of an extemporaneous formula or prescription. They are: 1. To promote the action of the principal medicine (or, as he terms it, the basis) of a formula. 2. To correct the operation of the basis. 3. To obtain the joint operation of two or more medicines which act in totally different ways. 4. To obtain a new and active remedy not afforded by any single substance. 5. To select an eligible form.

The first object may be attained (a) by combining different preparations of the same substance, as, for example, tincture of senna with infusion of senna in the English Black Draught; or (b) by combining different substances of a similar action, as, for example, opium with hyoscyamus or conium; or sulphate of magnesia with the preparations of senna; or quinine with the preparations of iron. The second object may be obtained in various ways. For example, the addition of extract of hyoscyamus to the compound extract of colocynth renders the purgative action of the latter much less griping, but not less efficacious; the addition of dilute sulphuric acid to a solution of sulphate of magnesia renders that purgative salt less liable to gripe, and makes it sit easier on the stomach; and extract of elaterium, if given in hot brandy and water, acts equally powerfully as a hydragogue cathartic without causing the depression of the vital powers, which it often occasions if given alone. As an illustration of a mode of attaining the third object, we may refer to the operation of purgatives and of diuretics. If we administer a purgative which acts mainly in increasing the peristaltic motion of the intestines, their contents will be urged forward and evacuated, but the operation will be slow and difficult, and probably be accompanied with griping; but if we combine this medicine with one which acts by

increasing the flow of fluids into the intestine, the purgative action will be increased and quickened, and all griping will be avoided. A combination of foxglove, squill, and blue pill or calomel will act much more powerfully as a diuretic than any one of the substances taken alone; and they probably all act in different ways on the system. The fourth object is usually attained by chemical decomposition. The activity of the *Mistura Ferri Composita* is due to the carbonate of iron which it contains, and which is yielded by the double decomposition of the two ingredients of the mixture, sulphate of iron and carbonate of potash. By prescribing a mixture of solution of iodide of potassium and corrosive sublimate, we obtain an extemporaneous formation of biniodide of mercury. The Black Wash (see LINTMENTS) owes its active ingredient to the decomposition of calomel by lime-water. In some cases, where no chemical action is apparent or probable, a mixture of two or more drugs seems to modify the physiological effect of each ingredient. For example, Dover's Powder contains as its active ingredients ipecacuanha and opium, and yet in well-regulated doses it neither exhibits the nauseating properties of the former, nor the narcotic influence of the latter substance. The fifth object, the selection of the most eligible form of the remedy, is of extreme importance. The physician here has to determine whether he shall prescribe his remedy in the form of pill, powder, or mixture; whether he shall administer it as an injection into the lower bowel; whether the patient shall (in certain cases) inhale it; &c. As a general rule, we should accommodate the form and flavour of our remedies, provided we do not sacrifice their virtues, to the taste of the patient, who usually prefers pills to draughts or powders. The unpleasant taste of many medicines which must be given in the fluid form may often be obviated by the skill of the prescriber. Castor oil, cod-liver oil, and copaiba are most easily taken on the surface of orange wine, or water containing a bitter tincture, care being taken to moisten with water the edge or rim of the glass at the part applied to the mouth. The taste of solution of potash and of lime-water is best covered with milk; and the disagreeable flavour of senna is said to be concealed if its infusion is made with strong tea.

In conclusion, it may be remarked that in this country it is the custom to write prescriptions in the Latin language, to abbreviate well-known words, to use symbols for weights and measures, and to commence each prescription with the symbol *R*, which signifies *Recipe*, take. As an illustration, we append a prescription for a tonic draught:

(Name of Patient.)

R Infus. Calumbæ, f. ʒiix
Tinct. Calumbæ, f. ʒi
Acid. Sulph. Dilut., ℥x
Syrup. Aurant., f. ʒiiss

M. Fiat Haustus ter quotidie sumendus.

Date (in Latin). (Initials or name of prescriber.)

PREScription, in Law, is the limit of time within which one may acquire certain legal rights, by reason of the want of vindication by some other person of such rights, and putting in force his legal remedies. In England, however, it has a limited meaning, confined to a certain class of rights relating to lands, such as rights of way, of water-course, of fishing, shooting, &c.; while in Scotland, it is a general term, applicable to all legal rights and to real property; and hence prescription in Scotland corresponds to prescription, *plus Limitation* (q. v.), in England. Prescription in England is thus a

mode of acquiring a legal right, incident to land, by the mere force of claiming and exercising it, without dispute, for a certain length of time. Thus, if a neighbouring owner has for 30 years, without interruption, actually enjoyed a right of common, such as pasture, fishery, shooting, &c., over another's lands, he will be entitled to it as a legal right for ever after, unless in certain exceptional cases; and if he has enjoyed it for 60 years, his title for ever after cannot be defeated. So, if a person has for 20 years enjoyed, without interruption, a right of way, or of watercourse, or of watering cattle, and similar Easements (q. v.) on another's lands, he will be entitled, for ever thereafter, to enjoy these, except in a few exceptional cases; and if the enjoyment has been for 40 years, he is entitled in all circumstances. So, if a person whose house adjoins another's lands, and whose windows open upon such land, has enjoyed the light coming to these windows for 20 years, he can for ever thereafter prevent his neighbour from building on his land, and thereby darkening such lights. In Scotland, prescription includes such rights as have been already mentioned, and also the other substantive rights of property. With respect to servitudes, such as right of way, water-course, fuel, feal, and divot, the right can be gained by the enjoyment for 40 years. Prescription is divided into positive and negative. By the positive prescription, whenever one enjoys lands for 40 years, and can shew an infestment, or a series of infestments, during such time, though no previous title at the commencement of such period, such person obtains a right to the property. This enactment applies to all kinds of heritable subjects, including leases and servitudes, which require no infestment, and as to which mere possession for 40 years, without interruption, will give the right. By the negative prescription of 40 years, rights are cut off, unless sued for within that period as a debt due on a heritable bond, and on all contracts whatever. Servitudes are also lost by the lapse of 40 years without enjoyment. Besides these prescriptions, there are others, called the lesser prescriptions. Thus, there is a 20 years' or vicennial prescription, applicable to certain written contracts; a ten years' or decennial prescription, applicable to actions against tutors and curators; a seven years' or septennial prescription, applicable to actions against cautioners; a sexennial or six years' prescription, applicable to actions on bills of exchange; a quinquennial or five years' prescription, applicable to actions for arrears of rent and verbal contracts; a three years' or triennial prescription, applicable to actions on ordinary merchants' accounts, for servants' wages, rent due on a verbal lease, and for work done by workmen, attorneys, &c. With regard to crimes, also, in Scotland but not in England, a 20 years' prescription applies, and no prosecution is competent after that period.

PRESENTATION is the act by which a patron of a living in the Established Church of Scotland appoints a minister; and it is so called because the presentee must be presented to the presbytery for inquiry into his qualifications, and for induction, if these are satisfactory. If the patron fail to present within six months, the right then devolves on the presbytery. When a presentee was objected to by the major part of the congregation, whether with or without reason, the General Assembly of the church formerly claimed the right to declare that he should not be inducted or entitled to the benefice. This declaration was contained in an act of Assembly, dated 1835, called the Veto Act. But after much litigation, it was decided by the courts of law that such Veto Act was *ultra vires* and void; and this decision led to a

secession of many ministers and people from the Established Church, and to the formation of a new dissenting church, called the Free Church (q. v.). The law is now settled that it is the presbytery, and not the people, who are to judge of the reasonableness of any objections made to the presentee, for which purpose, reasons and objections are heard on both sides, and a wide discretion is exercised by the presbytery. If the presbytery dismiss the objections, they then proceed to the trial and Induction (q. v.) of the presentee.

PRESENTMENT is, in English Law, the formal representation made by a grand-jury of the finding of an indictment; by churchwardens to the ordinary of the state of the parish; by the Court of Quarter Sessions of the fact of the disrepair of a bridge, &c. Presentment, with reference to bills of exchange, is the formal demand made by the creditor to the debtor, who is primarily liable, calling upon him to accept the bill or to pay it. If the bill is not paid, then notice of dishonour must be sent to the other parties secondarily liable, who are then bound. See **BILLS OF EXCHANGE**.

PRESERVES, PRESERVED PROVISIONS, &c. Much variety is comprehended under these terms: the first is generally understood to mean fruits preserved with sugar or brandy; and the latter, such articles of animal or vegetable food as are used ordinarily, but which are preserved by any means for the convenience of carriage, and for use beyond the time they would remain uninjured by ordinary keeping. Fruits intended for confectionary are preserved in four different ways: First, They may be preserved in the form of jam, in which the fruit is simply boiled with from one-half to equal its weight of sugar. By this method, the fruit becomes broken, and the juice set free; but all is preserved, as the latter forms a thick syrup with the sugar. Such preserves can be kept, if well made, for several years, but are best used during the first winter. A second plan is to preserve only the juice, which, when carefully strained from the solid portions of the fruit, and boiled with a third or half its weight of refined sugar, constitutes the 'fruit-jellies' of the cooks and confectioners. Another method is called candying, and consists in taking fruits whole or in pieces, and boiling them in a clear syrup previously prepared. In this way, they absorb the syrup, and are then dried by a gentle heat, which causes the sugar of the syrup to crystallise on the surface and through the substance of the preserved fruits, which retain their form, and much, if not all their colour. The remaining method is to carefully stew them in a weak syrup of refined sugar and water, so that they are rendered soft, but are not broken, then transferring them, with the syrup, to jars with well-prepared covers, to prevent evaporation; and adding pale brandy, equal in quantity to the syrup, or the syrup may be strong and the brandy omitted. As a rule, only stone-fruit, such as peaches, plums, and cherries, is preserved in this way. Several fruits and vegetables, such as olives, cucumbers, cabbage, &c., are preserved for food in a saturated solution of salt and water poured in hot; others, in vinegar. See **PICKLES**.

But the most approved methods of preserving vegetable and animal substances for food-purposes, so as to be used as nearly as possible as if they were in the fresh state, is either to desiccate them, or to seal them in air-tight cases. The first method was introduced by M. Chollet of Paris in 1852, and patented in England in 1854. It was, and still is, chiefly applied to vegetables, and a few kinds of fruit, such as apples and pears, which have a small amount of juice. By his method, M. Chollet

entirely removes all moisture from the vegetables, by drying either in a vacuum or by the aid of heated air, which reduces their bulk more than one-half. They are then compressed under powerful presses, which, beside rendering them extremely portable, also makes them less liable to absorb moisture from the atmosphere, which is very desirable, as they are very absorbent. In this way, both the colour and distinctive flavour of the vegetables are completely preserved, and mere soaking in water restores them almost precisely to their original condition. The introduction of this process has been of great benefit to voyagers, as it enables ships to carry a complete supply of vegetable provisions on the longest voyage.

The method of sealing cooked provisions in airtight metallic cases, which is now so largely in use, is of comparatively recent invention, and has only been brought into use during the present century. In 1810, Augustus de Heine took out a patent in Great Britain for preserving food in tin or other metal cases, by simply exhausting the air by means of an air-pump; but it was unsuccessful. It was followed by a number of others by various persons, all of which were more or less failures, until Wertheimer's patents, which were three in number, from 1839 to 1841. By his plan, the provisions of whatever kind are put into the metal cases, and closely packed, and the interstices filled in with water or other appropriate liquid, such as gravy in the case of flesh-food. The lids are then soldered on very securely; two small perforations are made in each lid, and the cases are set in a water-bath, in which muriate of lime is dissolved, and heat is applied until the whole boils, and the air is expelled through the small openings in the lids of the cases. When this is complete, which the operator knows by practice, the small holes are quickly soldered up, and the tins are removed from the bath. The muriate of lime is used because its solution can easily be maintained at a heat of 270° to 280° Fahr., without material evaporation. When required for use, it is usual to put the tin-case in a proper vessel, and cover it with water until it boils. The top is then removed by a knife made for the purpose, and the contents are turned out into a dish ready for the table. Henry Gunter, Stephen Goldner, and others patented plans similar in principle, but varying in the mode of applying it. Latterly, a large business of this kind has been successfully carried on by various British manufacturers, whose cases of preserved meats and soups are well known as an article of commerce. But the plan in use now is that just described. A very ingenious and scientific plan for preserving meat fresh was invented by Professor George Hamilton, of Cheshire. It consists in cutting the meat small, and putting it into jars of binoxide of nitrogen, which perfectly preserves its sweetness and ordinary appearance. A method of preserving vegetables in cans, extensively practiced in America, is by simply boiling them for a proper length of time, and transferring them to the cans or bottles, and sealing immediately.

The *Extractum carnis* (Extract of meat) of Professor Liebig is one of the most valuable of the preparations of preserved food. It is made in South America, where the flesh of cattle, which are killed in masses for the hide and tallow, would otherwise be entirely lost. Forty-five pounds of beef are reduced to one pound of extract, and of this one teaspoonful will make four bowls of soup. This has been largely consumed by the German armies in service, with the happiest results. Flour has been prepared by M. Touaillon, of Paris, a process in which it is desiccated without being altered, and the gluten reduced unfermentably, but recovering its primitive elasticity on being wet.

The production of preserved food has greatly developed since 1865, and is due to a more perfect knowledge of the best processes. See also PRESERVES, PRESERVED PROVISIONS, &c., in SUPPLEMENT in Vol. X.

PRESS, FREEDOM OF THE, the expression used to denote the absence of any authorised official restraint on publication. The press is an instrument well adapted for disturbing the functions of government, and committing injuries against reputation; and when its power as a political engine was first discovered, the European governments took it into their own hands, no one being allowed to print any work till it had obtained the sanction of the proper authorities. The clergy also, on behalf of the papal hierarchy, claimed a share in the censorship, where questions of religion were concerned. In England, at the Reformation, the control of the press came to be more completely centred in the crown than elsewhere, the ecclesiastical in addition to the secular department being vested in Henry VIII, as temporal head of the church. The Company of Stationers, who came to have the sole right to print, were servants of the government, subject to the control of the Star Chamber. The censorship of the press was enforced by the Long Parliament, and was re-established more rigorously at the Restoration. It was continued at the Revolution, and the statute regulating it was renewed from time to time till 1693, when the Commons, by a special vote, struck it out of the list of temporary acts to be continued. Since that time, the censorship of the press has ceased to exist in Britain. But though there are no official restrictions on what shall and what shall not be published, the authors and publishers of criminal or injurious matter are amenable to the law of libel; and there are certain statutory requirements in force to enable them to be traced. The existing statutes which apply to all printed publications are 39 Geo. III. c. 79, amended by 51 Geo. III. c. 65, and 2 and 3 Vict. c. 12. Every person who possesses a printing-press or types for printing, and every typefounder, must give notice to the clerk of the peace. Every person selling types must give an account of all persons to whom they are sold. Every person who prints anything for hire or reward must keep one copy at least of the matter printed, and write on it the name and place of abode of the person who employed him to print it. By statute 2 and 3 Vict. c. 12, every person who shall print any paper meant to be published, must print on the front of the paper, or on the first or last leaf, his name and usual place of business; and on failure to do so, he forfeits the sum of £5, which penalty can, however, be sued for only in name of the Attorney or Solicitor-general, or the Lord Advocate of Scotland. A few exceptions exist to the above requirement in the case of papers printed by parliament or government offices, engravings, auction lists, bank-notes, bills of lading, receipts for money, and a few other instances. The statutes affecting newspapers are 60 Geo. III. and 1 Geo. IV. c. 9, 2 Geo. IV. and 1 Will. IV. c. 73, and 6 and 7 Will. IV. c. 76. The publisher of a newspaper must, under a penalty of £20, enter into a recognisance or bond of £400 or £300, together with sureties to pay any fine that may be adjudged against him for publishing a blasphemous or seditious libel. Before publication, he must furnish the correct title of his newspaper, and the names and addresses of the printer, publisher, and (with certain restrictions) of the proprietors. At the end of every newspaper must be printed the Christian name and surname of the printer and publisher. A copy must also be sent to the Stamp Office, authenticated so that it may be produced in evidence at any trial. The

penalties against newspapers can only be sued for in the name of the Attorney-general or Solicitor-general, or Lord Advocate, or an officer of Inland Revenue. Certain regulations also exist regarding plays, for which see THEATRE. Subject to these restrictions, the freedom of the press has subsisted in Britain since 1693.

A more or less rigorous censorship of the press exists in most European states. There is often no direct supervision previous to publication, but the official censor has it in his power to stop any publication which he deems objectionable, to confiscate the edition, and to prosecute the author and editor. Newspapers and pamphlets are generally subjected to a stricter censorship than larger works.

PRESSING TO DEATH. See PEINE FORTÉ ET DURE.

PRESSIRO'STRES, a tribe of birds of the order *Grallatores*, distinguished by a bill of moderate size, not so strong as in the *Cultrirostris*; whilst the hind toe is either wanting, or so short as not to touch the ground. To this tribe belong bustards, plovers, lapwings, oyster-catchers, &c.

PRESSTI'SSIMO (Ital. very quick) is the most rapid degree of movement known in musical composition.

PRESTER JOHN. See JOHN, PRESTER.

PRE'STO (Ital. quick), in Music, a direction that a piece should be performed in a rapid lively manner.

PRESTON, an important manufacturing and market town, a municipal and parliamentary borough in Lancashire, on the north bank of the Ribble, and at the head of the estuary of that river, 28 miles north-north-east of Liverpool. It occupies an eminence 120 feet above the Ribble, and it covers an area 2 miles square. The houses are mostly built of brick, and the town is on the whole well laid out, and is surrounded with pleasing scenery. The river is crossed by two bridges and a railway viaduct. There are 13 churches and twice that number of Catholic and dissenting chapels; among the other buildings and institutions, the chief are, a free grammar school, founded in 1663, and having an income from endowment of £150 per annum, and numerous other schools, the Institution for the Diffusion of Useful Knowledge, Town-house, Corn Exchange, House of Correction, and court-house. Linen manufactures were formerly the staple, and though still extensive, have been supplanted by the cotton manufacture, which now holds the first place. P. contains in all about 90 cotton-mills, which give employment to about 27,500 hands. There are also iron and brass foundries, iron shipbuilding yards, carriage-works, and machine shops; and malting, brewing, and ropemaking are also carried on. P. is a free port, and is reached at spring-tides by vessels drawing 14 feet. In 1872, 816 vessels, of 42,695 tons, entered and cleared the port. Its imports are chiefly corn, iron, and timber; its exports principally coal. Four great fairs are held here during the year, besides the usual weekly markets. The borough returns two members to the House of Commons.

P., that is, Priest's Town, so-called, probably, from the number of its religious edifices, the remains of some of which are still visible, is of high antiquity. It arose after the decline of Ribchester (the Roman *Rigodunum*), now a village some miles higher up the Ribble. P. was partially destroyed by Bruce in 1322; and after declaring for the king, it was taken by the forces of parliament under General Fairfax. Here also ended the ill-fated Jacobite rising of 1715, when, after a brave resistance,

the insurgents were compelled to surrender. See DEWENTWATER. Pop. (1871) 85,427; (1881) 93,707.

PRESTONPANS, an inconsiderable village of Haddingtonshire, with a station on the North British Railway, 8½ miles east of Edinburgh. Salt-pans are supposed to have been erected here as early as the 12th c., and the village was the seat of thriving manufacturing operations for many years after the Reformation. The only manufacture with which its name is now associated is that of a light bitter beer. In the vicinity, on the 21st September 1745, was fought the famous battle of P., between the royal troops under Sir John Cope, and the Jacobites under Prince Charles, in which the latter, with a loss of only about 10 officers and 120 men in killed and wounded, routed the royal forces with great slaughter, and captured their cannon, baggage, and military chest.

PRESUMPTION is an inference drawn by the law in certain circumstances or conditions of facts, and is used generally as a mere starting-point in an argument or litigation. Presumptions are often divided into *presumptio juris* and *presumptio juris et de jure*. The former serves as a mere starting-point, and may be rebutted by proof to the contrary. Thus, a person who has possession of goods, is presumed to be the owner till the contrary is proved. A man is presumed to be innocent until the contrary is proved. A *presumptio juris et de jure* is said to be a presumption which cannot be rebutted; but there are few instances of this. Presumptions abound in all departments of the law, and are adopted from the necessity of coming to some conclusion or other in most cases where the evidence is general or inconclusive. Thus, a common illustration is where two persons are drowned at sea, and legal rights depend on the fact which of them survived the other. In such a case, it is presumed, by the law of some countries, that the younger person survives; but there is no presumption in England. But in case of mother and child dying during delivery, the presumption is that neither survived. If a person disappear, and is not heard of, he is presumed to be living. But by an act of parliament this presumption was put an end to, or at least was not allowed to interfere with the right of a married woman to consider herself a widow, after her husband has left her, and has not been heard of for seven years.

PRETENCE, ESCUTCHEON OF, or ESCUTCHEON SURTOUT, in Heraldry, a small shield placed in the centre of the field of another shield. The husband of an heiress may bear the arms of his wife in an escutcheon of pretence, instead of impaling them. Feudal arms are also sometimes placed on an escutcheon of pretence, particularly in the insignia of elective sovereigns, who have been in use of bearing their own proper arms in surtout over those of the dominions to which they are entitled. The crown of Charlemagne is placed in surtout in the arms of Hanover; and from 1801 till the accession of Queen Victoria, the Hanoverian insignia occupied an escutcheon of pretence in the centre of the royal arms of the United Kingdom.

PREVOST-PARADOL, LUCIEN ANATOLE, a distinguished French litterateur, born at Paris, 8th August 1829, studied at the Collège Bourbon and the Ecole Normale; and in 1851, obtained from the Académie Française the prize for eloquence, for his *Eloge de Bernardin de Saint-Pierre*. In 1855, he was named to the chair of French Literature by the Faculty of Aix; but in the following year resigned it, and became one of the editors of the *Journal des Débats*, to which he contributed a great number of articles remarkable for their precision and

refinement of thought. His literary and political essays are among the soundest, the most acute, the most scholarly, and the most elegant that have proceeded from the French journalists of the Empire. We may mention in particular his *Du Rôle de la Famille dans l'Éducation* (1857); *Nouveaux Essais de Politique et de Littérature* (1862). In June, 1870, he represented France at Washington, but committed suicide July 20, in the same year.

PRIAM, in Homeric legend, was king of Troy at the time of the Trojan war. His father was named Laomedon, and his mother Strymo or Placia. P. is said to have been originally called *Podarkes* (the Swift-footed), but to have received his later and better-known appellation (from *Priamai*, to ransom) on account of having been ransomed by his sister Hesione from Herakles, into whose hands he had fallen. His first wife was Arisbe, daughter of Merops, whom he gave away to a friend in order to marry Hecuba, by whom, according to Homer, he had nineteen sons; but as his intercourse with the other sex was not limited to Hecuba, the epic poet gives him in all 50 sons; while later writers add as many daughters. The best-known of these are Hector, Paris, Deiphobos, Helenus, Troilus, and Cassandra. P. is represented as too old to take any active part in the Trojan war; and in Homer, only once appears on the field of battle. The oldest Greek legends—i. e., the Homeric, are silent respecting his fate; but the later poets—Euripides, Virgil, &c.—say that he was slain by Pyrrhus at the altar of Zeus Herkeios, when the Greeks stormed the city.

PRICE, RICHARD, was born at Tynton, in Wales, on 22d February 1723. His father, Rice Price, was a dissenting minister, possessed of some wealth, and remarkable for his intolerance. A leading characteristic of his son's mind, on the other hand, was the calm resolution with which, from his youth, he declared his own opinions, and advocated freedom of thought for others. He declined to bend his convictions to paternal authority; accordingly, on his father's death, Richard was so poorly provided for, that, having resolved to prosecute his studies in London, he was obliged to make the journey chiefly on foot. He obtained admission to a dissenting academy, where he acquired a good knowledge of mathematics, philosophy, and theology. At the end of four years, he engaged himself as chaplain to a Mr Streathfield, with whom he lived for thirteen years. Mr Streathfield, on his death, left P. some property; and his circumstances having been further improved by the death of an uncle in 1757, he was enabled to carry out a matrimonial engagement which he had formed with a Miss Blundell.

He then settled as a preacher at Hackney; but being shortly afterwards chosen minister at Newington Green, he removed to that place, where he lived till the death of his wife in 1786, when he returned to Hackney. Meanwhile, his life had been one of considerable literary and scientific activity. His *Review of the Principal Questions and Difficulties in Morals* (Lond. 1758), though a somewhat heavy work, established his reputation as a metaphysician and a moralist. In 1769, the degree of Doctor of Divinity was conferred on him by the university of Glasgow. In the same year, he published his *Treatise on Reversionary Payments*, this was followed by the compilation and publication of the celebrated *Northampton Mortality Tables*, and various other works relating to life-assurance and annuities, forming most valuable contributions to the branch of science to which they refer. In 1776, appeared his *Observations on Civil Liberty and the Justice and Policy of the War with America*. Of this work,

60,000 copies are said to have been sold in a few months. So greatly was it admired in the United States, that, in 1778, the American Congress, through Franklin, communicated to him their desire to consider him a fellow-citizen, and to receive his assistance in regulating their finances; an offer declined principally on the ground of age. He died April 19, 1791. P. was a believer in the immateriality of the soul, holding that it remained in a dormant state between death and resurrection. Their difference of opinion on this subject led to a controversy of some celebrity between him and his friend Dr Priestley. His views respecting the Son of God were what is called Low or semi-Arminian. His moral character appears to have been a singularly beautiful one. 'Simplicity of manners,' says Dr Priestley, 'with such genuine marks of perfect integrity and benevolence, diffused around him a charm which the forms of politeness can but poorly imitate.' See *Memoirs of the Life of Richard Price, D.D.*, by William Morgan, F.R.S., Lond. 1815.

PRICHARD, JAMES COWLES, a distinguished ethnologist and physician, was born at Ross, in Herefordshire, on the 11th of February 1786. His father, Thomas Prichard, a member of the Society of Friends, and a merchant, had been married young, and was early left a widower with four children, upon whose education he bestowed the greatest care. Of these children, James Cowles, the eldest, was educated at home under private tutors. He learned Latin and Greek from a Mr Barnes; French from an *émigré* named De Rosemond; and Italian and Spanish from an Italian named Mordenti—while his father himself taught him history, for the study of which young P. shewed a strong predilection. At Bristol, where his father resided for some time in the pursuit of his business, the embryo ethnologist gave the first indications of his love for the study in which he afterwards became famous. On the quays, he met with foreigners from every country, and took much interest in observing their physical appearance, occasionally conversing with the sailors and others, as well as he was able, in their native tongues. On retiring from business, his father again took up his abode at Ross, where the son continued to pursue his studies under private tutors. When the time for choice of a profession arrived, young P. chose that of medicine as the one he thought most akin to his ethnological pursuits. He accordingly became a student of medicine, first at Bristol, afterwards at St Thomas's Hospital, London, and finally at Edinburgh, where he took his degree of M.D. Before commencing practice, however, he entered himself a student at Trinity College, Cambridge, where he read mathematics and theology for the most part. Subsequently, he studied at St John's College and Trinity College, Oxford. In 1810, he commenced practice in Bristol as a physician. His talents were soon recognised, both privately and publicly. He was first appointed physician to the Clifton Dispensary and St Peter's Hospital, and afterwards physician to the Bristol Infirmary. In 1813, he published his first work, *Researches into the Physical History of Mankind*, which at once gave him a high standing as an ethnologist. Of this, a second and enlarged edition, in two vols., appeared in 1826; and a third, still further improved and enlarged, in five vols., appeared between the years 1836 and 1847. The second and third editions of this work, each in succession, gave remarkable proofs of the extraordinary zeal with which Dr P. pursued his ethnological investigations; and not only so, for at the same time he devoted himself much to the pursuit of philology, which he rightly

judged to be absolutely necessary to an enlarged study of ethnology. In a few years, he became acquainted, not only with the Teutonic and Celtic languages, but with Sanscrit, Hebrew, and Arabic; shewing a practical result of his studies in the publication of his work entitled *The Eastern Origin of the Celtic Nations*. In this publication, which appeared at Oxford in 1831, he compared the different dialects of the Celtic with the Sanscrit, Greek, Latin, and Teutonic languages, and succeeded in proving a strong affinity between them all, from which he argued in favour of a common origin for all the peoples speaking those languages. His theory has met with general acceptance; and the work in which it appeared, says Mr Norris, 'is admitted by the most distinguished philologists to be unsurpassed in ability and soundness, while not a few deem it to be that which has made the greatest advance in comparative philology during the present century.' A previous work—namely, his *Analysis of Egyptian Mythology*, first published in 1819, had the honour of being translated into German in 1837, and edited by A. W. Schlegel, who, however, took occasion to dissent from some of the author's views. In 1843, Dr P. published the first edition of his *Natural History of Man*, in 2 vols. Two other editions of this work appeared during the author's lifetime; and a fourth, ably edited and enlarged, by Mr Edwin Norris, was given to the world in 1855. Dr P.'s other published works are for the most part on medical subjects—namely, *History of the Epidemic Fevers which prevailed in Bristol during the years 1817, 1818, and 1819*, published in 1820; *Treatise on Diseases of the Nervous System* (1822); *A Treatise on Insanity and other Diseases affecting the Mind* (1835); and *On the Different Forms of Insanity in Relation to Jurisprudence* (1842). He also contributed various articles to the *Cyclopaedia of Practical Medicine* and to the *Library of Medicine*. As a tribute to his eminence as an ethnologist, Dr P. was elected President of the Ethnological Society; while, in recognition of his researches into the nature and various forms of insanity, he received the government appointment of Commissioner in Lunacy. This occasioned his removal from Bristol to London, where, unfortunately for the interests of science, he expired of rheumatic fever, on the 22d of December 1848, at the comparatively early age of 62. Dr P.'s fame as the greatest of ethnologists, which, during his lifetime, was universally acknowledged, remains undisturbed to this day, notwithstanding any difference of opinion as to his favourite doctrine of the unity of the human race, which he constantly upheld. He was the first to raise ethnology to the rank of a science, and in his work, *The Physical History of Mankind*, he has left behind him a noble monument of his genius, skill, and perseverance.

PRICKLE (*Aculeus*), in Botany, a strong and hard, elongated and pointed hair. See **HAIRS**, in *Botany*.—The prickle is connected only with the bark, and not with the wood, in which it essentially differs from the spine or thorn. Prickles are sometimes straight, sometimes curved. They have often a pretty extended base—of some definite shape—by which they are attached to the bark.

PRICKLY HEAT is the popular name in India and other tropical countries for a severe form of the skin-disease known as *Lichen*. It more frequently attacks strangers from temperate climates than the natives, although the latter are not altogether exempt from it. The sensations of itching and stinging which attend it are intense, and give rise to an almost irresistible propensity to scratching, which of course only aggravates the

irritation. Little or nothing can be done in the way of treatment, except keeping as cool as possible; but the remedies recommended in the article **LICHEN** may perhaps slightly alleviate the symptoms.

PRICKLY PEAR, or **INDIAN FIG** (*Opuntia*), a genus of plants of the natural order *Cactææ* (q. v.), having a fleshy stem, generally formed of compressed articulations, sometimes of cylindrical articulations; leafless, except that the youngest shoots produce small cylindrical leaves, which soon fall off; generally covered with clusters of strong hairs or of prickles; the flowers springing from among the clusters of prickles, or from the margin or summit of the articulations, solitary, or corymboso-paniculate, generally yellow, rarely white or red; the fruit resembling a fig or pear, with clusters of prickles on the skin, mucilaginous, generally eatable—that of some species pleasant, that of others insipid. The fruit imparts a red colour to the urine. The prickles of some species are so strong, and their stems grow up in such number and strength, that they are used for hedge-plants in warm countries.—The **COMMON P. P.** or **I. F.** (*O. vulgaris*), a native of Virginia and more southern parts of North America, is now naturalised in many parts of the south of Europe and north of Africa, and in other warm countries. It grows well on the barest rocks, and spreads over expanses of volcanic sand and ashes too arid for almost any other plant. It is of humble growth; its fruit oval, rather larger than a hen's egg, yellow, and tinged with purple, the pulp red or purple, juicy, and pleasantly combining sweetness with acidity. It is extensively used in many countries as a substantive article of food. In the south of England, the P. P. lives in the open air, and occasionally ripens its fruit. In America, it is cultivated considerably to the north of its native region. Lime rubbish is often mixed with the soil in which it is to be planted. The fruit is imported into Britain, to a small extent, from the Mediterranean.—The **DWARF P. P.** (*O. nana*), very similar, but smaller, and having prostrate stems, is naturalised in Europe as far north as the sunny slopes of the Tyrol.—The **TUNA** (*O. tuna*), much used in some parts of the West Indies as a hedge-plant, and also valuable as one of the species which afford food to the cochineal insect, yields a pleasant fruit. It has red flowers, with long stamens, which display a remarkable irritability.

PRIDE, in Heraldry. A peacock, or other bird, when the tail is spread out in a circular form, and the wings dropped, is said to be 'in his pride.'

PRIDEAUX, HUMPHREY, an English scholar and divine, was born of an ancient and honourable family at Padstow, in Cornwall, May 3, 1648. He was educated first at Westminster School, under Dr Busby; and afterwards at Christ Church, Oxford, where he took the degree of B.A. in 1672. In 1676, he published an account of the Arundelian Marbles, under the title of *Marmora Oxoniensia*, which greatly increased his fame as a scholar, and in the following year, took the degree of M.A. The *Marmora* procured for P. the friendship of the Lord Chancellor Finch (afterwards Earl of Nottingham), who, in 1679, appointed him rector of St Clement's at Oxford, and, in 1681, a prebendary of the cathedral of Norwich. After several minor preferments he was collated, in 1683, to the archdeaconry of Suffolk; and in 1702, was made Dean of Norwich. He died November 1, 1724. His principal works are, his *Life of Mahomet* (1697), which was long very popular, and has gone through many editions, but is now entirely superseded; and *The Connection of the History of the Old and New Testament* (1715—1718). The last of these treats

with much learning, but less discernment, the affairs of ancient Egypt, Assyria, Persia, Judea, Greece, and Rome, as far as they bear on the subject of sacred prophecy. P. was a zealous but not an intolerant churchman, most conscientious in the discharge of his own duties, equally anxious that others should do theirs, and possessed of a considerably greater share of piety than was usual in his age.

PRIESSNITZ, VINCENT, the founder of Hydro-pathy (q. v.), was born at Gräfenberg (q. v.), in Austrian Silesia, October 5, 1799. He was the son of a peasant-proprietor, and received at the school of Freiwalddau an education suitable to his station, and afterwards farmed his paternal estate. It appears that a neighbour, who had been in the way of healing trifling wounds on himself and others by means of cold water, treated P. successfully in this way for a serious injury from the kick of a horse; and P., having thus had his attention directed to the virtues of cold water, and being indisputably possessed of great sharpness of intellect and aptitude for the practice of the healing art, began to give advice to his neighbours how to cure all ailments with cold water, and soon attained considerable reputation among them. Although several times brought before the authorities for unlicensed practising, the simplicity of the means he used made it impossible to interfere with him. As the number of applicants for advice went on increasing, he gradually came, by experimental modifications of the way of applying his remedy, to form a kind of system of treatment for the various cases that presented themselves. At last, about 1826, strangers began to repair to Gräfenberg, and stay there for some time for treatment; in 1829, there were as many as 49 water-patients, and in 1837, the number had risen to 586. P. continued till 1833 to carry on his farming; but after that, his practice, and the care of the establishments which he had to provide for the reception and treatment of his patients, fully occupied him. He died November 28, 1851, leaving his establishment to his son-in-law. Very different judgments have been pronounced on the character of P. and his system of treatment, mostly according to the prejudices of the critics. He himself has left nothing in writing on his method of cure.—Wunde, *Die Gräfl. Wasserheilanstalt und die P.'sche Curmethode* (6th ed. Leip. 1845).

PRIEST (Gr. *presbyteros*, Lat. *presbyter*, Fr. *prêtre*), the title, in its most general signification, of a minister of public worship, but specially applied to the minister of sacrifice or other mediatorial offices. In the early history of mankind, the functions of the priest seem to have commonly been discharged by the head of each family; but on the expansion of the family into the state, the office of priest became a public one, which absorbed the duties as well as the privileges which before belonged to the heads of the separate families or communities. It thus came to pass that in many instances the priestly office was associated with that of the sovereign, whatever might be the particular form of sovereignty. But in many religious and political bodies, also, the orders were maintained in complete independence, and the priests formed a distinct, and, generally speaking, a privileged class (see *Egyptian Priests*, *Indian Priests*, below). The priestly order, in most of the ancient religions, included a graduated hierarchy; and to the chief, whatever was his title, were assigned the most solemn of the religious offices intrusted to the body. In sacred history, the patriarchal period furnishes an example of the family priesthood; while in the instance of Melchizedec, king of Salem, we find the union of the royal with the priestly

character. In the Mosaic law, the whole theory of the priesthood, as a sacrificial and mediatorial office, is fully developed. The priest of the Mosaic law stands in the position of a mediator between God and the people; and even if the sacrifices which he offered be regarded as but typical and prospective in their moral efficacy, the priest must be considered as administering them with full authority in all that regards their legal value. The Mosaic priesthood was the inheritance of the family of Aaron, of the tribe of Levi. It consisted of a high priest (q. v.), and of inferior ministers, distributed into 24 classes. The age for admission to the priesthood is nowhere expressly fixed; but from 2d Chronicles xxxi. 17, it would seem that the minimum age was 20. In the service of the temple, the priests were divided into 24 classes, each of which was subject to a chief priest, and served, each company for a week, following each other in rotation. Their duties in the temple consisted in preparing, slaying, and offering victims; in preparing the shew-bread, burning the incense, and tending the lights of the sanctuary. Outside, they were employed in instructing the people, attending to the daily offerings, enforcing the laws regarding legal uncleanness, &c. For their maintenance were set aside certain offerings (see *FIRST-FRUIT*) and other gifts. They wore a distinguishing dress, the chief characteristics of which were a white tunic, an embroidered cincture, and a turban-shaped head-dress. The Jewish priesthood may be said to have practically ceased with the destruction of the temple.

In the Christian dispensation, the name primitively given to the public ministers of religion was *presbyteros*, of which the English name 'priest' is but a form derived through the old French or Norman *prestre*. The name given in classical Greek to the sacrificing priests of the pagan religion, Gr. *hiereus*, Lat. *sacerdos*, is not found in the New Testament explicitly applied to ministers of the Christian ministry; but very early in ecclesiastical use, it appears as an ordinary designation; and with all those bodies of Christians, Roman Catholics, Greeks, Syrians, and other orientals who regard the Eucharist as a sacrifice (see *MASS*), the two names were applied indiscriminately. The priesthood of the Christian church is one of the grades of the Hierarchy (q. v.), second in order only to that of bishop, with which order the priesthood has many functions in common. The priest is regarded as the ordinary minister of the Eucharist, whether as a sacrament or as a sacrifice; of baptism, penance, and extreme unction; and although the contracting parties are held in the modern schools to be themselves the ministers of marriage, the priest is regarded by all schools of Roman divines as at least the normal and official witness of its celebration. The priest is also officially charged with the instruction of the people and the direction of their spiritual concerns, and by long-established use, special districts, called Parishes (q. v.), are assigned to priests, within which they are intrusted with the care and supervision of the spiritual wants of all the inhabitants. The holy order of priesthood can only be conferred by a bishop, and he is ordinarily assisted by two or more priests, who, in common with the bishop, impose hands on the candidate. The rest of the ceremonial of ordination consists in investing the candidate with the sacred instruments and ornaments of his order, anointing his hands, and reciting certain prayers significative of the gifts and the duties of the office. The distinguishing vestment of the priest is the *chasuble* (Lat. *planeta*). In Roman Catholic countries, priests wear even in public a distinctive dress, which, however, in most

respects is common to them with the other orders of the clergy. In the Latin Church, priests are bound to a life of celibacy. In the Greek and oriental churches, married men may be advanced to the priesthood; but no one is permitted to marry after ordination, nor is a married priest permitted to marry a second time, should his wife die.

In the Church of England, and other Reformed Episcopal Churches, the term priest is retained as the designation of the second order of clergy, whose special office it is (1) to celebrate the Sacrament of the Lord's Supper; (2) to pronounce the forms of Absolution in the Morning and Evening Prayer, in the Communion Service, and in the Office for the Visitation of the Sick; and (3) to preach, though this last office is, by special licence, sometimes extended to deacons.

Priests only can hold a benefice with cure of souls. The age for admission into the priesthood is 24 years. (For the manner and ceremonies of admission, see *ORDINATION*.) Priests in the Church of England are ordinarily distinguished during divine service by a black stole of silk worn upon the surplice over both shoulders; deacons, according to the ancient use, wearing it over one shoulder only. Marriage is permitted in the Church of England to all orders of the clergy.

Egyptian Priests.—In the political division of Egypt, the population is supposed to have been divided into three or four castes, at the head of which was the sacerdotal, or priests. This division, however, was not very strictly observed, as the son did not invariably follow the profession of the father. That of the priest appears most honourable, and two principal classes of priests were in existence at the earliest periods—the *hont*, or prophets, and the *ab*, or inferior priests. The first were attached to the worship of all the deities of Egypt; and in the greater cities, there was *hont api*, high prophet, or priest, who presided over the others; at Thebes there were as many as four prophets of Ammon. Their duties appear to have comprised the general cultus of the deity. They also interpreted the oracles of the temples. Besides the prophets of the gods, others were attached to the worship of the king, and to various offices connected with the administration of the temples. The class of priests called *ab*, or 'pure,' were inferior, and were also attached to the principal deities and to the personal worship of the monarch. They were presided over by a superintendent, but had no high priest. A third class of priests, the *karheb*, appear in connection with funeral and other ceremonies, and some other inferior persons of the hierarchy. The *scribes* formed a caste apart, but those who were attached to the temple were of the priestly order. Besides these above mentioned, the Greeks enumerate a variety of sacred officials. The administration of the temples by the hierarchy was as follows: the temple was governed by a superintendent, or *epistetes*, called in Egyptian *mer*, either the high priest or a prophet. Under him were a vicar, and a royal officer, called *epimeletes*, or overseer, by the Greeks. These attended to the receipts and expenses. Lay brethren, or *hierodules*, attended and assisted the priests in their functions; and in addition to these, there were a kind of monks in the Serapeum, who lived within the precincts of the temple, which they were not allowed on any account to quit. At Alexandria, under the Ptolemies, there was a priest of Alexander the Great, and others attached to the worship of the deceased Ptolemies, and also one attached to the worship of the living monarch. This priest, it appears, was nominated by the king himself, and drew a revenue from the different temples of Egypt.

He was at this period the high priest of the whole country, and had no doubt superseded the former high priest of Ptah at Memphis, and of Amen-Ra at Thebes, who had formerly exercised a kind of pontificate. On solemn occasions a synod of the priests was held for purposes affecting the whole body. Some light has been thrown on the relative dignities of the hierarchy by the hieroglyphical inscription on a statue of Bakenkhonsou, a high priest of Amen-Ra, now at Munich. At the age of 16, he held a civil employment under Sethos I.; he was then made priest *ab* of Amen-Ra, which office he exercised for four years; after this, he rose to the rank of 'divine father' of the god, which office he held for 12 years; after that, he became third prophet of the same deity for 15 years; then second prophet for 12 years; and finally, at the age of 59, chief prophet or high priest of the god—held the post for 27 years, and died at the age of 86. The youthful age at which offices were held was probably owing to the careful education which the young priests had to undergo, and the habits required for the order. They were required to be scrupulously neat and clean, entirely shaven, clad in linen, and shod with papyrus sandals, and to maintain a rigid diet, in which was a careful abstaining from pork, mutton, beans, and salt, to which was added a bath twice a day, and other ablutions. They also fasted, and one of their fasts lasted 42 days; others even longer; they then lived on vegetable food alone, and exercised a rigid continence. They were, however, not unmarried, but allowed one wife. Their support was derived from various sources—as from royal and other endowments of the temples, from the gifts of votaries, and from charges on the produce of the country. On festivals, not only were they often clad in fine linen, but the addition of a panther-skin was often added to their attire; and they were anointed with perfumes and unguents. They offered water and burning incense. Although Herodotus has stated that no woman was a priestess in Egypt, many functions connected with the temples were held by women. The most important was that of 'divine wife of Amen-Ra,' called by Diodorus the *pallakis*, or concubine, of Jupiter, which was conferred upon queens and princesses only. Another title was that of 'divine hand,' or adorer of the same god, a rank also held by royal personages. During the 4th dynasty, at the time of Cheops and the pyramids, there were prophetesses; but the order does not appear to have been kept up, for at a later period there only appear the *sua*, or singing women of the gods, and the *aha*, or performers, of the principal deities, who attended with *sistra* at the festivals. Besides these, other women had charge of certain things connected with the temple, and *canephoroi*, or basket-bearers. They had no distinctive dress, and were often the wives of prophets or other priests.—Boeck, *Corp. Inscr. Græc.*, p. xxix., p. 303; Schmidt, *De Sacerdot. Egyptior.*; Wilkinson, *Manners and Customs*, vol. i. p. 257; Devéria, *Monument de Bakenkhonsou* (Paris, 1862).

Indian Priests.—The priesthood of India belongs to the first caste, or that of the Brāhman's exclusively; for no member either of the Kshatriya or the Vaisya, or the Sūdra caste is allowed to perform the functions of a priest. But as the proper performance of such functions requires, even in a Brāhman'a, the knowledge of the sacred texts to be recited at a sacrifice, and of the complicated ceremonial of which the sacrificial acts consist, none but a Brāhman'a learned in one or more Vedas (q. v.), and versed in the works treating of the ritual (see *KALPA-SŪTRA*), possesses, according to the ancient law, the qualification of a priest;

and so strict, in ancient times, were the obligations imposed upon a priest, that any defective knowledge on his part, or any defective performance by him of the sacrificial rites, was supposed to entail upon him the most serious consequences both in this life and in the future. As the duration of a Hindu sacrifice varies from one to a hundred days, the number of priests required at such a ceremony is likewise stated to be varying; again, as there are sacrificial acts at which verses from the *Rigveda* only were recited, others requiring the inaudible muttering of verses from the *Yajurveda* only; others, again, at which verses only of the *Sāmaveda* were chanted; and others, too, at which all these three Vedas were indispensable—there were priests who merely knew and practised the ritual of the *Rigveda*, or the *Yajurveda*, or the *Sāmaveda*; while there were others who had a knowledge of all these Vedas and their rituals. The full contingent of priests required at the great sacrifices amounts to 16. Other inferior assistants at a sacrifice, such as the ladle-holders, slayers, choristers, and the like, are not looked upon as priests. Such was the staff of priests required at the great and solemn sacrifices, which took place on special occasions, and could be instituted only by very wealthy people; from one to four priests, however, sufficed at the minor sacrifices, or those of daily occurrence. These were the rules and practices when the Hindu ceremonial obeyed the canon of the Vaidik ritual; and the latter probably still prevailed at the epic period of India, though many deviations from it are perceptible in the *Mahābhārata* and *Rāmāyaṇa* (q. v.). But at the Paurāṇik period, and from that time downwards, when the study of the Vedas had fallen into disuse, and the Vaidik rites had made room for other ceremonies which required no knowledge on the part of a priest, except that of the reading of a prayer-book, and an acquaintance with the observances enjoined by the *Purāṇas*, but easy to go through, almost every *Brahman*, not utterly ignorant, became qualified to be a priest.—For the priesthood of the Buddhists, Jains, and Tibetans, see **BUDDHISM**, **JAINAS**, and **LAMAISM**.

PRIESTLEY, JOSEPH, son of Jonas Priestley, a cloth-draper at Fieldhead, near Leeds, was born at Fieldhead on 13th March 1733, O.S. His mother having died when he was six years old, he was adopted by an aunt, by whom he was sent to a free school. There he learned Latin and Greek. During vacation, he taught himself various languages, both ancient and modern. For some time he was obliged to abandon his studies, owing to weak health: he then betook himself to mercantile pursuits. With returning strength, his literary studies were resumed, and successfully prosecuted at a dissenting academy at Daventry under Mr (afterwards Dr) Ashworth, successor to Dr Doddridge. Though his father and aunt were strong Calvinists, their house was the resort of many men who held very different opinions; and the theological discussions which he was in the habit of hearing, seem to have had much effect on young P.: before he was 19, he calls himself rather a believer in the doctrines of Arminius, but adds: 'I had by no means rejected the doctrine of the Trinity or that of the Atonement.' Before leaving home, he wished to join a Calvinistic communion, but he was refused admission, the ground of refusal being, that he had stated doubts as to the liability of the whole human race to 'the wrath of God and pains of hell for ever.' During his residence at the academy, he conceived himself called on to renounce nearly all the theological and metaphysical opinions of his youth. 'I came,' he says, 'to embrace what is called the heterodox side of every

question.' In 1755, he became minister to a small congregation at Needham Market, in Suffolk, with an average salary of £30 per annum. While here, he composed his work entitled *The Scripture Doctrine of Remission, which shews that the Death of Christ is no proper Sacrifice nor Satisfaction for Sin*. His leading theological doctrine seems to have been, that the Bible is indeed a divine revelation, made from God to man through Christ, himself a man and no more, nor claiming to be more. He seems to have rejected all theological dogmas which appeared to him to rest solely upon the interpretation put upon certain passages of the Bible by ecclesiastical authority. Even the fundamental doctrines of the Trinity and of the Atonement he did not consider as warranted by Scripture, when read by the light of his own heart and understanding. It does not, however, appear that these doctrinal errors produced any morally evil results. He not only contrived to live on £30 a year; but by adding a little to his income by means of teaching, he was enabled to purchase a variety of instruments to help him in his scientific studies. In 1758, he quitted Needham for Nantwich; and in 1761 he removed to Warrington, where he was appointed successor to Mr (afterwards Dr) Aikin, as teacher of languages and belles-lettres. At Warrington, he married Miss Wilkinson, a lady of great talent and amiability. Here his literary career may be said first fairly to have begun. A visit to London led to his making the acquaintance of Franklin and of Dr Price. The former supplied him with books which enabled him to write his *History and Present State of Electricity*, published in 1767. It was followed by a work on *Vision, Light, and Colours*. In 1762, he published his *Theory of Language and Universal Grammar*. In 1766, he was made a member of the Royal Society, and a Doctor of Laws by the university of Edinburgh. In the following year, he removed to Millhill, near Leeds, where he was appointed minister of a dissenting chapel. The fact of a brewery being beside his dwelling gave a new direction to his energetic and versatile mind; he began to study pneumatic chemistry, publishing various important works connected with this science. 'No one,' says Dr Thomson, 'ever entered on the study of chemistry with more disadvantages than Dr Priestley, and yet few have occupied a more dignified station in it.' While at Leeds, he agreed to accompany Captain Cook on his second voyage; but certain ecclesiastics having objected to the latitude of his theological views, the Board of Longitude refused to sanction the arrangement, and he did not go. In 1773, he was appointed librarian and literary companion to Lord Shelburn, with a salary of £250 per annum, and a separate residence. He accompanied the earl on a continental tour in the year 1774. Having been told by certain Parisian savans that he was the only man they had ever known, of any understanding, who believed in Christianity, he wrote, in reply, the *Letters to a Philosophical Unbeliever*, and various other works, containing criticisms on the doctrines of Hume and others. His public position was rather a hard one; for while laughed at in Paris as a believer, at home he was branded as an atheist. To escape the odium arising from the latter imputation, he published, in 1777, his *Disquisition Relating to Matter and Spirit*. In this work, while he partly materialises spirit, he at the same time partly spiritualises matter. He holds, however, that our hopes of resurrection must rest solely on the truth of the Christian revelation, and that on science they have no foundation whatever. The doctrines of a Revelation and a Resurrection appear with him to have supported one another. H.

believed in a Revelation, because it declared a Resurrection; and he believed in a Resurrection, because he found it declared in the Revelation. On leaving Lord Shelburn, he became minister of a dissenting chapel at Birmingham. The publication, in 1786, of his *History of Early Opinions concerning Jesus Christ*, occasioned the renewal of a controversy, which had begun in 1778, between him and Dr Horsley, concerning the doctrines of Free Will, Materialism, and Unitarianism. The victory in this controversy will probably be awarded by most men in accordance with their own preconceived views on the questions at issue. His reply to Burke's *Reflections on the French Revolution* led to his being made a citizen of the French Republic; and this led to a mob on one occasion breaking into his house, and destroying all its contents, books, manuscripts, scientific instruments, &c. He states that the sum awarded to him as damage fell £2000 short of the actual pecuniary loss. A brother-in-law, however, about this time left him £10,000, with an annuity of £200. In 1791, he succeeded to the charge at Hackney, which had become vacant by the resignation of Dr Price. He did not remain long here, however. His honestly-avowed opinions had made him as unpopular as an honest avowal of opinions generally does. He removed to America, where he was received with distinction, and took up his residence at Northumberland, Pa. The offer of a professorship of chemistry at Philadelphia he declined. In 1796, his wife died. To the day of his death, he continued to pursue his literary and scientific pursuits with as much ardour as he had shewn at any period of his active life. He died 6th February 1804, expressing his satisfaction with his having led a life so useful, and his confidence in immortality. At Paris, his *éloge* was read by Cuvier before the National Institute. He has given us his autobiography down to 24th March 1795. He was a man of irreproachable moral and domestic character, remarkable for zeal for truth, patience, and serenity of temper. He appears to have been fearless in proclaiming his convictions, whether theological, political, or scientific. See *Memoirs of his own life*, continued by his son with observations by T. Cooper. Also *life* by John Corry.

PRILOUKY, a district town of Little Russia, in the government of Poltava, and 150 miles north-west of the town of that name. Tobacco, corn, cattle, and tallow are the principal articles of trade, and are sold on the spot to dealers for export to Moscow, St Petersburg, Riga, Poland, and abroad. The climate is good, and the soil fertile. Pop. 10,484, most of whom are engaged in the cultivation of tobacco.

PRIMA DONNA (Ital.), the first female singer in an opera.

PRIMARY or **PRIMITIVE LIMESTONE**, the name formerly given to crystalline limestones, because it was supposed that they belonged to the oldest primary deposits. But as it is now known that many of these limestones are of much later origin, some even as late as the Tertiary Period, the name has fallen into disuse. See **MARBLE**.

PRIMATE (Lat. *primus*, Fr. *primat*, first) is the title of that grade in the hierarchy which is immediately below the rank of patriarch. The title strictly belongs to the Latin Church, but in its general use it corresponds with that of exarch (Gr. *exarchos*) in the Greek Church, although there were some exarchs who were not immediately subject (as were all primates) to a patriarch. This arose in the Eastern Church from the variation in the limits of the patriarchates, which were not of simultaneous origin; but in the West, where the patriarch (i. e.,

the Roman bishop) was recognised as possessing universal jurisdiction, this exemption of any particular primate from superior jurisdiction could not of course arise. The primate, as such, was the head of a particular church or country, and held rank, and, in some churches, a certain degree of jurisdiction, over all bishops and archbishops within the national church. This jurisdiction, however, was confined to the right of visitation and of receiving appeals. In Africa, the Bishop of Carthage, without the title, possessed all the rank and authority of a primate. The chief primatial sees of the West were: in Spain, Seville and Tarragona, afterwards united in Toledo; in France, Arles, Rheims, Lyon, and Rouen (among whom the Archbishop of Lyon claims the title of *Primat des Primats*, 'Primate of the Primates'); in England, Canterbury; in Germany, Mainz, Salzburg, and Trier; in Ireland, Armagh, and for the Pale, Dublin; in Scotland, St Andrews; in Hungary, Gran; in Poland, Gneseu; and in the northern kingdoms, Lund. In the Church of England the Archbishop of Canterbury is styled Primate of all England; the Archbishop of York, Primate of England.

In Ireland, the Archbishop of Armagh is Primate of all Ireland, and the Archbishop of Dublin Primate of Ireland. The title of Primate in England and Ireland confers no jurisdiction beyond that of archbishop. The name *primus* is applied in the Scottish Episcopal Church to the presiding bishop. He is chosen by the bishops out of their own number, without their being bound to give effect to seniority of consecration or precedence of diocese.

PRIMA'TÈS, the name given by Linnæus to his first order of Mammalia, and which he placed first (whence the name, Lat. *primus*, first), because he ranked man amongst them, and accounted them highest in the scale of nature. He assigned as the characters of the order, incisor teeth in the front of the mouth, four in the upper jaw, in one row; mammae two, pectoral. In this order he placed four genera, *Homo* (including man and the orang-outang), *Simia*, *Lemur*, and *Vespertilio*; corresponding to the *Bimana* (Man alone), *Quadrumania*, and *Cheiroptera* of Cuvier. This association is, however, not natural, and while many of the P. of Linnæus really occupy a higher place in the scale of nature, both as to organisation or intelligence, than many others, some—i. e., the *Cheiroptera*—are inferior.

PRIME (Lat. *prima*, the first—i. e., hour), the first of the so-called 'lesser hours' of the Roman **BREVIARY** (q. v.). It may be called the public morning-prayer of that church, and corresponds in substance with the morning service of the other ancient liturgies, allowance being made for Latin peculiarities. Prime commences with the beautiful hymn of Prudentius, *Jam lucis orto sidere*, which is followed by three, and occasionally four psalms, the last portion of which consists of the opening verses of the 118th (in the authorised version, 119th) psalm, which is continued throughout the rest of the 'lesser hours.' Prime concludes with prayers appropriate to the beginning of a Christian's day.

PRIMOGENITURE is the rule of law under which the eldest son of the family succeeds to the father's real estate in preference to, and in absolute exclusion of, the younger sons and all the sisters. This is the rule adopted in Britain and in most European countries, though latterly the policy of the rule has been disputed, and the contrary example of France pointed to as an example or a warning, according to the theory advocated. The rule operates as follows: whenever a man dies intestate, leaving real estate—i. e., lands and houses—his eldest son is the only person entitled by law to the whole; and if

the other brothers and the sisters are not otherwise provided for out of the personality they are left destitute. If the eldest son is dead, but has left an eldest son, such grandson of the deceased, in like manner, succeeds to the whole lands exclusively, and so on, following in succession, the eldest sons of eldest sons, and their next eldest sons, one by one, in their order of seniority. But when the male line is exhausted, then females do not succeed in the same way singly and by seniority, but all together succeed jointly. Such is the rule in England and in Scotland. The preference of males to females was also the Jewish rule and the Greek rule, or at least that which prevailed at Athens; but it was unknown to the Romans. It is generally said our preference of males took its origin from the feudal system, by which the devolution of land depended on the personal ability of the party to perform military service. Our Danish ancestors seem not to have acknowledged any preference of the males, but the Saxons did so. Our law does not, like the Salic law, totally exclude females, but merely postpones them until the males are exhausted. Though, however, it is the general law of England, as well as Scotland and Ireland, there is one county in England, that of Kent, where, by ancient custom—called gavelkind—a different rule prevails, and the land, instead of going wholly to the eldest son, is divided equally among all the sons. So there is an exception, called Borough English, in some boroughs and cities of England, where the land, instead of going to the eldest son, goes wholly to the youngest son. The evils said to be attendant on the law of primogeniture are alleged to be, that it often produces great hardship, by making one of the family enormously rich, and the others very poor, thereby introducing a sense of inequality and injustice among those who are apt to believe themselves equals by the law of nature. It also tends to encourage the accumulation of landed property in a few hands, and thereby cuts off the great mass of the people from the gratification of a natural desire and from one incentive to industry—viz., the acquisition of a portion of the soil. On the other hand, it is said that the cases of hardship in reality seldom occur, for, especially in modern times, an equal amount of personal property is often held by the same owners, and the rule does not apply to personality, which is equally divided among all the children. Moreover, the great landowners seldom die intestate, but almost invariably provide for their younger children by means of charges or burdens on the family estate, and so counteract the effect of the law of primogeniture. The accumulation of landed property is said to be not an evil, but the contrary, for it enables agriculture to flourish, inasmuch as the larger the farms, the greater is the capital required, and the greater benefit to the land, and ultimately to the public. The law of primogeniture in England is not, as it is or was in Scotland, stereotyped in its most odious form by the practice of entailing the lands, and so locking them up for generations in one family, secluding them from commerce, and of necessity preventing the successive heirs in possession from making improvements. The evils of the Scotch entail system have long been exposed, and led, in 1848, to a relaxation of the law, by which the practice of disentailing the property is made more easy and frequent. But in England, land cannot be locked up for a greater period than the lives of persons in existence, and for 21 years more, after which the parties entitled can sell or bring the lands into the market at their discretion; so that it is not correct to say that the accumulation of land in the great families is caused by the law of primogeniture, for practically each

successive generation can do what it likes with the property, and squander it at will. It is only by the operation of the natural feelings of family pride that the family estates are kept together in a family. The mode in which this is practically done in England is as follows: the peer or head of the family being tenant for life, and the inheritance being entailed upon his eldest son, who is about to marry, the father and son take the proper legal steps (which they can always do jointly) for unsettling the estate, and obtaining the absolute dominion over it. They then proceed to resettle the estate, making the father as before tenant for life, then the son is reduced in his turn to a tenant for life also, after the father, instead of, as before, being tenant in tail, or full proprietor. Thus, the maintenance of the family dignity is secured for another generation by settling the inheritance on the eldest male issue of the intended marriage; and when the grandson attains the age of 21, or is about to marry, he and his father act in the same way towards the next generation. The English law of landed property has been said to answer admirably all the purposes to which it is applicable, for a testamentary power is given which stimulates industry, and encourages accumulation; and while capricious limitations, such as perpetual entails, are restrained, property is allowed to be moulded according to the circumstances and wants of every family.

PRIMROSE (*Primula*), a genus of plants of the natural order *Primulaceae*, having a bell-shaped or tubular 5-toothed calyx, a salver-shaped corolla with five segments, five stamens, a globose germen containing many ovules, and a many-seeded capsule opening by five valves, and generally with ten teeth at the apex. The species are all herbaceous perennials, generally having only radical leaves; and the flowers in a simple umbel, more rarely with scapes bearing solitary flowers. Almost all of them are natives of Europe and the north of Asia. Some of them are among the finest ornaments of our groves and meadows; some are found in mountainous regions. Their fine colours and soft delicate beauty have led to the cultivation of

Common Primrose (*Primula vulgaris*).

some of them as garden flowers, probably from the very beginning of floriculture. The name *P.* (Fr. *Primevère*, Lat. *Primula*) is derived from the Latin *primus*, first, and refers to the early appearance of the flowers of some of the most common species in spring.—The Common *P.* (*P. vulgaris*), abundant in woods, hedgebanks, and pastures in Britain and in most parts of Europe, has obovate-oblong, wrinkled leaves, and single-flowered scapes; the flowers about an inch broad, yellowish white. This is the plant to which the English name *P.* specially belongs. Akir

so it is the COWSLIP (q. v.), or PAIGLE (*P. veris*), and perhaps still more nearly related is the OXLEAF (*P. elatior*), apparently wild in some parts of England, particularly in the eastern counties, but supposed by some botanists to be intermediate between the Common P. and the Cowslip, which they therefore regard as extreme forms of one species.—The POLYANTHUS (q. v.) is a cultivated variety of the Cowslip.—The AURICULA (q. v.) (*P. auricula*), an Alpine species, is a favourite garden flower.—The BIRD'S EYE P. (*P. farinosa*) and the SCOTTISH P. (*P. Scotica*) are both flowers of exquisite beauty, found in the northern parts of Britain; the latter chiefly on the coasts of Sutherland, Caithness, and the Orkney Islands. The Alps and the Himalaya Mountains produce several species.—The CHINESE P. (*P. Sinensis*) has for more than thirty years been very common in Britain, not only as a greenhouse but a window plant. It produces compound umbels of very numerous lilac or white flowers, which are displayed in autumn, winter, and spring.

PRIMULACEÆ, a natural order of exogenous plants, containing more than 200 known species, mostly natives of temperate and cold regions. They are all herbaceous, or scarcely half-shrubby, with leaves generally all radical, and no stipules. The calyx is generally 5-cleft, inferior or half-superior, regular, persistent; the corolla, with the limb divided into as many segments as the calyx, rarely wanting; the stamens inserted on the corolla, one opposite to each of its lobes; the ovary one-celled, the style solitary, the stigma capitate; the capsule with a central placenta and many seeds.—Many of the P. have flowers of much beauty, and some are very fragrant, as the Primrose, Cowslip, Auricula, Pimpernel, Loosestrife, &c.

PRIMUM MOBILE. See PTOLEMAIC SYSTEM.

PRINCE (Lat. *princeps*, from *primus*, first, and *capio*, I take), an epithet which was originally applied to the *princeps senatus* of the Roman state, and afterwards became a title of dignity. It was adopted by Augustus and his successors; hence the word was afterwards applied to persons enjoying kingly power, more especially the rulers of small states, either sovereign, as in the case of the ancient Princes of Wales, or dependent, like the rulers of certain states in Germany. The title is now very generally applied to the sons of kings and emperors, and persons of the blood-royal. In various parts of continental Europe, the title Prince is borne by families of eminent rank, but not possessed of sovereignty; and in England, a duke is, in strict heraldic language, entitled to be styled 'High Puissant and most Noble Prince;' and a Marquess or Earl as 'Most Noble and Puissant Prince.' Practically, however, in Britain, the term prince is restricted to members of the royal family. The eldest son of the reigning sovereign is by a special patent created Prince of Wales, and this is the only case in which the title prince is connected with a territorial distinction. In Germany, the ambiguity of applying the same title to the members of royal houses and princely families, not sovereign, is avoided, the former being styled 'Prinz,' the latter 'Fürst.' The German Fürst takes rank below the Duke (Herzog). Most of the counts who had a seat in the old German Diet were elevated to the dignity of Prince on their acquiescence in the dismemberment of the German empire. In a more general acceptance, the term prince is often used for a sovereign or the ruler of a state.

PRINCE EDWARD ISLAND, a province of the Dominion of Canada, in the Gulf of Saint Lawrence, separated from New Brunswick and

Nova Scotia by the Strait of Northumberland, lat. about 45° 56'—47° 4' N., long. 62°—64° 23' W. Length, 134 miles; breadth, 4 to 34 miles; area, 2137 square miles. Pop. (1841), 47,034; (1861), 80,857; (1881), 108,891. The surface is undulating; but few of the hills, the chief of which are in the middle of the island, and run from north to south, are upwards of 300 feet in height. The coasts are girdled by a bold line of red sandstone cliffs, varying in height from 20 to 100 feet, and are indented with numerous bays and inlets, several of which, as Cardigan Bay on the east, the entrance to Georgetown, and Hillsborough Bay on the south, the entrance to Charlottetown (the capital of the colony), are deep and spacious, and afford safe anchorage for large vessels. Other inlets are Bedeque and Egmont Bays on the south, and Holland, Richmond, and St Peter's Bays on the north. The rivers are mostly short. The soil, which is well watered with numerous springs and rivers, rests upon red sandstone, and consists for the most part of a layer of vegetable matter above a light loam, which rests upon stiff clay above sandstone. It is of great fertility, and the agricultural products are about double the quantity required for local consumption. Of the whole area, consisting of 1,360,000 acres, 1,300,000 acres are 'good' land, and 60,000 acres are 'poor' land; and in 1851, there were under cultivation 215,389 acres; in 1871, 1,097,860 acres. Since the year 1848, agriculture has become a much more important branch of industry. In 1871, the inhabitants were over 30,000 more in number than in 1848; and within the same time the agricultural products had increased in many instances fourfold. In 1871, the amount of wheat produced was 269,392 bushels; of barley, 176,441 bushels; oats, 3,128,574 bushels; potatoes, 3,375,726 bushels. Live stock, 25,329 horses; 62,984 cattle; 147,364 sheep; 52,514 pigs. The soil and climate are admirably adapted for producing wheat, and all the cereals, fruits, and vegetables grown in temperate climes are produced here. The climate, milder than that of the continental regions in the vicinity, and free from the fogs which prevail on Cape Breton and Nova Scotia, is very healthy. P. E. I. is extremely poor in minerals; copper and bog-iron ore are known to exist in small quantities. In the neighbouring waters, extensive and profitable fisheries are carried on. The colony owns about 1200 boats engaged in the fisheries; and the total value of the fish caught—principally mackerel, alewives or gaspereaux (which belong to the herring family), herrings, cod-fish, and hake—is about 225,000 dollars. Manufactures are not important, though cloth is made to some small extent. In 1871, the total tonnage of vessels that entered and cleared the ports of the colony was 547,406 tons, of which total 493,909 tons belonged to British vessels. The value of total imports for 1873-74 amounted to £382,740, of the exports to £144,426. The revenue of the colony for 1874 was £81,270, and the expenditure £88,780. P. E. I. became a province of the Dominion of Canada in 1873. The colonial government is vested in the lieutenant-governor, an executive council of 9 members, a legislative council of 13 members, and a legislative assembly of 30 representatives. Charlottetown, with two banks, two colleges, the Prince of Wales' College, and St. Dunstan's (Catholic), and a population, in 1871, of 10,000, is the capital. The free school system was introduced in 1853. Besides the educational institutions at Charlottetown, there are also a normal and about 375 elementary schools, and 15 grammar schools. The number of pupils enrolled in 1874 was 16,236.

Prince Edward Island is divided into 3 counties—Prince, Queen's, and King's counties—of which

the chief towns are respectively Summerside, Charlottetown, and Georgetown. All parts of the island are traversed by coach-roads; and 50 miles of telegraph, 10 miles of which are submarine, belong to the island. In 1872, a railway, 200 miles in length, was commenced to connect Charlottetown with the principal places on the island; the route traverses nearly the whole length of the island. Of the entire population, 53,256 are Protestants of different denominations, and 40,765 are Roman Catholics. The island was first taken possession of by the British in 1745, and was retaken by them, and finally annexed to their possessions in 1758.

PRINCE OF WALES, the title borne by the eldest son of the sovereign of England. The native sovereigns of Wales were so designated in the days of Welsh independence; and on the conquest of Wales, the principality of Wales and earldom of Chester were bestowed by Henry III. on his son, afterwards Edward I., but as an office of trust and government, rather than as a title. It is traditionally related that Edward I. engaged to give the Welsh people a prince who would be born among them, and not know a word of English, and fulfilled the promise by bestowing the principality on his infant son, Edward, born at Caernarvon Castle. Edward, by the death of his elder brother, became heir-apparent. Edward III., his son, was never Prince of Wales; but in 1343, he invested his son Edward the Black Prince with the principality, and from that time the title of Prince of Wales has been borne by the eldest son of the reigning king. The title is, however, not inherited, and has usually been bestowed by patent and investiture, though, in a few instances, the heir to the throne has become Prince of Wales simply by being so declared. The eldest son of the sovereign is by inheritance Duke of Cornwall, a title first conferred in 1337 on Edward the Black Prince, on the death of his uncle, John of Eltham, the last Earl of Cornwall, and held, according to the terms of the grant, by the first-begotten son of the king. The title of Earl of Chester, borne by Edward III. before his accession to the throne, has since been given along with the principality of Wales. That earldom was, by 21 Richard II. c. 9, erected into a principality; and it was enacted that it should be given in future to the king's eldest son—a precedent which has since been followed, although that statute, along with all others in the same parliament, was repealed by 1 Henry IV. c. 3. On the death of a Prince of Wales in his father's lifetime, the title has been conferred on the sovereign's grandson, or next younger son, being heir-apparent. As heir of the crown of Scotland, the eldest son of the sovereign is Prince and High Steward of Scotland, Duke of Rothesay, Earl of Carrick, Baron of Renfrew, and Lord of the Isles. The high office held by the House of Stewart (see STEWART, HOUSE OF) became merged in the crown when Robert II., the representative of the family, ascended the throne of Scotland in 1371. The earldom of Carrick was conferred by Robert II. on his eldest son. The dukedom of Rothesay was created by a solemn council held at Scone in 1398, and conferred on David, eldest son and heir of Robert III.; and when David, in 1402, fell a victim to the ambition of his uncle, it was transferred to his brother James, afterwards James I. of Scotland. Renfrew was the chief patrimony of the Stewards of Scotland, to whom it was granted by the sovereign in the 12th century, their principal residence having been in the burgh of Renfrew. In 1404, King Robert III. granted the barony of Renfrew and other portions of the estates of the Stewards to his son and heir, James, since which time the eldest

son of the sovereign has borne the title of Baron of Renfrew. By act of the Scottish parliament of 1469, the titles of Prince and High Steward of Scotland, Duke of Rothesay, Earl of Carrick, Baron of Renfrew, and Lord of the Isles were vested in the eldest son and heir-apparent of the crown of Scotland for ever. The present Prince of Wales was created Earl of Dublin on September 10, 1849, that dignity being destined to him and his heirs, kings of the United Kingdom of Great Britain and Ireland, for ever.

An annuity of £40,000 was settled on the Prince of Wales by 26 Vict. c. 1. He has besides the revenues of the duchy of Cornwall. These amounted previously to 1840 to between £11,000 and £16,000; since that period, they have greatly risen, amounting in 1869 to £63,587, and in 1871 to £91,328. Only a small part of this income was expended during the minority of the present Prince of Wales, and the yearly accumulations amounted, in November, 1862, to upwards of £500,000. An income of £10,000 has been settled by parliament on the Princess of Wales, to be raised to £30,000 in the event of her widowhood. The annuities of the Prince and Princess of Wales are charged on the Consolidated Fund.

The Prince of Wales has a separate household, as also has the Princess of Wales. Act 35 Geo. III. c. 125 makes provision to prevent the accumulation of debt by any future heir-apparent to the crown, and enacts that as soon as he shall have a separate establishment, the treasurer or principal officer shall make a plan of such establishment in distinct departments and classes, with the salaries and payments of each class, and of each individual officer; and the treasurer is made responsible for the punctuality of all payments, and required to submit his accounts to the Lords of the Treasury. The statute of treasons, 25 Edw. III., makes it treason to compass the death of the Prince of Wales, or violate the chastity of his consort.

By a statute of the order of the Garter, of date 1805, the Prince of Wales becomes a Knight of the Garter as soon as he receives that title.

In 1788, on the illness of George III., it was made a question whether the Prince of Wales was not, as heir-apparent, entitled to the regency; the recovery of the king prevented the necessity for a decision, but it is now held that he has no such right.

The arms of the Prince of Wales are those of the sovereign, differenced by a label of three points argent, and the present Prince of Wales bears *en surmount* the escutcheon of the house of Saxony. The supporters and crest are the same as those of royalty. The ancient coronet of the Princes of Wales was a circle of gold set round with four crosses patée, and as many fleurs-de-lis alternately. Since the Restoration, it has been closed with one arch only, adorned with pearls, surmounted by a mound and cross, and furnished with a cap trimmed with ermine, like that of the sovereign. The Prince of Wales has further a distinguishing badge, composed of a plume of three white ostrich feathers, encircled by an ancient coronet of a Prince of Wales, and accompanied by the motto 'Ich dien' (I serve). This device is said by a tradition, on which considerable doubts have been thrown, to have been first assumed by the Black Prince after the battle of Crécy, 1346, when he took such a plume from John, king of Bohemia, whom he had slain with his own hand. The motto has been supposed to allude to the fact that the king of Bohemia served, or was stipendiary to, the French king in his wars.

PRINCE OF WALES ISLAND, or PU'LO PINA'NG (Betel Nut Island), an important British

possession, lies at the mouth of the strait of Malacca, a few miles from the west coast of the Malay Peninsula, in lat. $5^{\circ} 16' - 5^{\circ} 30' N.$, and long. $100^{\circ} 9' - 100^{\circ} 25' E.$, and has an area of 154 square miles. Pop. 45,000. A belt of coco-nut and lofty areca palms runs along the coast. A slip of low land, interspersed with hills, stretches along the east side of the island, where rice, pepper, betel, fruits, provisions, &c., are planted on the level parts; nutmeg and clove-trees on the heights. This district is watered by numerous streams, cut by well-kept roads, and dotted with villas and gardens. Sugar, coffee, and pepper plantations are on the south and south-west coasts; thence rises a wooded mountain ridge, which increases in elevation towards the north, where, at the Sanitarium bungalows of Strawberry Hill, it attains a height of 2700 feet. The rocks are granite and mica schist; the soil, a rich vegetable mould.

The climate of P. of W. I. is healthy, a sea-breeze blowing every day, and rain falling during all the months of the year, except January and February. In the low lands, the thermometer ranges from 80° to 90° , and at Strawberry Hill, from 62° to 75° , affording a pleasant change within a few miles of Georgetown. From the Sanitarium, a splendid view is obtained of the plantations, town, shipping, and the lofty hills of Queda.

The products are timber, pepper, sugar, nutmegs, cloves, coffee, coco and areca nuts, ginger, sweet potatoes, rice, &c.; and the pine-apple, shaddock, plantain, banana, orange, lemon, mango, guava, &c., abound. The large spice-plantation, Glucer, produces from £12,000 to £15,000 annually. The import and export trade has an average yearly value of about £600,000. European and American manufactures, and a share of the produce of the Eastern Archipelago, China, India, Siam, and Burmah, enter the emporium of P. of W. I., thence to find their way to suitable markets.

Georgetown, the capital (pop. 25,000), is situated in the north-east of the island, and is defended by Fort Cornwallis. The governor's house and the hospital are at some distance from the town, which is the seat of government for the Eastern Straits settlements, including Malacca and Singapore. On the peninsula opposite, lies the province of Wellesley, with an area of 160 square miles, laid out in sugar, nutmeg, and clove plantations. The population of this dependency and the island amounts to upwards of 90,000, of whom 62,000 are Malays, 16,000 Chinese, 400 Europeans and their descendants, the remainder being Siamese, Burmans, Bengalese, &c.

Towards the end of last century, a Captain F. Light married the daughter of the king of Queda, from whom he received the gift of P. of W. I.; but in 1786, it was handed over to the East India Company, who retained Captain Light as superintendent, and paid the king 6000 dollars annually. By an arrangement to pay an additional 4000 dollars yearly, the province of Wellesley was afterwards ceded to the Company. Population rapidly increased, the forests were cleared for plantations, and a large trade sprung up. It has been nearly stationary for several years, except in agriculture, owing to the more favourable situation of Singapore for the general commerce of these seas.

PRINCE RUPERT'S DROPS. These scientific toys, so called from Prince Rupert (see **RUPERT**), their inventor, are simply drops of glass thrown, when melted, into water, and thus suddenly consolidated. They have usually a form somewhat resembling a tadpole. The thick end may be subjected to smart hammering on an anvil without its breaking; but if the smallest fragment of the tail be nipped off,

the whole flies into fine dust with almost explosive violence. The phenomenon is due to the state of strain in the interior of the mass of glass, caused by the sudden consolidation of the crust. The crust is formed while the internal mass is still liquid. This tends to contract on cooling, but is prevented by the molecular forces which attach it to the crust. It is therefore somewhat in the state of the dog-head of a gun on full-cock, which will stand a smart blow without falling; while a slight touch applied to the trigger allows the spring to act. Another example of the same state of constraint is the Bologna phial—a glass cup with its sides thin, but the bottom very thick. It also is cooled as quickly as possible. A bullet may be dropped into it with safety from a considerable height; but if a small, sharp-edged fragment of flint be dropped in, so as to scratch the surface in the slightest degree, the molecular forces are set free, and the whole falls to pieces.

PRINCE'S METAL. See **TIN**.

PRINCETON, a township and village in New Jersey, 40 miles north-east of Philadelphia, and 11 miles north-east of Trenton; the site of a Presbyterian theological seminary founded in 1813. It has a bank, newspaper, several churches, the College of New Jersey, founded in 1746, which was presided over by Rev. Aaron Burr and Rev. Jonathan Edwards; it has 24 professors, 328 students, and a library of 28,000 volumes. P. was the scene of a battle fought 3d January, 1777, between Americans under Washington and British troops under Colonel Mawhood. The latter were defeated. Pop. of the village in 1870, 2800; in 1880, 4348.

PRINCIPAL, a presiding governor, or chief in authority. The word is applied to the head of a college or university in Scotland.

PRINCIPAL, in Music, the name of a stop or row of metal mouthpipes in an organ, the pitch of which is an octave higher than the open diapason, and an octave lower than the fifteenth. It serves to blend these stops, as well as to increase the volume of sound. The principal is the stop first tuned, and all the other stops are tuned from it.

PRINCIPAL, the name given to the chief rafters and braces in a Roof (q. v.).

PRINCIPAL AND ACCESSORY. See **ACCESSARY**.

PRINCIPAL AND AGENT. The law of principal and agent is founded on the absolute necessity of having some one to act for another in times and places when the latter is not personally present, and this necessity pervades nearly all branches of the law; and as a general rule, the act of the agent is just as binding on the principal, and produces the same effect, as regards his liability, as if the principal had acted in person. Agents are divided into many classes; indeed, nobody can escape, in one capacity or another, being occasionally the agent of somebody else. Attorneys, solicitors, advocates, brokers, auctioneers, &c., may be said to make a business of agency. A wife is, in Law, for many purposes of household management, the agent of the husband, and so are the children. Mercantile agents are generally called factors or brokers. The contract between principal and agent implies that the agent shall keep within the limits of his commission, and that the principal will ratify and accept all his contracts, and relieve him of the liabilities. The remuneration of the agent is generally called his commission. As the agent binds his principal, it follows that the principal can be sued by third parties who deal with the agent. The

nice distinctions that exist in the law on this subject as to the mutual rights and liabilities of the parties are too numerous to be here noticed.

PRINCIPAL AND SURETY. See SURETY.

PRINCIPATO, CITRA and ULTRA, formerly the name of two provinces of the kingdom of Naples. *Principato Citra*, now forming the province of Salerno in the reorganised kingdom of Italy, is a maritime province, bounded on the S.W. by the Mediterranean, and on the N. by the province of *Principato Ultra*, now called Avellino. The united area of the two provinces is 3405 square miles; pop. 917,426. Principal towns in *Principato Citra* are Salerno (from which it derives its present name), Sarno, and Pagani; in *Principato Ultra*, Avellino (from which it takes its present name), Ariano, and Cervinara.

PRINTERS, LAW AS TO. There are various British restrictions on the sale and use of printing-presses, which have been imposed in consequence of the extended and secret influence often exercised by them; and the law of treason and libel is intimately associated with the press. By an act of 39 Geo. III. c. 79 (amended by 51 Geo. III. c. 65, and 2 and 3 Vict. c. 12), entitled an act for suppressing seditious and treasonable practices, reciting the mischief produced by the publication of irreligious, treasonable, and seditious libels, and the difficulty of tracing the authors, it is enacted that every person having a printing-press, or types for printing, shall give notice thereof to the clerk of the peace where the same is intended to be used, and shall obtain a certificate of registration, otherwise he is liable to a penalty of £20. But the Queen's printers for England and Scotland, and the university presses of Oxford and Cambridge, are excepted. So letter-founders and makers of types must register themselves under a like penalty; and they must keep an account of all the persons to whom types and presses are sold, which account may be inspected by a justice of the peace. So printers must keep a copy of every paper they print for hire or reward, and shall endorse thereon the name of the person employing them to do so, under a penalty of £20. Every printer who shall print a book or paper without having the printer's name and address on the first or last leaf thereof, shall, by the act 2 and 3 Vict. c. 12, s. 2, forfeit £5 for every copy printed; but the only person who can sue for or enforce this penalty is the Attorney or Solicitor General of England, or the Lord Advocate of Scotland. But for the previous penalties, any informer may sue, and the justices may mitigate the penalties to £5. It follows from these enactments that a printer cannot recover his expenses for labour and materials in printing a work, unless he has complied with the statutory requirements. On a recent occasion, in which a printer in England who sued for his account was met with a defence founded on these statutes, it was discovered by the London printers that few of them had registered themselves, and accordingly they took occasion to repair the error. With regard to the printing trade, many customs prevail which do not differ in point of law from the customs affecting other trades, it being the rule that customs of a peculiar trade are binding unless specially excluded. As to obscene prints, see **OBSCENE**.

PRINTING is the art of producing impressions, from characters or figures, on paper or any other substance. There are several distinct branches of this important art—as the printing of books with movable types, the printing of engraved copper and steel plates (see **ENGRAVING**), and the taking of impressions from stone, called **Lithography** (q. v.). We have now to describe the art of printing books

or sheets with movable types, generally called *letter-press printing*, and which may undoubtedly be esteemed the greatest of all human inventions.

The art of printing is of comparatively modern origin, only 400 years having elapsed since the first book was issued from the press; yet we have proofs that the principles upon which it was ultimately developed existed among the ancient Assyrian nations. Entire and undecayed bricks of the famed city and tower of Babylon have been found stamped with various symbolical figures and hieroglyphic characters. In this, however, as in every similar relic of antiquity, the object which stamped the figures was in one block or piece, and therefore could be employed only for one distinct subject. This, though a kind of printing, was totally useless for the propagation of literature, on account both of its expensiveness and tediousness. The Chinese are the only existing people who still pursue this rude mode of printing by stamping paper with blocks of wood. The work which they intend to be printed is, in the first place, carefully written upon sheets of thin transparent paper; each of these sheets is glued, with the face downwards, upon a thin tablet of hard wood; and the engraver then, with proper instruments, cuts away the wood in all those parts on which nothing is traced; thus leaving the transcribed characters in *relief*, and ready for printing. In this way, as many tablets are necessary as there are written pages. No press is used; but when the ink is laid on, and the paper carefully placed above it, a brush is passed over with the proper degree of pressure. A similar kind of printing by blocks, for the production of playing-cards and rude pictures of scriptural subjects, was in use in Europe towards the end of the 14th century. But in all this there was little merit. The great discovery was that of forming every letter or character of the alphabet separately, so as to be capable of rearrangement, and forming in succession the pages of a work, thereby avoiding the interminable labour of cutting new blocks of types for every page. The credit of discovering this simple yet marvellous art is contested by the Dutch in favour of Laurence Coster (q. v.), between 1420 and 1426; and by the Germans, on behalf of Johann Gensfleisch of the Gutenberg (q. v.) family, about 1438. In all probability, the discovery was made almost simultaneously—such a theory being consistent with the general social progress at the period, and the secrecy which both inventors at first maintained respecting their art. The types first employed were of wood; but soon the practice of casting them in metal was introduced. See **TYPES**. The earliest of these metal types resembled the black letter in use by transcribers, and one great aim of the first printers was to produce books which should closely resemble the works in manuscript hitherto in use. Between 1450 and 1455, Gutenberg succeeded in printing a Bible, copies of which are now exceedingly rare and valuable. It is in quarto size, double columns, the initial letters of the chapters being executed with the pen, in colours. Besides this Bible, some other specimens of the work of Gutenberg, the produce of his press at Mayence, have been discovered. The Dutch, at Haarlem, preserve and shew with reverential care similar specimens of early printing by Coster. Mayence, Strasburg, and Haarlem were indisputably the places where printing was executed before the art was extended to Rome, Venice, Florence, Milan, Paris, Tours, and other continental cities. Previous to 1471, it had reached these and various other places; and about the same year, Caxton (q. v.) introduced the art into England, by setting up a press in Westminster Abbey.

Printing was introduced into Scotland about 30 years after Caxton had brought it to England; in 1551, it reached Dublin, and to other quarters it found its way very slowly. While coming into notice, its progress had been interrupted by the broils consequent on the Reformation; and soon afterwards, it was retarded by the civil war in Great Britain. Even the Restoration acted detrimentally, for it led to an act of parliament which prevented more than 20 printers carrying on their art in England. Printing, in short, has in almost every country been an ill-used art; and is still in various countries practised under fiscal restrictions. In Germany and Holland, where it originated, it has, on account of sundry obstructions, gained little way—the work produced at Mayence and Haarlem being, for example, still of a very inferior kind; while, in recent times, in England and the United States, the art has attained to extraordinary proficiency. Printing is now conducted in all the British colonial possessions, but in few is the work of a superior character—the best perhaps being that produced at Melbourne in Victoria.

Retarded by the jealousy of governments, printing for some ages derived little advantage from mechanical ingenuity. Originating at the middle of the 15th, the art continued to be conducted until the middle of the 17th c. in a very clumsy manner. The press resembled a screw-press, with a contrivance for running the form of types under the point of pressure; force having been thus applied, the screw was relaxed, and the form withdrawn with the impression executed on the paper. The defects of this very rude mechanism were at length partially remedied by an ingenious Dutch mechanic, Willem Jansen Blaeu, who carried on the business of a mathematical instrument-maker at Amsterdam. He contrived a press, in which the carriage holding

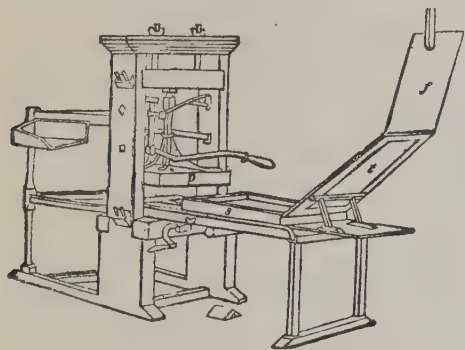

Fig. 1.—Old Common Press.

the form was wound below the point of pressure, which was given by moving a handle attached to a screw hanging in a beam having a spring, which spring caused the screw to fly back as soon as the impression was given. This species of press, which was almost entirely formed of wood, continued in general use in every country in Europe till the beginning of the present century. With certain lever powers attached to the screw and handle, it is represented above.

In connection with this representation of the old common press, the process of printing may be described. The form, being laid on the sole of the press (*s*), is fixed at the sides, so as to render it immovable from its position. There are two men employed: one puts ink on the form, either by means of stuffed balls or by a composition-roller,

and the other works the press. The latter lifts a blank sheet from a table at his side, and places it on what is called the *tymp*an (*t*), which is composed of parchment and blanket-stuff, fitted in a frame, and tightened like the top of a drum—and hence its name—and which, by means of hinges connecting it with the sole, folds down like a lid over the form. As the sheet, however, would fall off in the act of being brought down, a skeleton-like slender frame, called a *frisket* (*f*), is hinged to the upper extremity of the tymp,an, over which it is brought to hold on the paper. Thus, the frisket being first folded down over the tymp,an, and the tymp,an next folded down over the form, the impression is ready to be taken. This is done by the left hand of the pressman winding the carriage below the *platen* (*p*), or pressing surface, and the impression is performed by the right hand pulling the handle attached to the screw mechanism. The carriage is then wound back, the printed sheet lifted off, and another put on the tymp,an, the form again inked, and so on successively. In the above engraving, the press appears with the frisket and tymp,an sloping upwards, ready to receive the sheet, the frisket being sustained from falling backwards by a slip of wood depending from the ceiling. One of the greatest niceties connected with this art is the printing of the sheet on the second side in such a manner that each page, nay, each line, shall fall exactly on the corresponding page and line on the side first printed. To produce this desirable effect, two iron points are fixed in the middle of the sides of the frame of the tymp,an, which make two small holes in the sheet during the first pressure. When the sheet is laid on to receive an impression from the second form, these holes are placed on the same points, so as to cause the two impressions to correspond. This is termed producing *register*; and unless good register is effected, the printing has a very indifferent appearance. However improved, a press of the above description could not impress more than half a sheet; and the practice was to first squeeze so much of the sheet, then relax the handle, wind the second half below the platten, and print it in turn. Thus, each sheet required four squeezes to complete it—two on each side. It is not without a degree of wonder that one reflects on the rudimentary clumsiness of the whole operation; and it seems not less marvellous, that it was by no other process that the best typography could be produced until the conclusion of the 18th century.

The first improvement upon the printing-press was made by the celebrated Earl Stanhope. He constructed the press of iron, and that of a size sufficient to print the whole surface of a sheet, and he applied such a combined action of levers to the screw as to make the pull a great deal less laborious to the pressman; the mechanism altogether being such as to permit much more rapid and efficient working. A multitude of improvements speedily succeeded that of Earl Stanhope, in most of which the screw was dismissed, the pressure being generally effected by levers, or by the simple and efficient principle of straightening a joint. Among those which have gained a large share of approbation may be mentioned the *Columbian press*, which is of American invention. This press, a representation of which is annexed, was brought to Great Britain in 1818 by Mr George Clymer of Philadelphia, and patented. The pressing-power in this instance is procured by a long bar or handle acting upon a combination of exceedingly powerful levers (*a, a, a*) above the platten; the return of the handle or levers being effected by means of counterpoises or weights (*c, c*). For ease and facility of *pull*, this press is preferred by most workmen; and certainly the

powerful command which the leverage enables the workman to exercise, is favourable to delicacy and exactness of printing—his arm feeling, as it were,

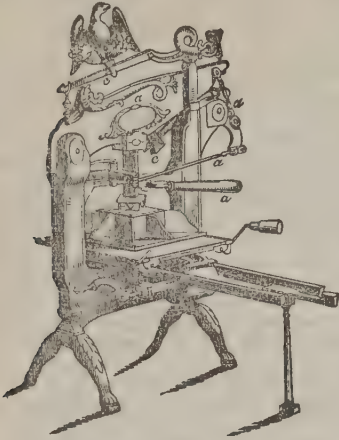

Fig. 2.—Columbian Press.

through the series of levers to the very face of the types. In the present day, the old wooden press of Blaeu is entirely discarded from use.

To secure good printing, the following points are essential. 1. The types, carefully set, fixed with precision in forms, rendered level all over, so that all parts may be pressed alike, and the whole properly cleaned by a wash of potash lye. 2. A uniform inking of the surface, to give uniformity of colour. 3. The paper damped equably, neither too much nor too little, so as to take an impression easily and evenly. 4. An equable, firm, and smart pressure, and with that degree of steadiness in the mechanism that the sheet shall touch and leave the types without shaking and blurring. 5. Care in adjusting the pointers (or gauge), so that perfect register may be secured in printing the second side. 6. Such frequency in changing *fly* or under-sheets on the tympan, that the first side shall not get dirtied by off-setting when printing the second side. 7. The laying of small patches on the tympan, where, from any inequality, it seems necessary to bring up the pressing surface to a thorough equality. A regard to all these circumstances constitutes the duty of a pressman. Bad printing is usually a result of old and worn types, want of proper cleaning, and an inferior kind of ink.

Printing by hand-presses of an improved kind con-

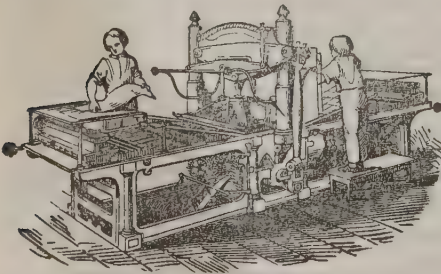

Fig. 3.—Flat-pressure Machine.

tinues to be used in the case of limited impressions, or where extra care and elegance in typography

are required; also where machinery is unattainable; but in general circumstances, and more particularly to meet the demand for popular reading, printing is now executed by one or other of the varieties of cylinder-presses, moved by steam-power. Attempts have indeed been made to introduce flat-pressure machines, by which as many as 700 sides can be printed per hour; but these, though possessing the advantage of superseding severe bodily labour, and demanding only the services of a boy to lay on and another to take off the sheets, have never become common. We offer a representation of a machine of this kind, made by J. Brown & Co., engineers, Kirkcaldy. More success, as regards flat-pressure machines, has been attained in the United States, where much fine work is provided by a clever adaptation of this kind, particularly in New York, Boston, and Philadelphia. No flat pressure, however, can compete, in point of speed, with the pressure which is communicated by revolving iron cylinders.

Cylinder-printing is the great modern fact in the history of the art, progress in which department has been facilitated by the invention of inking rollers made of a certain composition, to supersede the old process of inking by stuffed balls (see *ROLLERS*). In 1790, Mr Nicholson, the editor of the *Philosophical Journal*, procured a patent for certain improvements in printing, which patent embodies almost every principle since so successfully applied to printing-machines; and although he did not carry his views into practical effect, little has been left for subsequent engineers to do, but to apply, in the most judicious manner, the principles he laid down in his patent. Whether Mr Nicholson's ideas were known to Mr König, a German, is now uncertain; but to him is due the distinguished merit of carrying steam-printing first into effect. Arriving in London about 1804, he first projected improvements on the common press; but after a while, he turned his attention to cylinder-printing. The first result of his experiments was a small machine, in which the two leading features of Nicholson's invention were embraced (the cylinders and the inking-rollers), which he exhibited to Mr Walter, proprietor of the *Times* newspaper; and on shewing what further improvements were contemplated, an agreement was entered into for the erection of two machines for printing that journal. Accordingly, on the 28th of November 1814, the public were apprised that the number of the *Times* of that date was the first ever printed by machinery, steam-propelled. At this period, but few persons knew of any attempts going on for the attainment of this object; whilst among those connected with printing, it had often been talked of, but treated as chimerical.

After the utility of cylindrical printing had been thus proved, it was thought highly desirable that the principle should be applied to printing fine book-work, where accurate register is indispensable. This was, to a certain extent, attained by using two large cylinders, the sheet of paper being conveyed from the bottom of the first cylinder (where it had received the first impression) by means of tapes, leading in a diagonal direction to the top of the second cylinder, round which the sheet was carried till the second side was printed. The first machine of this description was erected at Mr Bensley's office, where it continued at work for some years, till more modern machines superseded it.

In the course of 1818, Messrs Applegath and Cowper took out a patent for improvements in cylindrical printing machinery. The chief improvements were, the application of two drums placed betwixt the cylinders to insure accuracy in the

register, over and under which the sheet was conveyed in its progress from one cylinder to the other, instead of being carried, as in König's machine, in a straight line from the one cylinder to the other; and the mode of distributing the ink upon tables instead of rollers—two principles which have secured to machines of this construction a decided preference for fine work. Machines of this construction were made by Applegath and Cowper for the principal printing establishments in London, Paris, Edinburgh, and many other cities; and it is nearly upon the model of their machines that other manufacturers now construct their steam-presses for the execution of ordinary book-work. Printing-machines may be divided into two distinct classes—those for printing book-work, in which register is required, and those for printing newspapers, in which register is not sought for, and speed is of first consequence.

Applegath and Cowper's book-machine, as just mentioned, remains the best of its kind. The machine, moved by steam-power, from which the annexed engraving is taken, is one of this description. It is about 15 feet long by 5 broad, and consists of a very strong cast-iron frame-work, secured

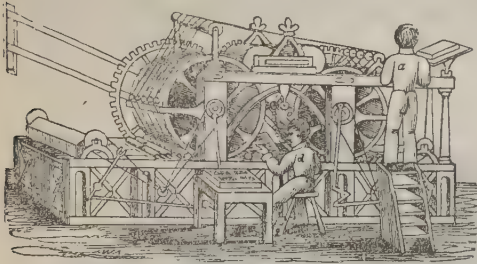

Fig. 4.—Book-Machine.

together by two ends and several cross-bars. To this frame, all parts of the machine are fixed. In external figure, as seen in the cut, it is a large apparatus, of imposing appearance. On approaching it when at work, we perceive two cylinders, as large as hogheads, revolving on upright supports; two smaller cylinders or drums revolving above them; and beneath, within the framework, a table, on which lie the types at both ends, going constantly backward and forward. A belt from a steam-engine, acting upon a shaft in the frame, gives motion to the whole apparatus. It will further be observed that a boy, marked *a* in the cut, is standing on the top of some steps feeding in sheets of paper, each of which, on being delivered, is swept round the first cylinder *b* (being held on by tapes), gets its impression below from the types, is carried over and betwixt the drums above, and then brought round on the second cylinder *c*; now it gets its second side printed, and issuing into the space between the cylinders, is seized by the boy *d*, who lays it on a table completely printed. The whole operation is accompanied with a loud noise, from the revolving of the cylinders, the working of the notched wheels, and the driving of the table to and fro by a rack beneath, but without any strain on the mechanism, or risk of injury to the attendants. On minutely examining the parts, we observe that at each end there is an apparatus of rollers taking ink from a ductor or reservoir of that material, and placing it upon a portion of the moving table beneath; here other rollers distribute it, while others take it off and roll it upon the pages of types, ready for each impression.

The two printing cylinders are nearly nine feet in

circumference each, and are placed about two feet apart. They are accurately turned, so that the surfaces of the type-carriages and the cylinders may be perfectly parallel. The axis of each cylinder works in brass bearings in the upright framework, where, by means of screws, the degree of pressure with which the cylinders are allowed to rest upon the types may be regulated to any degree of nicety. Over about two feet of the circumference of each cylinder which forms the printing-surface, two folds of cloth, called blankets, are stretched by means of rollers placed inside the cylinder. The lower blanket is seldom changed, but the upper one, on the second cylinder (which stands in the stead of what are called slip-sheets in hand-press printing), must be shifted as soon as the ink which it has absorbed from the printing on the first side of the sheet begins to set off, or soil the paper, when receiving the second impression. This shifting is speedily effected, by unrolling a sufficient quantity of the cloth off one roller, and winding it up on the other, to present a clean portion to the printing surface.

The cylinders have a continuous rotary motion towards each other, given by two large toothed wheels, whilst the type-carriages move backward and forward under them. The movements are so contrived that the type-carriages shall have gone and returned to the same point during the period that the cylinders have made one entire revolution; consequently, each successive impression is taken from the types by the same part of each cylinder. The two drums placed between the cylinders are for the purpose of causing the sheet of paper to pass smoothly and accurately from one printing cylinder to the other. To preserve the sheet in its proper place on the cylinders, and carry it forward through the different parts of its journey from the hand of the one boy to that of the other, there is an extensive apparatus of tapes, some of which are observable in the cut. These tapes are half an inch broad, and are formed into series of endless bands, arranged at certain distances apart, so as to fall into the interstices and margins of the forms, and therefore escape being crushed between the types and cylinders. The machine may be stopped at any instant by turning the handle of a lever, which shifts the belt from the fast to a loose pulley, without stopping the engine.—Such is the form of the machine that has printed the present work, which may be taken as a fair specimen of what this kind of press can, with carefulness, produce, at the rate of 700 sheets complete per hour.

Non-registering machines for rapid printing are of various kinds, according to the degree of speed which is demanded. In those first introduced, the principle was that of pressure by a cylinder on a form of types laid upon a table, which was passed beneath it by a forward and retrograde motion; the inking being effected as in the above described perfecting machines. Having received one side by this means, the sheets were afterwards printed on the second side; such second impression containing the news up till the latest hour of going to press. This species of single cylinder printing-machine was well adapted for newspapers of which only a few thousand copies were wanted; and for this purpose, it is still in use, particularly in provincial towns in Great Britain. As presses of this sort, however, do not usually yield more than 4000 or 5000 impressions per hour, they are quite unfitted for printing newspapers having a circulation of 20,000 copies and upwards, the whole of which must be promptly produced by a certain hour every morning. The liberation of newspapers from the obligatory penny-stamp in 1855, caused so great an increase of

circulation, that none of the ordinary processes, including that just referred to, was at all adequate for the work required. Recourse had to be made to an entirely new method of printing, the invention of which is due to Richard M. Hoe of New York.

Hoe's process consists in placing the types on a horizontal cylinder, revolving on its axis, against which the sheets are pressed by exterior and smaller cylinders. A similar process, by means of an upright cylinder, had been employed by Mr Applegath for printing the *Times* in 1848; but the expense involved in its construction and working prevented it coming into general use. Hoe's process was therefore the first successful attempt to print on this singularly ingenious and effective principle. As types must necessarily stand on a flat surface, in order to be held together and properly printed, it will seem incomprehensible how they should be built up on the exterior of an iron drum, and there yield legible impressions. Yet, this is done by Hoe's process. The pages of type are arranged in segments of a circle, each segment forming a frame that can be fixed on the cylinder. These frames are technically called *turtles*. Each column of type stands on a level strip of the turtle, while between the columns the brass rules for printing the lines are of a

bevelled shape—the bevel corresponding to the convexity of the turtle; so that by means of this bevelling, the form of type is susceptible of being tightened up and made ready for press. The forms occupy only a portion of the main cylinder, the remainder affording space for the inking apparatus. The smaller surrounding cylinders for effecting the pressure are arranged in a frame-work, in connection with slopes, by which the sheets are fed in blank, and come out printed. The size of the main cylinder, the number of exterior cylinders, and the rate of speed at which the whole machine is kept working, determine the number of impressions printed per hour. Such is the method of working Hoe's rotary machines, which, as wanted, are made with 2, 4, 6, 8, or 10 subsidiary cylinders; those of the largest dimensions being now employed in printing the daily newspapers in New York. The first introduced into Europe (with the exception of one made for the Paris newspaper, *La Patrie*, in 1848) was one with six cylinders for printing *Lloyd's Weekly Newspaper* in London, in 1857. Upwards of forty of these machines, of different sizes, are now in operation in London, Manchester, Liverpool, Leeds, Birmingham, Edinburgh, Glasgow, and other cities in Great Britain, where cheap daily

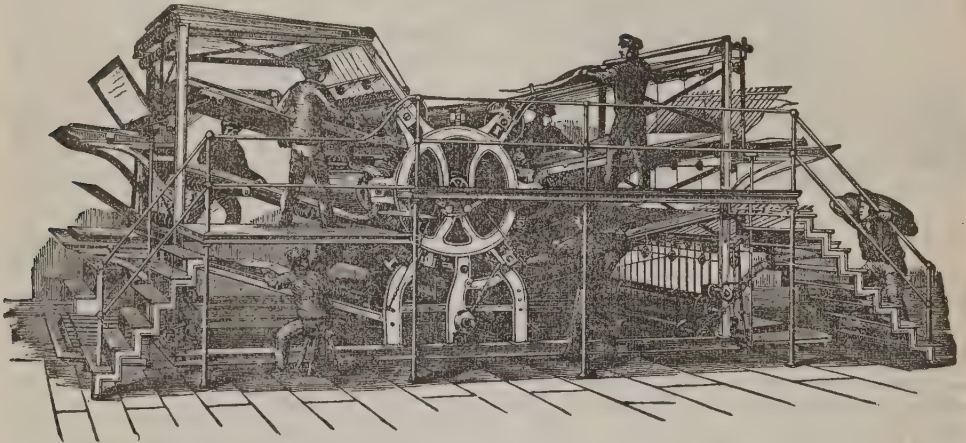

Fig. 5.—Hoe's Machine.

newspapers are produced. Some idea of the process of working may be obtained from the annexed cut, representing a rotary machine with six cylinders, which is employed, along with two of larger dimensions (viz., one with 8, and another with 10 cylinders), in printing the *Manchester Examiner and Times*. The working of the six-cylinder machine is thus described: 'The large cylinder being put in motion, the type imbedded in it is carried, successively, to the six impression-cylinders, which are placed horizontally to the large one, and arranged at proper distances around it. These subsidiary cylinders give the impression to six sheets of paper introduced, one at each cylinder. For each impression-cylinder there are two inking-rollers, which revolve on the distributing surface, and take up a supply of ink, and, at the proper moment, pass over the type, giving it the requisite amount of ink, after which they again fall to the distributing surface. Six persons are required to feed in the sheets, which, after receiving the impression, are carried out, by means of tapes, to the end of the machine, and laid regularly in heaps by self-acting flyers. In order to produce 12,240 impressions in

one hour, each feeder must lay in sheets at the rate of 34 per minute, or 2040 per hour. In each revolution of the large cylinder, therefore, six sheets receive each its impression; and as it moves, say, at the rate of 34 revolutions in a minute, 204 impressions are necessarily produced, giving in 60 minutes, or one hour, 12,240 impressions. In the 8 and 10 cylinder machines, the number of impressions produced per hour would be, respectively, 16,320, and 20,400; but the larger machines are not run at so great a speed as 34 revolutions per minute, and the actual number produced is, therefore, rather less. The productive power of the machine is only limited by the skill and dexterity of the feeders or layers-on. In the *New York Herald* printing-office, the manipulative power of the feeders has been so much increased by practice, that 2500 is by no means an unusual number of sheets to be laid on by each workman in an hour. Applying this to the six-cylinder machine, and supposing the main cylinder to revolve at the rate of 42 revolutions per minute, with six skilful feeders, each capable of laying on 42 sheets in a minute, it follows that 252 impressions would be produced;

and as the number of revolutions performed in one hour would be 2520, the aggregate number of impressions produced within the hour would amount to 15,120.' A machine of this kind can be set up for about £3500; one with eight cylinders, for £4500; and with ten cylinders, for £5500. By machines with ten cylinders, such as those now used in printing the *London Times*, *Daily Telegraph*, *Morning Star*, *Standard*, and *Manchester Examiner and Times*, as many as 20,000 impressions can be thrown off per hour. But to this is to be added another marvel in typography. By taking a stereotype-cast of the forms when ready for press, which can be done in a few minutes, two sets of types, so to speak, are produced, from which duplication as many as 40,000 impressions can be taken in the hour; it being, in fact, by this means that the proprietors of the *Times* and other popular prints are able to supply, at an early hour every morning, the extensive demand for their papers. See STEREOTYPING; also P. in SUPPLEMENT in Vol. X.

The most remarkable of all the printing machines hitherto invented is that of William Bullock, of Philadelphia. Like the Hoe machine, it carries the forms upon the cylinder, but differs therefrom in several important particulars. In the Bullock press automatic-feeding is substituted for hand-feeding, and the paper is introduced into the machine, after it has been subjected to a moistening operation by passing through a shower of fine spray, in the form of a roll containing several thousand sheets, and the printing operation, including the cutting into proper lengths, proceeds uninterruptedly until the roll is exhausted, at the rate of from 8000 to 14,000 per hour, or, counting both sides, 16,000 to 28,000 impressions. The only labour required is that of placing the roll on the press and removing the printed paper. Excellent book-printing has been done on this machine at the government office at Washington, at the rate of 200,000 octavo pages in a single hour, printing with a perfect register. These presses are employed on some of the prominent newspapers of Philadelphia and New York. Bullock's press promises to effect a revolution in the art of printing, as its capacity for the rapid production of printed sheets is unequalled, its cost comparatively small, and the space required for setting it up also but moderate. The economy of attendance is a very important item for consideration, as two men can do the work to perform which 12 men were formerly required. See *Rep. of U. S. Com. to Paris Univ. Exhib.*, 1867, Washington, 1870. Various other novel projects have been suggested for facilitating the art of letter-press printing, to notice which would exceed the space at our disposal.

Anastatic Printing (so called from *anastasis*, resuscitation, raising up again) originated in Germany about 1840, and is the process of executing impressions from zinc-plates to which an impression has been transferred from existing printed books or sheets. The first step in the process is to damp a printed sheet with water, and then moisten it with dilute nitric acid, after which the sheet is pressed firmly and evenly on a prepared zinc-plate. The acid now eats out the plate in all parts except where there is print, which, from its oleaginous character, has absorbed neither water nor acid. The result, after due time, is the production of a typographic surface on the plate, somewhat resembling the appearance of stereotype, and from which may be printed a fac-simile of the original. This very ingenious process, which has been made the subject of a patent in Great Britain, may be rendered available for procuring fac-simile copies of books and prints, but is not likely ever to be carried to a great length in competition with fresh typography. Recently-printed matter is most easily

transferred; with old books, the transfer is effected with difficulty, and only by exercising a degree of care which ordinary operators are not disposed to take.

PRINTING, NATURE. See NATURE-PRINTING.

PRINT-WORKS, in British law, are regulated by the statute 8 and 9 Vict., c. 29, so far as regards the labour of children, young persons, and women; and the statute applies to all buildings where persons are employed to print figures, patterns, or designs by means of blocks or cylinders, &c., on any woven fabric of cotton, wool, hair, fur, silk, flax, hemp, or jute. The works are subject to the inspection of the factories' inspectors, to whom particulars of the business and place are to be duly sent. Children under 8 years of age are not to be employed. Surgical certificates of age are to be given. No child under 13, or female, is to be employed during the night. Children under 13 must be sent by the parent to school for at least 60 days in the year, and certificates of these school attendances must be obtained before a child can be employed in a print-work. A register is to be kept of all the persons employed, and the times of employment; and any employment of a child, young person, or woman contrary to the act, subjects the occupier of the works to a penalty. Minute regulations for securing observance of the act are contained in the act itself.

PRIOR. See MONASTERY.

PRIOR, MATTHEW, an English poet, was born, it is supposed, in London, where his father was a joiner, on the 21st July 1664. He was educated, through the liberality of an uncle, at Westminster School; and in 1682, he was sent by the Earl of Dorset, whose friendship he had formed, to St John's College, Cambridge. Here he took his B.A., obtained a fellowship, and made the acquaintance of Charles Montagu, afterwards Earl of Halifax, in conjunction with whom he produced *The City Mouse and Country Mouse*, written to ridicule Dryden, in which it did not in the least succeed, although it lives yet in virtue of its own wit, polish, and grace.

After 1688, P. was introduced to court by the Earl of Dorset, and was appointed secretary to the embassy which was sent to the Hague in 1690. His conduct gave satisfaction to King William; and the lucky and well-mannered poet was appointed afterwards to several posts of a similar description. He was a favourite at the courts of Holland and France. In 1701, P. entered parliament; and soon after he deserted the Whigs, and went over to the Tory party. In 1711, he was sent by government to Paris with private proposals for peace, and on his return, he brought with him one of the French ministers, who was invested with full powers to treat. At P.'s house, shortly after, the representatives of the British government met the French plenipotentiary; and his connection with this meeting was made the ground of a charge of treason, on which he was committed to prison, but released after a confinement of two years, without a trial. He had now nothing to live by except his fellowship and his wits. The publication of his poems by subscription, however, brought him 4000 guineas; and at the same time, Lord Harley, son of the Earl of Oxford, bought a small estate in Essex, and conferred it on him for life. At the age of 57, he died at the seat of the Earl of Oxford, September 18, 1721. A monument was erected to him in Westminster Abbey.

P. was one of the few poets who was also a diplomatist and man of the world. He filled his public offices with credit to himself, and he had the knack of making friends amongst those who had the giving

of places and pensions. His poems, which comprise odes, songs, epistles, epigrams, and tales, are not much read. He has no fire, no enthusiasm, but everything is neat, pointed, well turned; and his lighter pieces are graceful and witty. If there is little inspiration in his verse, there are the polish and felicity of a scholar and man of society.

PRISCIAN (Lat. *Priscianus*), surnamed **CÆSARIENSIS**, either because he was born or educated in the town of Cæsarea, is perhaps, in point of reputation, the first of Latin grammarians, though one of the last in point of time. He belongs to the middle of the 5th c., if he is not even considerably later, for he is mentioned by Paulus Diaconus as a contemporary of Cassiodorus (468—562 A.D.). He taught Latin at Constantinople, probably to the imperial court, for he enjoyed a government salary. The work which has mainly preserved his name is his *Commentariorum Grammaticorum Libri XVIII.*, dedicated to his patron the consul Julianus. The first 16 books treat of the different parts of speech as conceived by the ancients; the remaining two are devoted to syntax, and in one MS. bear the separate title of *De Constructione libri duo*. P.'s Commentary is, for the time, a solid and comprehensive work, the production of a man of great learning and good sense, and is enriched with quotations from many Greek and Latin authors no longer extant. The epitome executed by the German bishop, Rabanus Maurus (flor. in the 9th c.), was very popular in the middle ages. Besides the Commentary, P. wrote six smaller grammatical treatises, and two hexameter poems of the didactic sort, *De Laude Imperatoris Anastasii*, and a free translation of the *Periegesis* of Dionysius. The first edition of P. appeared at Venice (1470); the best is that by Krehl (2 vols., Leip. 1819—1820).—The phrase, 'to break the head of Priscian,' means to grossly violate the rules of grammar.

PRISCILLIAN, the author, or rather the chief propagator in Spain, during the latter part of the 4th c., of the doctrines professed by the sect known from his name as **PRISCILLIANISTS**. The first seed of their doctrines is said to have been carried into Spain by a Memphian named Marcus. P. was a man of noble birth; and by his eloquence and ascetic life obtained so much consideration, that a numerous party, including some priests, and at least two bishops, attached themselves to his school. His doctrine was substantially that of the Manichæans (q. v.). He taught expressly the *Dualism* and the *Docetism* of that sect, and it is equally certain that he adopted the moral consequences as to marriage, &c., by which they had rendered themselves obnoxious even to the civil authorities in the East and Africa. He was warmly opposed by two bishops, Idacius and Ithacius; and the council of Cæsar-Augusta (Sagossa) having in the year 380 condemned his doctrines, a decree for his banishment was issued in the same year. He not only obtained, however, a reversal of this decree, but succeeded in effecting the banishment of his chief opponent, Ithacius. By an appeal to the usurper Maximus at Treves, Ithacius caused P. and several of his followers to be brought to trial, and put to death, in 385; a proceeding which was regarded with so much abhorrence by St Martin of Tours, St Ambrose, and other bishops, that they separated from the communion of Ithacius. The sect did not die out with its founder, though there was a considerable reaction against it at the close of the 4th c.; and at all times through the mediæval period we find its traces under various names and forms, especially in the north of Spain, in Languedoc, and in Northern Italy.

PRISM, in Geometry, a solid figure which can

be most easily conceived of if we imagine a number of plane figures (triangles, quadrilaterals, &c.) exactly similar in form and size to be cut out of paper or any thin plate, and piled one above the other, and then the whole pile to become one body. It will thus be seen that the top and bottom of the prism are similar, equal, and parallel to each other, and that the sides are plane figures, rectangular if the prism be 'right' (i. e., if in the above illustration the pile of plane figures be built up perpendicularly), and rhomboidal if the prism be 'oblique' (i. e., if the pile slope to one side); but under all circumstances the sides of a prism must be parallelograms. The top and bottom faces may be either triangles, squares, parallelograms, or quadrilaterals of any sort, or figures of 5, 6, 7, &c. sides, provided only both are alike; and the number of sides in the plane figure which forms the top or bottom, of course determines the number of faces of the prism; thus, in a triangular prism, there are 5 faces in all (3 sides and 2 ends); in a quadrangular prism, 6 faces (4 sides and 2 ends), &c. If two prisms, one being 'right,' and the other 'oblique,' have their bases of equal area, and be of the same vertical height, their solid content is the same, and is found by multiplying the area of the base by the vertical height. The *Parallelopiped* (q. v.) is a quadrangular prism, and the *cube* is a particular case of the parallelopiped.—**PRISM**, in Optics, is a triangular prism of glass or other transparent substance, its two ends being isosceles triangles, and having most frequently a very acute vertical angle, which gives the prism the appearance of a long wedge. The prism is a most important instrument in experiments on the refraction of light, and, in the hands of the most eminent optical philosophers, has been the means of largely adding to the science of optics. See **REFRACTION**.

PRISON DISCIPLINE means the method in which criminals, or other persons subjected to imprisonment are managed. In this, which is its original sense, prison discipline, as actually practised, may be good or bad in the estimation of the person speaking of it. Of late, however, the term has obtained a new meaning, having been used to express not merely the practice of ruling prisons, but the science of properly ruling them. It has gone even further, and sometimes has been used to express the principles of penal administration, or the philosophy and practice of punishment. This has arisen from the circumstance, that gradually other punishments have been dropped in England and America, and detention within edifices and the grounds attached to them has become almost the only method of punishment for crimes. Torture, exposure in the pillory, and other like dedications of the offender to public vengeance, have been long abandoned as barbarous. Death-punishment has been much narrowed in its application; and transportation, apart from any question as to its effectiveness, has been rendered impracticable, except within a very narrow compass. We get nothing from the practice of the times anterior to Christianity, nor yet from that of the middle ages, to help us in estimating modern systems of prison discipline. They are a development of civilisation; and, contradictory as it may seem to say so, of personal liberty. The institution of slavery renders any such system unnecessary. It removes the function of punishing ordinary criminals from the public administration of the affairs of a state, and places it in private hands. Hence, we have no criminal law, properly speaking, coming down to us from antiquity. The *corpus juris*, so full of minute regulations in all matters of civic right, has very little criminal law, because the criminals became slaves,

and ceased to be objects of the attention of the law. When imprisonment became a function of the state in the administration of justice, it was often carelessly, and hence tyrannically, exercised, because the practice of awarding it as a punishment arose more rapidly than the organisation for controlling its use. On several occasions, grave abuses have been exposed by parliamentary inquiries and otherwise in the practice of prison discipline in this country. The exertions of Howard, Mrs Fry, and other investigators awakened in the public mind the question, whether any practice in which the public interest was so much involved, should be left to something like mere chance—to the negligence of local authorities, and the personal disposition of jailers. The tendency lately has been to regulate prison discipline with extreme care. The public sometimes complain that too much pains is bestowed on it—that criminals are not worthy of having clean well-ventilated apartments, wholesome food, skilful medical attendance, industrial training, and education, as they now have in this country. There are many arguments in favour of criminals being so treated, and the objections urged against such treatment, are held by those who are best acquainted with the subject to be invalid; for it has never been maintained by any one that a course of crime has been commenced and pursued for the purpose of enjoying the advantages of imprisonment. Perhaps those who chiefly promoted the several prominent systems expected from them greater results, in the shape of the reformation of criminals, than any that have been obtained. If they have been disappointed in this, it can, at all events, be said that any prison in the now recognised system is no longer like the older prisons, an institution in which the young criminals advance into the rank of proficient, and the old improve each other's skill by mutual communication. The system now received is that of separation, so far as it is practicable. Two other systems were tried—the silent system and the solitary system. The former imposed entire silence among the prisoners even when assembled together; the latter endeavoured to accomplish their complete isolation from sight of or communication with their race. By the separate system, the criminals are prohibited from communicating with each other; but they are visited by various persons with whom intercourse is more likely to elevate than to debase—as chaplains, teachers, scripture-readers, the superior officers of the prison, and those who have the external control over it. See PENTITENTIARIES.

PRISONERS OF WAR are those who are captured from the enemy during naval or military operations. By the laws or recognised principles of war, the entire people of a vanquished town, state, or nation become the absolute property of the victors; but civilisation has greatly modified this stern rule, and, except when a country is devastated for military reasons, it is rare for non-combatant citizens to be subjected to penalties of conquest, beyond the levying of contributions in money or provisions. The combatants who have laid down their arms become prisoners of war. Their lives and liberty are at the disposal of their conquerors, and even in modern times, their lives are sometimes taken, as, for instance, when Napoleon put the Turkish prisoners to death at Jaffa in 1799; otherwise, prisoners of war are kept in confinement until peace ensues, or they are exchanged for prisoners of their conqueror's nation, held in captivity by their own countrymen. It is unusual to subject prisoners of war to penal discipline; but the loss of liberty and hard fare (for, of course, they are allowed no more than a bare subsistence) render captivity

sufficiently irksome. In ancient times, the treatment of prisoners of war was far more severe. In the Greek wars, it was no uncommon thing to put the whole adult male population of a conquered state to the sword, while the women and children were enslaved. Although the putting to death of prisoners became less frequent, they and their families were commonly reduced to slavery to as recent a period as the 13th century. About that time, the more humane custom of exchanging prisoners came into practice. Notwithstanding frequent exchanges, large numbers of prisoners accumulate during war. In 1811, about 47,600 French were prisoners in England, while 10,300 English languished in the prisons of France. See PAROLE.

PRISREND, a town of European Turkey, in the eyalet of Uskup (Albania), on the Rieka, 80 miles east of Scutari. It is one of the most beautiful, rich, and industrious towns in Turkey, with a citadel situated upwards of 1100 feet above sea-level. It contains an immense number of bazaars, and carries on an active trade in flints, saddlery, glass, copper, and steel wares. Among its edifices are 15 mosques. Pop. 25,000.

PRISTI'NA, a town of European Turkey, in the eyalet of Uskup, 30 miles north-north-east of Prisrend, stands on a hill, and is the most considerable town in Old Servia. Pop. 11,000.

PRISTIS. See SAWFISH.

PRITHU is the name of several legendary kings of ancient India. It is, however, especially one king of this name who is the favourite hero of the Purāṇas. His father was Ven'a, who perished through his wickedness; for when he was inaugurated monarch of the earth, he caused it to be everywhere proclaimed that no worship should be performed, no oblations offered, and no gifts bestowed upon the Brahmins. The R'shis, or Saints, hearing of this proclamation, entreated the king to revoke it, but in vain; hence they fell upon him, and slew him. But the kingdom now being without a king, as Ven'a had left no offspring, and the people being without protection, the sages assembled, and consulted how to produce a son from the body of the dead king. First, then, they rubbed his thigh; from it, thus rubbed, came forth a being called Nishāda; and by this means the wickedness of Ven'a having been expelled, they proceeded to rub the right arm of the dead king, and by this friction engendered P., who came forth resplendent in person, and in his right hand the mark of the discus of Vishnu, which proved him to be a universal emperor, one whose power would be invincible even by the gods. The mighty P. soon removed the grievances of the people; he protected the earth, performed many sacrifices, and gave liberal gifts to the Brahmins. On being informed that, in the interval in which the earth was without a king, all vegetable products had been withheld, and that, consequently, the people had perished, he in great wrath marched forward to assail the earth. The earth, assuming the figure of a cow, fled before him; but seeing no escape from the power of the king, at last submitted to him, and promised to renew her fertility, provided that he made all places level. P. therefore uprooted mountains, levelled the surface of the earth, established boundaries of towns and villages, and induced his subjects to take up their abode where the ground was made level. The earth now fulfilled her promise; and as P., by thus granting her new life, became, as it were, her father, she was henceforth called Prithivī. However little the worth of this piece of popular etymology—for *prithivī*, or *prithvi*, 'earth,' the feminine of *prithu* (Greek *platui*) means etymologically

'the large' or 'wide'—the legend of P. itself seems to record some historical fact regarding the civilising influences exerted by a great king of Hindu antiquity.

PRIVATE, the title applied in the British army to a common soldier of the cavalry and infantry; the corresponding rank in the artillery being gunner or driver, and in the engineers, the sapper. The pay of a private is one shilling a day in the infantry, and 1s. 3d. in the cavalry—exclusive, in each case, of one penny a day for beer-money. A private in the cavalry is sometimes called a trooper.

PRIVATEER, a ship owned by a private individual, which, under government permission, expressed by a Letter of Marque (q. v.), makes war upon the shipping of a hostile power. To make war upon an enemy without this commission, or upon the shipping of a nation not specified in it, is piracy. Privateering was abolished by mutual agreement among European nations by the Treaty of Paris in 1856. It is doubtful, however, how far that abolition would stand in a general war, for privateering is the natural resource of a nation whose regular navy is too weak to make head against the maritime power of the enemy, especially when the latter offers the temptation of a wealthy commerce.

PRIVET (*Ligustrum*), a genus of plants of the natural order *Oleaceae*, containing a number of species of shrubs and small trees with opposite leaves, which are simple and entire at the margin; the flowers small, white, and in terminal panicles; the calyx slightly 4-toothed; the corolla funnel-shaped and 4-cleft; the stamens two, projecting beyond the tube of the corolla; the berries 2-celled. **COMMON P.** (*L. vulgare*) is a shrub growing in bushy places and about the borders of woods in the middle and south of Europe, and in some parts of Britain, now also naturalised in some parts of North America. It has half-evergreen, smooth, lanceolate leaves; and berries about the size of peas, black, rarely white, yellow, or green. The flowers have a strong and sweetish smell; the leaves are mildly astringent, and were formerly used in medicine; the berries, which hang on the shrub during winter, have a disagreeable taste, but serve as food for many kinds of birds; they are used for dyeing red, and with various additions, green, blue, and black. A rose-coloured pigment obtained from them is used for colouring maps. The wood is hard, and is used by turners, and by shoemakers for making wooden pegs. P., although not spiny, is much used for hedges, often mixed with some spiny shrub, or with beech. It bears clipping well, and grows well in the smoke of towns, also under the shade of trees. —A number of species of P. are natives of different parts of the East, and some of them have begun to be introduced into shrubberies in Britain.—All kinds of P. grow readily from cuttings.

PRIVILEGE (Lat. *privilegium*, from *privata lex*, a private law), a special ordinance or regulation, in virtue of which an individual or a class enjoys certain immunities or rights from or beyond the common provisions of the general law of the community. It differs from a *dispensation* inasmuch as the latter merely relaxes the existing law for a particular case or cases, while the privilege is a permanent and general right. Of ancient and medieval legislation, the law of privilege formed an important branch; and, in truth, the condition of the so-called 'privileged classes' was in all respects different, socially, civilly, and even religiously, from that of the non-privileged. In canon law, there were two privileges enjoyed by the clergy, which deserve especial notice, from the

frequency of the historical allusions to them—the 'privilege of the canon' (*privilegium canonis*) and the 'privilege of the forum' (*privilegium fori*). By the former, the person of the clergyman, of whatever degree, was protected from violence by the penalty of excommunication against the offender; by the latter—known in England as 'benefit of clergy' (q. v.)—the clergyman was exempted from the ordinary civil tribunals, and could only be tried in the ecclesiastical court. Most of the purely civil privileges are abolished throughout Europe by modern legislation.

PRIVILEGED DEBTS, in the Law of Scotland, such debts as are first paid out of certain funds. Thus, when a man dies, a certain sum is allowed out of his estate for Mournings (q. v.) to the widow and children. In case of bankruptcy, servants' wages are privileged to a certain extent. —**PRIVILEGED DEEDS** are holograph deeds, which are exempted from the statute which requires other deeds to be signed before witnesses.

PRIVY-CHAMBER, **GENTLEMEN OF THE**, officers of the royal household of England, instituted by King Henry VII., to attend on the king and queen at court, and in their progresses, divorcements, &c. For a number of years past, no services have been required of these officers, and no salary or fee is attached to the office. There are also four Gentlemen Ushers of the Privy-chamber, who are in regular attendance on the sovereign, waiting in the Presence-chamber, and attending on the royal person; they have the honour of conducting her Majesty, in the absence of the higher officers.

PRIVY-COUNCIL (*consilium regis privatum*), an assembly of advisers on matters of state appointed by the sovereign. The Privy-council of England existed at a very early period in the history of the country. It was in its beginning a small permanent committee, or minor council, selected by the king out of the great council, or parliament; and in its powers were included—what still forms one of its functions—the right to inquire into all offences against the state, and to commit offenders for trial before the proper courts of law. It also frequently assumed the cognizance of questions of private right, a practice against which the statute 16 Charles I. c. 10 was directed, enacting that neither king nor council should have any jurisdiction in matters regarding the estates and liberties of the subject, which should be tried in the ordinary tribunals of the country. The Council in early times consisted of the Chancellor, the Treasurer, the Justices of either bench, the Escheaters, the Serjeants, some of the principal Clerks of the Chancery, and other members nominated by the king, who were generally bishops, earls, and barons. The Star-chamber and Court of Requests were both committees of Privy-council. The number of members, which had originally been 12, was gradually increased; and when the large number had become inconvenient, the sovereign sought the advice of a select body of the more influential among them. Charles II. limited the number of councillors to 30, 15 of whom comprised the chief officers of state and the *ex officio* members, to whom were added 10 peers and 5 commoners named by the sovereign; and it was intended that the Council, thus remodelled, should practically resume its original duties, and have the control of every part of the executive administration. The Court of Privy-council has, however, long ceased to discharge the function of advising the crown on the general affairs of government and state policy, a select number of the body, under the denomination of the Cabinet Council, forming the recognised executive council of the crown. See **MINISTRY**. The

list of privy-councillors now includes the members of the royal family, the Archbishops of Canterbury and York, the Bishop of London, the great officers of state, the Lord Chancellor and judges of the Courts of Equity, the Chief Justices of the Courts of Common Law, the Ecclesiastical and Admiralty Judges, and the Judge Advocate, several of the Puisne Judges, the Speaker of the House of Commons, the Ambassadors, some of the Ministers Plenipotentiary and Governors of Colonies, the Commander-in-chief, the Master-general of the Ordnance, the First Lord of the Admiralty, and generally also a Junior Lord of the Admiralty, as well as necessarily all the members of the Cabinet. The Vice-president of the Board of Trade, the Paymaster of the Forces, and the President of the Poor-law Board, are also generally members of the Privy-council; and sometimes other persons who have filled responsible offices under the crown. It is now understood that no members attend the deliberations of Council except those who are especially summoned. In ordinary cases, only the ministers, the great officers of the Household, and the Archbishop of Canterbury, are summoned; but on some extraordinary occasions, summonses are sent to the whole Council—this was last done to receive her Majesty's communication of her intended marriage. Meetings of Council are usually held at intervals of three or four weeks at her Majesty's residence; and the attendance of six privy-councillors at least, with one of the clerks of Council, is considered necessary to constitute a council.

A privy-councillor must be a natural-born subject of Great Britain. The office is conferred by the sovereign's nomination, without any patent or grant, and completed by taking the oath of office. The duties of a privy-councillor, as defined by this oath, are—to the best of his discretion, duly and impartially to advise the king; to keep secret his counsel; to avoid corruption; to strengthen the king's council in all that by them is thought good for the king and his land; to withstand those who attempt the contrary, and to do all that a true councillor ought to do to his sovereign lord. The office of privy-councillor formerly fell by the demise of the crown; but by 6 Anne, c. 7, the Privy-council continues to exist for six months longer, unless sooner determined by the successor. Immediately on the decease of the sovereign, the Privy-council now assembles and proclaims his successor, the Lord Chancellor affixing the Great Seal to the proclamation. The members of the Privy-council are then re-sworn as council of the successor, and take the oath of allegiance, after which a privy-council is held, and the sovereign makes a declaration of his designs for the good government of the realm, and subscribes the requisite oaths.

The king in Council, or a committee of the Lords of Council, have been empowered by various statutes to issue orders which are to have the force of law, parliament thus delegating its authority to regulate such matters as may be more conveniently regulated by Order in Council. In cases of extreme public emergency, at a time when parliament was not sitting, Orders in Council have sometimes been issued in contravention of the existing law, and the indemnification of parliament has afterwards been sought. See ORDERS IN COUNCIL. The sovereign, with the advice of the Privy-council, is also empowered to issue proclamations, which, however, must be in accordance with, and in furtherance of, the law of the land. See PROCLAMATION.

Almost every act of importance done by the sovereign in person is performed in Council—such as declarations of, or public engagements by, the sovereign, and consent to marriages by members

of the royal family. Among the functions of the Privy-council are also the appointment of sheriffs in England and Wales, and the issuing of orders for the laying on or removing of quarantine, or for granting reprisals, or for embargoes. The sovereign in Council has still more ample authority in all that relates to the colonies, including the making and enforcing of laws in such colonies as have no representative assemblies; and approving or disallowing the legislative acts of such as do possess them.

A large part of the business of the Privy-council is transacted by committees, to which petitions and other matters are submitted by the queen in Council. Among the permanent committees of Privy-council are the Board of Council for Trade and Foreign Plantations (see TRADE, BOARD OF); the Committee of Council for Education, appointed in 1839, to distribute the sum voted annually for educational purposes; and the Judicial Committee of Privy-council. This last-named committee consists of the Keeper of the Great Seal, the Chief Justices, the Master of the Rolls, the Chief Baron and other great judicial officers, with any two other privy-councillors who may be named by the sovereign. It was established by 3 and 4 Will. IV. c. 41, for the purpose of deciding certain questions of right or privilege, particularly with regard to the colonies, and hearing appeals in certain classes of cases, which, notwithstanding the above-cited act of Charles I., still fell under the jurisdiction of the Privy-council. Among these are appeals from the Courts of Equity, colonial appeals both at Common Law and in Equity, as also those causes which, prior to its abolition by 2 and 3 Will. IV. c. 92, were reviewed by the Court of Delegates (see DELEGATES, COURT OF), as the supreme court of appeal in ecclesiastical and maritime cases. The powers of the judicial committee of the Privy-council have been enlarged and regulated by 6 and 7 Vict. c. 38. The powers possessed by the General Board of Health, instituted by 11 and 12 Vict. c. 18, and 17 and 18 Vict. c. 95, are now, by 21 and 22 Vict. c. 97, vested in the Privy-council. The acts of committees of the Privy-council are designated Acts of the Lords of the Council, in contradistinction from Orders in Council, made by the sovereign, who is personally present, by advice of the Privy-council. The crown may refer to a Committee of Council any petition or claim of right for which the ordinary tribunals afford no remedy. The Lords of Council constitute a Court of Record for the investigation of offences against the state, the offenders being committed for trial before the ordinary tribunals. Certain state investigations, not of a criminal kind, have also been held to fall within their jurisdiction, such as the inquiry into the insanity of George III., the claim of Queen Caroline to be crowned as consort of George IV., and questions regarding alleged illegal marriages of the royal family.

The Privy-council is styled collectively 'Her Majesty's most Honourable Privy-council.' Privy-councillors are entitled to the designation 'Right Honourable' prefixed to their name, and take precedence next after Knights of the Garter. The personal security of a member of Privy-council was formerly guarded by certain statutes, visiting with fine a blow struck in his house or presence, and making it felony to conspire against him or assault him in the execution of his office; but these immunities were done away with by 9 Geo. IV. c. 31.

The Lord President of the Council is the fourth great officer of state, and is appointed by letters-patent under the Great Seal. The office is very

ancient, and was revived by Charles II. in favour of the Earl of Shaftesbury.

Scotland possessed a Privy-council, which was merged in that of England by 6 Anne, c. 6. There is a Privy-council for Ireland, which at present consists of 58 members, who are sworn pursuant to a sign-manual warrant directed to the Lord Lieutenant.

PRIVY-COUNCIL (COMMITTEE OF) ON EDUCATION. Till within the last forty years, popular or primary education in England was left in the hands of individuals and societies. The only Societies of importance which endeavoured to overtake the enormous educational destitution which prevailed, were the British and Foreign School Society, founded under the patronage of George III.; and the National Society, of more recent date. The first-mentioned Society endeavoured to get rid of all religious difficulties by avoiding the use of catechisms in the school, and confining themselves to the use of the Bible alone. The Church party, however, felt that in accepting for the children of the country a religious training so vague, they were untrue to their principles, and would probably fail to secure for the young any efficient religious instruction at all. Accordingly, the National Society was set on foot as a specially Church institution. The object of both these Societies was, by means of contributions collected from benevolent persons, to aid in the foundation and maintenance of elementary schools throughout England and Wales.

The prevailing destitution was, however, too widespread to be met by voluntary associations, and it consequently became necessary that the State should take some share in the education of the people. Parliamentary grants of small amount were made, which were distributed by the Treasury under regulations issued in 1833, the chief of which was as follows: 'That no application be entertained by the Treasury unless a sum be raised by private contribution equal, at least, to one-half of the total estimated expenditure.' These grants were for the purpose of erecting school-buildings. In 1839, after considerable opposition, it was resolved to increase the parliamentary grant, and to appoint a Committee of Her Majesty's Privy-council to administer it. On the 3d June 1839, an order of Council laid down, that the grants of previous years not yet appropriated, as well as the grant for the current year, should be expended for the erection of schools, and that £10,000 voted for Normal Schools in 1835 should be given in equal proportions to the British and Foreign and the National Societies. The Privy-council Committee did not at first contemplate aiding any schools but those in connection with the two Societies which we have just named; but in September of 1839, they resolved to aid other schools, where special circumstances prevented their affiliation to the Societies. In the course of a year or two it came practically to this, that *all schools* were aided in which the Bible was daily read from the authorised version.

The various religious denominations, under the influence, partly, of the strong pecuniary inducement held out by the Committee of Council, now began to exert themselves to erect schools, and to claim state aid. The Committee of Council, seeing the large probable increase in the number of schools requiring to be maintained partially out of the state funds, had their attention specially directed to the principles of their administration, and the conditions on which alone aid was to be granted. The first measure of importance was the appointment of inspectors of schools. These were appointed by Her Majesty; but the Church

of England was permitted to exercise a veto on those nominated for the inspection of Church schools, and the dissenting education committees were allowed a similar privilege with reference to those nominated for dissenting schools. No school was to be admitted to government aid in any form which did not declare its willingness to submit to inspection. The next measure of importance was the determining of the conditions on which aid should be given, first, for the erection, and, secondly, for the maintenance of schools. Grants for the former purpose were given in proportion to the number of children to be educated and the amount of money raised by private contribution.

In 1846, the first step seems to have been made towards making grants for the maintenance of schools. It was resolved to apprentice promising boys to their teachers—these boys to give assistance in the school-work, and to be paid annual stipends by government. The masters were to give special instruction to these boys in terms of a programme drawn up by the Committee of Council, and they were to be paid a small sum per annum for discharging this duty. At the same time, it was resolved to distribute gratuities annually among deserving teachers.

The course of instruction for these apprentices, who were to be designated pupil-teachers, extended over five years, and their remuneration was arranged as follows: First year, £10; second, £12, 10s.; third, £15; fourth, £17, 10s.; fifth, £20. To schools taught by the humbler class of teachers, stipendiary monitors were allowed at a smaller rate of stipend.

In contemplation of the close of the apprenticeship of pupil-teachers, it was further resolved to grant them a scholarship or bursary, to enable them to pursue their studies at one of the numerous male and female normal schools which had come into existence; and at the conclusion of their training, to allow a grant of money to the normal school to which they had resorted. The Queen's Scholarship, as the bursary was called, was fixed at £20; and the grants to the normal school at £20, £25, and £30, according as they had trained the student for one, two, or three years—two-thirds of these sums being allowed in the case of female students. It was further necessary to contemplate the completion of the normal-school training, and to endeavour to secure for the public service the well-trained teachers who had been educated at the public expense. Accordingly, it was resolved to grant to teachers sums ranging from £15 to £30 per annum (and two-thirds of these sums in the case of females), provided the school-buildings in which they taught, and the character of their teaching, were satisfactory to Her Majesty's inspectors. A condition, afterwards added, was, that the teacher should receive from local sources, including school-fees, not less than twice the amount paid by government, of which one-half should be from voluntary subscriptions. The amount which the teacher might claim, besides being payable only on the conditions stated above, was made partially dependent on the grade of certificate obtained at the normal school. The certificate was, and still continues to be, granted on the student's passing a satisfactory examination in all the subjects taught in elementary schools, in addition to physical geography, and either mathematics or Latin.

These are the principles of administration which have continued to regulate the actions of the Privy-council, both as to the class of schools aided and the manner of aiding them, up to the present date. The consequence has been an astonishingly rapid increase in the number of primary schools and

normal schools or colleges; of the latter, there are about 40 in England and Scotland.

About 1862, a new code was introduced, which came into full operation in June 1863. The provisions of this code were suggested by a Royal Commission, appointed to inquire into the state of primary instruction. They reported a want of sufficient attention in elementary schools to the younger children and to the more elementary branches. It had so happened that, in 1853, a Minute had been issued by the Privy-council enabling schools to claim, in addition to the augmentation of teachers' salaries referred to above, a capitation fee for every child who had attended 176 days in the course of the year. Accordingly, with a view to simplify their administration, and to render it more efficient, the Privy-council, by the New or Revised Code, resolved to pay henceforth only in the form of capitation grants (a system already partially adopted), a sum of 12s. for each child, subject to a deduction of 2s. 8d. for every child who fails in reading; and similar deductions for those who fail in writing and arithmetic.

Since the passage of the Elementary Education Bill, in 1870, G. Britain has become the responsible agent and the primary motive power in the great work of instruction. By this statute, England is now divided into school districts, which correspond with parliamentary divisions, boroughs, and parishes, in each of which it is required that a sufficient amount of public elementary school accommodation shall be provided for all the children resident in such district. School-boards are to be chosen by the qualified electors, in whom the management is to be vested, each school being a body corporate, having perpetual succession, &c. Each child attending must pay a weekly fee, which, in case of poverty, may be remitted in whole or in part. School-boards may also establish free schools, and may build and maintain industrial schools. It is expressly provided that 'no religious catechism or religious formula which is distinctive of any particular denomination shall be taught,' and in those schools any religious observance or instruction on religious subjects is to be given at the beginning or end of the secular teaching of the day, and any scholar may be withdrawn during the time without forfeiting the other benefits of the school. The House of Commons shewed a resolute opposition to the exclusion of religion from the state system of education by a vote of 421 to 60. The funds of the schools are to be supplied by fees from the children, local rating, and grants by parliament.

PRIVY-PURSE, KEEPER OF THE, an officer of the royal household charged with the payment of the private expenses and charities of the sovereign. He is independent of the great officers of the household, and has no control over any official or household charges. The office is of modern creation.

PRIVY-SEAL, the seal appended to grants which are afterwards to pass the Great Seal, and to documents of minor importance which do not require the Great Seal. The officer who has the custody of the Privy-seal was at one time called the Keeper, and afterwards the Lord Privy-seal. As early as the reign of Edward III., he was a member of the king's council, and a responsible minister of the crown. The Lord Privy-seal is now the fifth great officer of state, and has generally a seat in the cabinet. His office is conferred under the Great Seal during pleasure. Since the reign of Henry VIII., the Privy-seal has been the warrant of the legality of grants from the crown, and the authority for the Lord Chancellor to affix the Great Seal. Such grants are styled letters-patent, and the office of the Lord Privy-seal is one of the

departments through which they must pass to secure their validity. Until recently, all letters-patent for the grant of appointments to office under the crown, of patents of invention, charters, naturalisations, pensions, creation of honours, pardons, licenses in mortmain, &c., required to pass from the Signet Office to the Privy-seal Office, in the form of Signet bills, verified by the Signet Seal and superscription, and the signature of the clerk of the Signet. These Signet bills were the warrant for the Privy-seal; and on the Privy-seal being attached to them, they were forwarded to the Lord Chancellor, by whom the patents were engrossed and completed in the office of the Great Seal. The statute 11 and 12 Vict. c. 82, abolished the Signet Office, and enacted that warrants under the royal sign-manual, prepared by the Attorney-general and Solicitor-general, setting forth the tenor and effect of the letters-patent to be granted, addressed to the Lord Chancellor, and countersigned by one of the principal secretaries of state, should be a sufficient authority for the Privy-seal being affixed.

PRIZE, PRIZE-MONEY, terms referring to an enemy's property captured in time of war. When a ship is taken, she must be sent to a port, under charge of a competent prize-master, for adjudication. If condemned, the prize must be sold at public auction, unless appropriated for the use of the government.

The provisions for the distribution of prize-money in the courts of the United States, according to the law of June 30, 1864, are substantially as follows: 1. When the captures are made by public armed ships of ships of the enemy of force equal or superior to that of the captors, the proceeds belong wholly to the captors, otherwise they are equally divided between them and the United States.

The prize-money adjudged to the captors is distributed in the following proportions, namely, 1. To the commanding officer of a fleet or squadron, one-twentieth. 2. To the commanding officer of a division of a fleet, and under orders of the commander-in-chief of such fleet, one-fiftieth of any prize-money awarded to a vessel of such division for a capture made under his command. 3. To the fleet-captain, one-hundredth part of all prize-money awarded to any vessel or vessels of the fleet, except the capture be made by the vessel in which he is serving, when he shall share in proportion to his pay. 4. To the commander of a single ship, one-tenth of all the prize-money awarded to the ship under his command if acting under the commanding officer of a fleet or squadron or a division, and three-twentieths if his ship were acting independently of his superior officer. 5. After the foregoing deductions, the residue shall be distributed among all others doing duty on board (including the fleet-captain), in proportion to their respective rates of pay in the service.

One or more efficient vessels of the navy within signal distance share equally in the prize or prizes. A bounty of \$100 shall be paid for each person on board the vessel sunk or destroyed in an engagement, if of inferior force, and \$200 if superior to the captors or destroyers, to be drawn as prize-money. The prizes taken by privateers shall be decreed to the captors unless otherwise provided in the commission to such vessels.

PRIZE-COURT is a court which adjudicates the property in vessels captured at sea from a belligerent; and the rule is, that when a captor brings home a prize, the tribunal of his own country has jurisdiction to declare whether he is entitled to it, which decision is binding everywhere. A prize-court differs from other courts in this, that the property of foreigners is brought within its jurisdiction, not by consent, as is implied with regard to the ordinary municipal courts, but by force. By

natural law, one would suppose that the tribunals of the captor's country are no more the rightful exclusive judges of captures in war, made on the high seas from under the neutral flag, than are the tribunals of the neutral country. Nevertheless, such is the rule of international law, which vests this jurisdiction in the prize-court. In Britain, the court is created by commission under the Great Seal, and the judge of the Admiralty Court is usually appointed. In the U. States any District Court may appoint prize commissioners, who must take charge of all documents relative to the prizes within their jurisdiction, and prepare evidence for the action of the court.

PRO'A, commonly known as the 'flying proa,' is a peculiarly-shaped canoe in use by the natives of the Eastern Archipelago, and especially by the Ladrone pirates. It is about 30 feet in length by 3 in width, and has the stem and stern equally sharp, so as to sail backward or forward without being turned round. One side is flat, and in a

Proa.

straight line with the stem and stern; the other side is rounded, as in ordinary boats. This peculiar formation would make it liable to be easily upset, were it not for a framework which projects to windward, supporting a weight which counterbalances the pressure of the wind on the sail. The sail resembles the ordinary lug-sail, and is formed of mat. Slight variations from this form are found, but the principle of construction is the same.

PRO'BABILISM (Lat. *probabilismus*, a barbarous technical word, from *probabilis*, probable), in Roman Catholic theology, means the doctrine regarding the use of so-called 'probable opinions' in guiding the conscience as to the lawfulness or unlawfulness of any particular action. The word came prominently into discussion in the 17th c., and seems now fully accepted as a technical name. As the ground of the doctrine, it is assumed that, in human actions, absolute certainty is not always attainable as to their lawfulness or unlawfulness. Short of this certainty, the intellect passes through the stages of 'doubt' and of 'probability.' In the former, it is swayed between conflicting views, so as to be unable to decide, or even to approach towards deciding, what is true. In the latter, although there is a conflict of views, yet the reasons in their favour are not so equal that the intellect cannot see preponderating motives in favour of the truth of one or of the other. Moreover, in the conflict of views, another element will arise, as to their comparative 'safety,' that is,

the greater or less danger of moral culpability which they involve; and this greater or less moral 'safety' of a view may, or may not, coincide with its greater or less 'probability.' The doctrine of 'probabilism' is founded upon these distinctions; and it presents itself in four different schools, all of which agree in professing that it is lawful, in certain cases, to act upon opinions which are merely 'probable.' Opposed to all these four, is the school of *Anti-probabilism*, which rejects altogether the use of probable opinions, and requires that an opinion shall be absolutely morally certain, in order that it may be lawful to act upon it. The four schools of probabilism are called: *Probabilism Simple*, *Equiprobabilism*, *Probabiliorism* (from *probabilior*, more probable), and *Tutorism* (from *tutor*, more safe). The first holds that it is lawful to act upon any probable opinion, no matter how slight its probability. The second requires that the opinion shall be 'solidly probable,' but holds that, provided it be really probable, it is lawful to act upon it, even though the conflicting opinion should be equally probable. The third, in the conflict of probable opinions, will only permit us to act on the more probable of the two; but permits this even when the less probable adverse opinion is the 'more safe.' The fourth requires that in all cases the more safe opinion shall be followed, even when the less safe opinion is much the more probable. It is commonly said that the system of probabilism is modern; but this is only true of the discussions regarding it, for the doctrine itself, in some of its forms, is as old as the study of ethics, even considered as a moral science. The disputes regarding it arose with the science of casuistry, when men, in the 16th and 17th centuries, began to reduce morals to a system. It formed a leading subject of the controversy between the Jesuits and the Jansenists, although it is a great, while it is a very common, mistake to suppose that all the Jesuits were probabilists, and that all the Jansenists were opposed thereto. Very few Jesuits, indeed, were of the school which is chiefly assailed in the *Provincial Letters* (see PASCAL), that of Probabilism Simple. Without entering into the history of this very curious controversy, it will be enough to say that the Roman Church, while condemning the two extremes—the extreme of anti-probabilism, which excludes all use even of the most probable opinions, and the lax extreme of simple probabilism, which accepts even the slightest probability as sufficient—has left the intermediate opinions for free discussion. The great modern master on the subject is St Alfonso de Liguori, whose system may be described as a kind of practical probabiliorism, in which, by the use of what are called reflex principles, an opinion which *objectively* is but probable, is made *subjectively* the basis of a certain and safe practical judgment. There can be no doubt that the system of probabilism has been pushed by some individual divines to scandalous extremes; but it is only just to add that these extremes have been condemned by authority in the Roman Church; and that, on the other hand, the principles of the higher Roman schools of probabilism are substantially the same as those of all moralists, whether of the old or of the new schools of ethics.

Protestants, however, and with them some Roman Catholics, reprobate probabilism in all its schools or forms, as a mere scheme for the delusion of conscience and excuse or justification of immorality. They maintain the Scriptural or Christian rule, and the only rule of true morality, to be that no man is entitled on any account to do that of which he doubts whether it is contrary or agreeable

to the law of God. Every man must often choose between two courses, as to which is the more expedient; but this they hold to be a totally different thing. It is also urged against the probabilists, that they make the authority of *doctors*, or learned theologians, sufficient justification for a man's doing that which otherwise he would deem it unlawful to do; asserting that it will keep him safe at the judgment seat of God.

PROBABILITY, THE MATHEMATICAL THEORY OF. Of all mathematical theories which can be made in any sense popular, this is perhaps the least generally understood. There are several reasons for this curious fact, of which we may mention one or two. *First*.—As by far the simplest and most direct elementary illustrations of its principles are furnished by games of chance, these have been almost invariably used by writers on the subject; and the result has been a popular delusion, to the effect that the theory tends directly to the encouragement of gambling. Nothing can be more false than such an idea. Independent of moral considerations, with which we have nothing to do here, no arguments against gambling can be furnished at all comparable in power with those deduced from the mathematical analysis of the chances of the game. *Second*.—In many problems, some of them amongst the easiest in the theory, the very highest resources of mathematics are taxed in order to furnish a solution. One reason is very simple. The solutions, however elementary, involving often nothing but the common rules of arithmetic, sometimes lead to results depending upon enormous numbers, and very refined analysis is requisite to deduce *easily* from these what would otherwise involve calculations, simple enough in character, but of appalling labour. Higher mathematics here perform, in fact, something analogous to *skilled labour* in ordinary manufactures. The simplest illustration of this is in the use of LOGARITHMS (q. v.), which reduce multiplication, division, and extraction of roots to mere addition, subtraction, and division respectively. Powerful as logarithms are, analysis furnishes instruments almost infinitely more powerful. The large numbers which occur in probabilities are usually in the form of *products*, and we may exemplify the above remarks as follows.

To find the value of the product 1.3.5.7, no one would think of using anything but common arithmetic; but, if he were required to find the value of 1.3.5.7.9.....49, he would probably have recourse to logarithms, *merely to avoid useless labour of an elementary kind*. But in very simple questions in probabilities, it may be requisite to find (approximately) the value of a product such as 1.3.5.7.9.....23999—i. e., that of the first 12,000 odd numbers. No one in his senses would dream of attempting this by ordinary arithmetic, but it is the mere labour, not the inherent difficulty, which prevents him. Few would even attempt it by means of logarithms; for, even with their aid, the labour would be very great. It is here that the higher analysis steps in, and helps us *easily* to a sufficiently accurate approximation to the value of this enormous number. Thus, it appears that this objection to the study of the theory of probabilities is not applicable to their principles, which are very elementary, but to the mere mechanical details of the processes of solution of certain problems. *Third*.—There are other objections, such as the (so-called) religious one, that 'there is no such thing as chance,' and that 'to calculate chances is to deny the existence of an all-ruling Providence,' &c.; but, like many other similar assertions, these are founded on a total

ignorance of the nature of the science; and, therefore, although pernicious, may be safely treated with merited contempt. The authors of such objections remind us of the Irishman who attempted to smash Lord Rosse's great telescope, because 'it is irreligious to pry into the mysteries of nature.'

It appears to us that the best method of explaining the principles of the subject within our necessarily narrow limits, will be to introduce definitions, &c., as they may be called for, in the course of a few elementary illustrations, instead of elaborately premising them.

First Case.—The simplest possible illustrations are supplied by the common process of 'tossing' a coin, with the result of 'head' or 'tail.' Put H for head, and T for tail. Now, the result of one toss, unless the coin should fall on its edge (which is practically impossible), *must* be either

H or T.

Also, if the coin be not so fashioned as to be more likely to fall on one side than the other (as, for instance, is the case with loaded dice), *these events are equally likely*; or, in technical language, *equally probable*. To determine numerically the likelihood or the probability of either, we must assign some numerical value to *absolute certainty*. This value is usually taken as *unity*, so that a probability, if short of absolute certainty, is always represented by a proper fraction. Suppose that *p* (a proper fraction) represents the probability of H, then evidently *p* is also the probability of T, because the two events are equally likely. But one or other *must* happen; hence, the sum of the separate probabilities must represent certainty. That is,

$$p + p = 1, \text{ or } p = \frac{1}{2}$$

Thus we have assigned a numerical value to the probability of either H or T, by finding what proportion each bears to certainty, and assigning to the latter a simple numerical value.

Suppose, as a contrast, the coin to be an unfair one, such as those sometimes made for swindling purposes, with H on each side. Then we *must* have in one toss

H or H;

i. e., H is *certain*, or its probability is 1. There is no possibility of T, and therefore its probability is 0. Absolute impossibility is therefore represented by the numerical value of the probability becoming zero.

Second Case.—Suppose a 'fair' coin to be tossed twice in succession. The event *must* be one of the four—

H, H; H, T; T, H; or T, T.

Now all four are evidently equally likely; i. e., their probabilities are equal. But one of them *must* happen—hence the sum of their probabilities amounts to certainty, or 1. That is, each of the four cases has a probability measured by the

$$\text{fraction } \frac{1}{4}$$

Here we may introduce a new term. What are the *odds* against H, H? The answer is, the chance or probability of H, H is $\frac{1}{4}$; that is, *one case in four* is favourable, hence *three* are unfavourable, and the odds are said to be 3 to 1 against the event. *In general the odds against any event is the ratio of the probability that it will not, to the probability that it will, happen.*

Thus, in the first case above, the odds against H in one toss are even.

Third Case.—What is the chance of throwing both head and tail in two tosses of a coin? Remark that this is *not* the same question as, 'What is the

chance of head followed by tail, in two tosses? The latter question was answered in the *Second Case*, for the chance of H, T was there shewn to be $\frac{1}{4}$. The present event contemplates either H, T or T, H—and its probability is therefore $\frac{1}{4} + \frac{1}{4}$ or $\frac{1}{2}$, since each has the separate probability $\frac{1}{4}$. Or we may reason thus: Of the four possible cases of two tosses of a coin, two give both head and tail—all four are equally probable—hence the probability is $\frac{2}{4}$, or $\frac{1}{2}$; i. e., $\frac{1}{2}$.

Fourth Case.—What is the chance of throwing H in two tosses? Remark that this is *not* the same question as, 'What is the chance of H *once only* in two tosses?' The latter question is that of the Third Case merely put in a different form. Nor will it do to answer our question thus:

$$\text{Chance of H in first throw} = \frac{1}{2},$$

$$\text{Chance of H in second throw} = \frac{1}{2},$$

$$\text{Therefore chance of H in two throws} = \frac{1}{2} + \frac{1}{2} = 1.$$

For by this reasoning it would appear that we *must* get head once at least in two throws; which is obviously absurd, for we may have T, T.

This very elementary example shews how delicate the reasoning in this subject is, and how liable one is to make (complacently) the most preposterous mistakes.

The error of the above process is introduced by the fact, that we have not considered that *if H be obtained in the first throw, our object is attained, and no second throw is required.* The correct work is this—

$$\text{Chance of H in first throw} = \frac{1}{2}.$$

If H come, the game is finished.

$$\begin{array}{l} \text{Chance of T in the first throw, in which} \\ \text{case we must throw again,} \\ \text{Subsequent chance of H in second throw} \end{array} = \left. \begin{array}{l} \frac{1}{2} \\ \frac{1}{2} \end{array} \right\}$$

Combining these, we have—

$$\text{Chance of H at second throw only} = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}.$$

$$\text{Add chance of H at first throw} = \frac{1}{2}.$$

$$\text{Sum, or chance of H in two throws} = \frac{3}{4}.$$

A simpler method is this. The possible throws, all equally likely, are, as before—

H, H; H, T; T, H; and T, T.

The first three of these satisfy the requirements of the question; i. e., the required event has 3 chances in 4 in its favour, or its probability is $\frac{3}{4}$.

Fifth Case.—The chance of H in any one throw is $\frac{1}{2}$ (by *First Case*). The chance of H, H is $\frac{1}{4}$ (*Second*

Case). Now $\frac{1}{4} = \frac{1}{2} \times \frac{1}{2}$; i. e., the chance of the joint occurrence of two independent events, at least in this simple case, is the product of their separate probabilities. Contrast this with the principle, already several times employed, that the probability of an event which may arise from one of a number of causes (no two of which can coexist), is the sum of the

separate probabilities. Simple proofs of these statements, in all their generality, will now be given, along with various other important propositions.

(A.) If an event may occur in p ways, and fail in q ways—all being equally likely—the probability of its happening in one trial is $\frac{p}{p+q}$, and of its failing,

$$\frac{q}{p+q} \text{—and the odds in its favour are } p:q.$$

The simplest way of conceiving this, and many other hypothetical cases, is to suppose one ball to be drawn from a bag which contains a number of balls, differing from each other in colour, or in some other quality not distinguishable by the touch. Suppose the bag to contain p white balls (W), and q black ones (B), and one ball to be drawn; what is the chance of its being white?

Here there are p chances in favour of a white ball being drawn, and q chances against it—these being all equally likely, or having equal probabilities—the chance of W is therefore p in $p+q$; i. e., is expressed by the fraction,

$$\frac{p}{p+q}.$$

The chance against W is q in $p+q$, or

$$\frac{q}{p+q}.$$

And the sum of these fractions is 1, or certainty, as it ought to be—for the ball drawn *must* be either W, or not W.

(B.) If an event may occur in p ways, and fail in q ways, all being equally likely—what are the chances of (a) its happening twice, (b) its happening the first, and failing the second, (c) its failing the first time, and happening the second, and (d) its failing twice, in two trials?

Taking the illustration in (A) above, we see that there are p independent ways of succeeding in the first case, and p in the second; hence, there are $p \times p$, or p^2 independent ways of *succeeding twice*. For any one of the first p may occur along with any one of the second. But the whole possible number of ways of experimenting twice is $(p+q)(p+q)$, or $(p+q)^2$; hence, the

$$\text{Chance of (a) i.e. succeeding twice, is } \frac{p^2}{(p+q)^2}.$$

$$\text{Similarly, chance of (b) is } \frac{pq}{(p+q)^2}.$$

$$\text{" " " (c) is } \frac{qp}{(p+q)^2}.$$

$$\text{" " " (d) is } \frac{q^2}{(p+q)^2}.$$

$$\text{The sum of these is } \frac{p^2 + 2pq + q^2}{(p+q)^2} = 1, \text{ as it ought.}$$

(C.) An attentive consideration of (B) shews us that when we have the independent probabilities of two events, the probability that they will jointly occur is the *product* of their separate probabilities.

$$\text{Thus, for W, in first trial, chance is } \frac{p}{p+q}.$$

$$\text{" " second " " " " } \frac{p}{p+q}.$$

Whose product is $\frac{p^2}{(p+q)^2}$; the probability of W in each of two successive trials.

$$\text{Again, for W, in the first trial, chance is } \frac{p}{p+q}.$$

$$\text{" B " second " " " " } \frac{q}{p+q}.$$

Whose product is $\frac{pq}{(p+q)^2}$, which is found above to be the chance of WB. And so on.

(D.) This may be generalised as follows—the process will be evident to all who can understand the very elementary algebra employed:

$$\text{Certainty} = 1 = \frac{(p+q)^n}{(p+q)^n} =$$

$$p^n + np^{n-1}q + \frac{n \cdot n-1}{1 \cdot 2} p^{n-2} q^2 + \dots + q^n$$

by the Binomial (q. v) Theorem of Newton. Now the parts of this expression—i. e.,

$$\frac{p^n}{(p+q)^n}, \frac{np^{n-1}q}{(p+q)^n}, \dots, \frac{q^n}{(p+q)^n}$$

represent, obviously, the chances of W n times, W $n-1$ times and B once, W $n-2$ times and B twice,, B n times, in n trials, where the order of occurrence is not considered.

If the order be considered, the chance of any arrangement, such as WBWWBBBW, for instance, is evidently

$$\frac{p \cdot q \cdot p \cdot p \cdot q \cdot q \cdot q \cdot p}{(p+q)^8} = \frac{p^4 q^4}{(p+q)^8}$$

But the chance of 4W and 4B in 8 trials, *without respect to order*, is as above, the term containing $p^4 q^4$ in the expansion of $(p+q)^8$, divided by $(p+q)^8$ —i. e.,

$$\frac{70 p^4 q^4}{(p+q)^8}$$

To take a simple example: if there be 2W and 1B in a bag, and each ball be replaced immediately after drawing, the chance of W 4 times in succession is $\frac{2^4}{3^4} = \frac{16}{81}$.

Of the particular combination WBWB, the chance is $\frac{2}{3} \cdot \frac{1}{3} \cdot \frac{2}{3} \cdot \frac{1}{3} = \frac{4}{81}$.

But the chance of W twice and B twice, *without respect to order*, is $6 \cdot \frac{2^2 \cdot 1^2}{3^4} = \frac{24}{81}$; the numerator of the fraction being the term of $(2+1)^4$ which contains the product $2^2 \cdot 1^2$.

(E.) From the preceding results it is obvious that the probability of the joint occurrence of any set of independent events is the product of their separate probabilities.

(F.) We may vary the process by supposing that there are several bags, each containing some balls, which may be white or black; but the number in each bag, and the proportion of white to black, being any whatever. One ball only is to be drawn, what is the chance that it is W?

If n be the number of bags, the chance that the ball will be drawn from any particular bag is $\frac{1}{n}$ [see (A)]. And if in that bag there be p of W and q of B, the chance that W will be drawn from it is $\frac{p}{p+q}$ [see (A)]. Hence the chance that W is drawn, and from the particular bag, is,

$$\frac{1}{n} \cdot \frac{p}{p+q} \text{ by (E).}$$

And the whole chance that W is drawn is the sum of all the chances, $\frac{1}{n} \cdot \frac{p}{p+q}$, for each of the bags.

Thus, let there be 5 bags, containing, respectively, WB, WW, BB, WWB, WWW; our chance is

found as follows: The chance of the ball being drawn from any particular bag is $\frac{1}{5}$, since all are equally likely to be chosen. Then, supposing the first chosen, the chance of W is $\frac{1}{2}$; if the third be chosen, the chance of W is 0, &c. Hence, on the whole, the chance of W is

$$\frac{1}{5} \cdot \frac{1}{2} + \frac{1}{5} \cdot 1 + \frac{1}{5} \cdot 0 + \frac{1}{5} \cdot \frac{2}{3} + \frac{1}{5} \cdot 1 = \frac{19}{30}$$

(G.) Hence, if an event may happen in consequence of any one of a set of causes, such that the action of one excludes that of the others; its probability is the sum of the products formed by multiplying the chance of the action of each cause by the chance that that cause, if operating, will produce the desired event.

We might easily extend this very simple series of results, but our limits restrict us to an attempt to shew more the extent of the subject than the details of its application to any particular set of questions. We therefore reluctantly pass to the consideration of an inverse problem or two.

(H.) An event has occurred, which may have arisen from any one of a set of mutually exclusive causes: to determine the probability that any particular cause was the efficient one—the probability of the event's happening, when any particular one of the causes operates, being known.

As a simple example will shew us how to proceed in the most general case, take the 5 bags of (F) above. The chances of drawing W from them are, in order, $\frac{1}{2}, 1, 0, \frac{2}{3}, 1$. Suppose W has been drawn, what is the chance that it was drawn from any particular bag? It is obvious that the chance of W having been drawn from any particular bag is proportional to the chance that, if that bag had been selected, W would have been drawn from it. Hence, if p_1, p_2, p_3, p_4, p_5 be the chances that the several bags furnished the W actually drawn, we have

$$p_1 : p_2 : p_3 : p_4 : p_5 :: \frac{1}{2} : 1 : 0 : \frac{2}{3} : 1,$$

with the additional condition, that the ball *must* have been drawn from one of the bags, and therefore

$$p_1 + p_2 + p_3 + p_4 + p_5 = 1.$$

From these, by elementary algebra, we have

$$p_1 = \frac{3}{19}, p_2 = \frac{6}{19}, p_3 = 0, p_4 = \frac{4}{19}, p_5 = \frac{6}{19}.$$

And a very simple application of algebra will easily conduct us to the general formula for any such case.

(I.) If the nature of a cause is known only by its results, we have an interesting case of simultaneous application of the direct and inverse methods.

Thus, a bag contains 3 balls, each of which may be either black or white. A ball has been drawn from it on two occasions—replacing before drawing—and on each of these occasions the ball was W. What is the chance that a third drawing will give a black ball?

The contents of the bag are obviously one of the following—viz., W,W,W; W,W,B; or W,B,B—since it contains *one* W at least. Now, if WWW be the contents, the probability of the observed event (two W in succession) is $1 \times 1 = 1$.

$$\text{If W,W,B, } \frac{2}{3} \times \frac{2}{3} = \frac{4}{9}.$$

$$\text{If W,B,B, } \frac{1}{3} \times \frac{1}{3} = \frac{1}{9}.$$

Hence the probabilities that these are, respectively, the contents of the bag are as $1 : \frac{4}{9} : \frac{1}{9}$, or as $9 : 4 : 1$; and are therefore $\frac{9}{14}, \frac{4}{14}$, and $\frac{1}{14}$ respectively, since their sum must be 1 or certainty.

Now for the chance of B in the third drawing; if WWW be the contents (of which the chance is $\frac{9}{14}$), the chance of B is 0. Hence we have one part of the chance for B, viz. $\frac{9}{14} \times 0 = 0$. Similarly, the other parts are $\frac{4}{14} \times \frac{1}{3} = \frac{4}{42}$, and $\frac{1}{14} \times \frac{2}{3} = \frac{2}{42}$. The whole chance of B in the third drawing is therefore $0 + \frac{4}{42} + \frac{2}{42} = \frac{1}{7}$.

As exercises on the above principles, we will take first a few simple questions from Life Assurance, the subject to which, above all others, the elementary theory of Probability has been of the most indispensable service. We purposely choose the very simplest that the subject can furnish, but they are quite sufficient to shew the great value of the theory.

A Table of Mortality (q. v.) gives the numbers alive at each successive year of their age, out of a given number of children born. If A_n and A_{n+1} be the numbers in the table corresponding to the n^{th} and $n+1^{\text{th}}$ years of age; the inference from the table is, that, of A_n individuals now alive, and of n years of age, A_{n+1} will live one additional year at least. Hence, the chance that any one of them die during the year is

$$\frac{A_n - A_{n+1}}{A_n}$$

Call this $1 - p$, then p is the chance that any one of them will survive the year.

Questions. Of two individuals, one n years old, and the other n_1 , what are the chances that

- Only one lives a year?
- One, at least, lives a year?
- Both do not live a year?

Calling the individuals A and B, the chance of A living out the year is p , and the chance of his dying within the year is $1 - p$. For B these are p_1 and $1 - p_1$. Hence

- A lives and B dies—chance $p(1 - p_1)$.
- B lives and A dies—chance $(1 - p)p_1$.

Hence answer to (a) is $p + p_1 - 2pp_1$.

(b) This includes, in addition to the conditions of (a), the chance that both survive, which is pp_1 .

Hence answer to (b) is $p + p_1 - pp_1$.

(c) In this case the chance that both do live a year is pp_1 . Hence chance of (c) is $1 - pp_1$.

As another very instructive example, let us take the question,

'In how many throws of a die is it even betting that an ace will be thrown?'

This may, of course, be worked directly, proceeding in the following manner:

$$\text{Chance of ace in first throw} = \frac{1}{6}$$

Then, remembering that there is no second throw unless the first fails,

Chance of ace in second throw = $\frac{5}{6} \cdot \frac{1}{6}$; and so on.

Hence the odds against ace in 1 throw are 5 : 1.

" " " " 2 throws 25 : 11; and so on. But great care is requisite in this mode of working the problem.

The simplest procedure is this :

Chance against ace in 1 throw	$\frac{5}{6}$.
" " " " 2 throws	$\frac{25}{36}$.
" " " " 3 " "	$\frac{125}{216}$.
" " " " 4 " "	$\frac{625}{1296}$.

Hence odds against ace in 1 throw	5 : 1.
" " " " 2 throws	25 : 11.
" " " " 3 " "	125 : 91.
" " " " 4 " "	625 : 671.

That is, the odds are considerably against ace occurring in three throws, being about 11 to 8; while in four they are slightly in its favour, as 29 : 27 nearly. One is sure, therefore, of winning in the long run, if he can get any one to give him repeatedly an even bet against ace appearing in four throws of a die.

It is to be observed that when we say 'in the long run,' we mean that the most likely event may not be that which will happen in the first trial, nor perhaps for many trials (because, unless its probability is 1 or certainty, it is, of course, possible that it may never occur). But what is certain is this, that if a sufficient number of trials be made, we can have any amount of probability (short of certainty) that the ratio of the number of successful trials to the number of failures, will be in the ratio expressed by the odds in favour of success in any one trial.

And this introduces us to another department of the theory of Probabilities, what is called *Expectation*. We begin with a simple case, not involving what is called *Moral Expectation*, to which the next example will be devoted.

Suppose A, B, and C have made a pool, each subscribing £1; and that a game of pure chance (i.e., not dependent on skill) is to be played by them for the £3. What is (previous to play) the value of the expectation of each? By the conditions, all are equally likely to win the pool, hence its contingent value must be the same to each; and, obviously, the sum of these values must represent the whole amount in question. The worth of the expectation of each is therefore £1. That is, if A wishes to retire from the game before it is played out, the fair price which B or C ought to pay him for his share

is simply £1. But this is obviously $\frac{1}{3} \times £3$; i.e.,

the value of the pool multiplied by his chance of getting it. Here we have taken an extremely simple case, because we have not room for the general proof (though it is closely analogous to that just given) that

The value of a contingent gain is the product of the sum to be gained into the chance of winning it.

So far, it has been assumed that the payment of his stake (which may be wholly lost) has not morally affected the position of any of the players; i.e., that the stake is a sum whose loss would in nowise embarrass him. And it is only with such cases that the strict mathematical theory can deal; for we cannot estimate with mathematical accuracy the value of the stake as depending on the fortune (the *possessions*, not the *luck*) of the player. The attempts which have been made to supply this apparent deficiency in the theory have, of course, not been very generally accepted. Still there is no doubt that two men of very unequal fortunes are placed in very different circumstances when they have subscribed equal sums to a pool which they have equal chances of gaining. The most commonly

received method of *approximating* to a solution of such a question (for it is obvious that here we have left mathematical certainty behind) is that proposed by Daniel Bernoulli; which is, that the value of a small gain, or the inconvenience of a small loss, is directly proportional to the amount of the gain or loss (which is probably correct), and inversely proportional to the fortune of the person affected (which may be nearly true, except in very extreme cases). The application of this hypothetical principle necessitates, in general, the use of the integral calculus; but, to shew the *mathematical folly* of gambling, we quote one of Bernoulli's results.

A, whose whole fortune is £100, bets £50 even with B on an event of which the chance is $\frac{1}{2}$. What is the moral value of A's fortune after making the bet (and before it is decided)? By applying the above method, he finds it to be £87. Thus A, by making the bet, has depreciated by 13 per cent. the value of his property. This is an extreme case, of course; and the method employed in obtaining the result is questionable; still, it is certain that no legitimate method could shew that A had otherwise than impaired his fortune by entering upon any such transaction. This, of course, is on the supposition that the bet is a *fair* one; if A be a swindler, and get from B more than the proper odds against the event, he may, of course, improve to any extent the value of his fortune. But such would be a question of flats and sharpers, not a question of probability.

A very excellent example of *moral* as distinguished from *mathematical* probability is furnished by the famous 'St Petersburg Problem.'

A and B play at heads and tails. A is to pay B £2 if H comes at the first throw, £4 if at the second and not before, £8 if at the third and not before; and so on, doubling each time. What should B pay (before the game) for his expectation?

Applying the mathematical method, we see that

$$\text{Chance of H at first throw} = \frac{1}{2};$$

in which case B gets £2, of which the contingent value is $\frac{1}{2} \times £2 = £1$.

$$\text{Chance of H at second throw, and not before} = \frac{1}{4};$$

when B is to get £4, whose value is therefore $\frac{1}{4} \times £4 = £1$.

$$\text{Chance of H at third throw, and not before} = \frac{1}{8};$$

contingent value of B's £8 is therefore $\frac{1}{8} \times £8 = £1$.

And so on, for ever.

Hence B's expectation (mathematical) is £1 + £1 + £1 + &c. for ever, or an infinite sum. Now it is obvious that no man, in his senses, would pay even a moderately large sum for such a chance. Here the *moral* expectation comes into play; but the mathematical solution is perfectly correct, if we interpret it properly. It does not attempt to tell what will be the actual result in any one game—this is *pure chance*—but it tells us what will be the average to which the results of larger and larger numbers of games must continually tend. In other words, if B had an inexhaustible purse, he might safely pay any amount to A before each game, and be sure of winning in the long run, after an indefinitely great number of games were played. But this, though theoretically exact, is not applicable to mundane gambling—where limited purses and limited time

circumscribe the field requisite for the proper development of the mathematical result.

Before quitting this part of the subject, we may give a couple of instances in which the mathematical theory may be easily tested by any one who has a little leisure. One of these we will develop at length, as a final instance of the simple calculations generally involved.

'To find the chance of throwing any given possible number with two dice.'

As the faces of the dice are numbered from 1 to 6—the smallest throw is 2, and the greatest 12.

In one throw, the chances are—

$$\text{For } 2 = 1 + 1; \frac{1}{6} \cdot \frac{1}{6} = \frac{1}{36};$$

the probabilities being multiplied (E) because the events are independent. For

$$3 = 1 + 2, \text{ or } 2 + 1; \frac{2}{36};$$

$$4 = 1 + 3, 2 + 2, \text{ or } 3 + 1; \frac{3}{36};$$

$$5 = 1 + 4, 2 + 3, 3 + 2, \text{ or } 4 + 1; \frac{4}{36};$$

$$6 = 1 + 5, 2 + 4, 3 + 3, 4 + 2, \text{ or } 5 + 1; \frac{5}{36};$$

$$7 = 1 + 6, 2 + 5, 3 + 4, 4 + 3, 5 + 2, \text{ or } 6 + 1; \frac{6}{36};$$

Then, in the inverse order—

$$8 = 2 + 6, 3 + 5, 4 + 4, 5 + 3, \text{ or } 6 + 2; \frac{5}{36};$$

and so on—the fact being that if we read the *lower* sides of the dice when the throw is 8, they will give 6, and so on—the sum being always 14.

The mathematical expectation for any one throw is therefore

$$\begin{aligned} &\frac{1}{36} \cdot 2 + \frac{2}{36} \cdot 3 + \frac{3}{36} \cdot 4 + \frac{4}{36} \cdot 5 + \frac{5}{36} \cdot 6 + \frac{6}{36} \cdot 7 \\ &+ \frac{5}{36} \cdot 8 + \frac{4}{36} \cdot 9 + \frac{3}{36} \cdot 10 + \frac{2}{36} \cdot 11 + \frac{1}{36} \cdot 12 \end{aligned}$$

In all—

$$\frac{1}{36}(2 + 6 + 12 + 20 + 30 + 42 + 40 + 36 + 30 + 22 + 12),$$

$$\text{or } \frac{1}{36} \cdot 252 = 7.$$

The meaning of this is, *not* that we shall probably throw seven the first time, nor second, nor perhaps for many throws; but that if we throw a number of times, add the results, and divide by the number of throws, the final result will be more and more nearly equal to seven, the greater be the whole number of throws. It is very instructive to make the experiment, say on 100 throws of two dice, as in backgammon. If the mathematical result be not closely verified by such a trial, the dice are loaded; or, at least, are ill-made.

Another illustration, and a very excellent one, is furnished by the following theorem.

If the floor be ruled with equidistant parallel lines, and a straight rod, whose length is equal to the distance between any two contiguous lines, be dropped upon it at random, the chance of its falling

on one of the lines is $\frac{2}{\pi}$, where π is the ratio of

the circumference of a circle to its diameter (see QUADRATURE OF THE CIRCLE). The deduction of this result from the theory of Probabilities requires the use of the integral calculus, and cannot be given here; but we may put the above theorem to the test of practice in the following way. Let the rod

be tossed a number of times, then the greater this number, the more nearly shall we have

$$\frac{\text{Twice number of throws}}{\text{Number of times the rod falls on a line}} = \pi$$

$$= 3.14159, \&c.;$$

and therefore, by simply continuing this process long enough, we may obtain as accurate a value as we choose of the ratio of the circumference to the diameter of a circle.

To shew how the theory of Probabilities would tend, if generally known, to the discouragement of gambling, would require a treatise—as every species of game would have to be treated—we shall therefore only take one case, about as bad a one as can be. This is when a man makes a 'book' on a horse-race, so as to 'stand to win,' whatever be the result of the race. This is, of course, immoral; for, as it can make no matter who accepts his bets, suppose them all taken by one individual. The latter must therefore have been 'done' into a complex transaction by which he is *certain to lose*. The method of making such a 'book' is simple enough; it consists mainly in betting *against* each horse. Thus, if three horses, A, B, C, are to start, and he can get the following bets taken—

£4 : £3 against A,
£5 : £4 " B,
£6 : £2 " C;

his book stands thus:

If A win, he wins £4 + £5 - £4 or £5.
" B " " £5 + £3 - £5 " £3.
" C " " £4 + £3 - £6 " £1.

Now, to examine this case, suppose the *correct* odds to have been laid against A and B, what ought in fairness to be the odds as regards C?

Chance of A winning is $\frac{3}{7}$
" B " " $\frac{4}{9}$

Chance of A or B winning = $\frac{3}{7} + \frac{4}{9} = \frac{55}{63}$

Hence, chance of C winning = $\frac{8}{63}$; and therefore the legitimate odds against C are 55 to 8, whereas our betting-man has got a *fool* to accept 6 to 5.

The true cause of the detestation which attaches to gambling, is not so much the ruin, insanity, suicide, &c., in which it not unfrequently ends, as the fact, that a gambler's work in no case increases the wealth or comfort of the state; all it can effect is a more or less rapid and dishonest transfer of these from one state of distribution to another. It is as useless, so far as regards production, as the prison-crank.

There is a common prejudice as to '*runs of luck*,' which are popularly supposed *not* to be compatible with the mathematical theory. This, also, is a complete delusion. To take a very simple case, the reader will easily see that, if he writes down all the possible cases which may occur in six tosses of a coin, the odds are 19:13 in favour of a run of three at least.

To give an instance of the principle of interpretation which we have several times above applied to the mathematical result—viz., that the greater the number of trials, the more nearly will the average result of these trials coincide with it—let us recur to heads and tails. Suppose a coin tossed ten times, and let H^n stand for H^n times, then we have

$$1 = \left(\frac{1}{2} + \frac{1}{2}\right)^{10}$$

$$= \frac{1}{2^{10}} \left(1 + 10 + \frac{10 \cdot 9}{1 \cdot 2} + \frac{10 \cdot 9 \cdot 8}{1 \cdot 2 \cdot 3} + \&c.\right)$$

of which the terms are [as in (D)] the probabilities of H^{10} , H^9T , H^8T^2 , &c. respectively; the order not being taken account of. The largest term is the 6th, and its value is $\frac{252}{2^{10}} = \frac{252}{1024}$, or about $\frac{1}{4}$. This is the chance of H^5T^5 , without regard to order, in ten throws. Although the most probable result, inasmuch as the chances of H^9T and H^1T^9 are each about $\frac{1}{5}$ only, and those of the other possible combinations much smaller—yet it has not a very large chance. But the chance of a result *not deviating much from the most probable one*, is very much larger: in the above case, the chance of having not less than 3H, and not less than 3T, is as much as $\frac{912}{1024}$.

But this tendency of the bulk of the results to coincide very closely with the most probable one, is much more evident as we take a greater and greater number of trials. Thus, in 100 trials with the coin, we have—

$$1 = \left(\frac{1}{2} + \frac{1}{2}\right)^{100}$$

$$= \frac{1}{2^{100}} \left(1 + 100 + \dots + \frac{100 \cdot 99 \cdot 98 \dots 51}{1 \cdot 2 \cdot 3 \dots 50} + \&c.\right)$$

[Now we begin to see how the higher analysis comes in. Who is to work out by common arithmetic the value of the fraction $\frac{100 \cdot 99 \cdot 98 \dots 51}{1 \cdot 2 \cdot 3 \dots 50}$?

Some calculating boy *might*, with no very enormous labour—but, wait a moment, we may wish to have the result of a million of trials, and what calculator (arithmetical) will tell us the value of

$$\frac{1,000,000 \times 999,999 \times \dots \times 500,001}{1 \times 2 \times \dots \times 500,000} ?$$

In this case, the most probable result is $H^{50}T^{50}$, without regard to order, but its chance is only about $\frac{2}{25}$.

[The exact value is $\frac{1}{2^{100}} \cdot \frac{100 \cdot 99 \cdot 98 \dots 51}{1 \cdot 2 \cdot 3 \dots 50}$.

Had there been 1000 throws, the chance of $H^{500}T^{500}$ (the most likely combination) would have been about $\frac{1}{38}$. But, as the number of throws increases,

the number of terms grouped close to the largest in the expansion, and whose sum far exceeds that of all the rest, becomes a smaller and smaller fraction of the entire number of terms. Hence the chance that in 1000 tosses there should not be more than 600 nor less than 400 H, is much greater than that of not more than 60 nor less than 40 H in 100 throws; and so on.

Thus it is that all our statistical results, say the ratios of the numbers of births, marriages, suicides, &c. to the whole population—or that of the male to the female births—or that of the dead letters to the whole number posted, &c.—though perhaps never the same in any two years, yet fluctuate between very narrow limits. And thus it is that the theory of Probabilities has been the means of solidly establishing, beyond almost the possibility of failure, when properly applied, the inestimable securities afforded by life-assurance.

Another very important application of the theory is to the deduction of the *most probable* value from a number of observations (astronomical, meteorological,

ke.), each of which is liable to error. We may confidently assert that, but for this, astronomy could not have taken the gigantic strides by which it has advanced during the present century. But the 'Method of Least Squares,' as it is called, which is furnished for this purpose by the theory of probabilities, is far beyond the scope of elementary mathematics, and can therefore only be referred to here. Its fundamental features may be seen in the above process of determining the probability that the result of a number of trials shall lie within certain limits on each side of the most probable result.

The theory of Probabilities has been applied to many other important questions, of which we may mention only two—the value of evidence, and the probability of the correctness of the verdict given by various majorities in a jury. But for these, and for the further development of what we have given above from the simplest points of view, we must refer to the various treatises on the subject. Of these, the most accessible to an English reader are the very valuable works of Galloway and De Morgan. Poisson, Gauss, and especially Laplace, have also treated the subject in the most profound manner. But the difficulty of understanding Laplace's great work is such, that few have ever mastered it completely; and it is therefore particularly satisfactory that the late Professor Boole, in his *Laws of Thought*, has shewn how to dispense with a great part of the analysis which renders Laplace's work so formidable.

PROBATE COURT is a court created in England in 1858, in lieu of the old Prerogative Courts, to exercise the exclusive jurisdiction in all matters touching the succession to personal estate. The rules on which its jurisdiction is founded are, that whenever a man dies he must either leave a will or not. If he leave a will, then it must be produced and verified, so as to demonstrate to all parties interested that it is an authentic will, and has been duly executed and signed in presence of witnesses, and therefore that the right to the personal estate is vested in the executors named by the will. The will is sworn to by the witnesses, on being produced; and if the evidence is satisfactory, it is registered, and the original deposited in the court, when copies are made. This process is called proving the will, and the act of court is called the probate of the will. If there is no will, then the rule being, that the personal estate devolves on the next of kin and widow, if any, it is necessary that an application be made to the court to appoint one of the next of kin to be the administrator, and take charge of the payment of debts. This is called taking out administration, and the act of the court appointing the administrators is called letters of administration. Numerous difficulties often arise as to irregularities in the making of wills and as to the party entitled to administration, and it is the function of the Court of Probate to dispose of these.

PROBOSCIDEA, a section of *Ungulata*, of which the characters are given under *Pachyderms*, contains one recent and two fossil genera, *Elephas* (see **ELEPHANT**), *Mastodon* (q. v.) and *Dinotherium*; so that the P. seem not to have been numerous at any period of the world's history. Notwithstanding the great size of these creatures, comparative anatomists have pointed out various resemblances in their dentition, osteology, &c., to rodents.

PROBOSCIS MONKEY. See **NASALIS**.

PROBUS, MARCUS AURELIUS, Emperor of Rome, was born at Sirmium, in Pannonia. His father, Maximus, served first as a centurion, and afterwards as a tribune in the Roman army, and died in

Egypt, leaving to his only son a good name and a moderate income. P. early entered the army, and had the good fortune to attract the favourable notice of the Emperor Valerian, who elevated him before the legal period to the rank of tribune. His subsequent conduct justified his rapid promotion, for he greatly distinguished himself against the Sarmatians on the Danube, and subsequently in Africa, Egypt, Asia, Germany, and Gaul, winning golden opinions from Valerian's successors, Gallienus, Claudius II., Aurelian, and Tacitus. By the last-named emperor, he was appointed governor of the whole Asiatic possessions of Rome, and declared to be the chief mainstay of the Roman power; and such was the zealous attachment evinced for him by his soldiers, whose respect and love he had equally won by his firm discipline, by his care in providing for their wants and comforts, and his liberality in the distribution of plunder, that, on the death of Tacitus, they forced him to assume the purple; and his rival, Florianus, having been removed, P. was enthusiastically hailed emperor by all classes (276 A.D.). His brief reign was signalised by brilliant and important successes; the Germans, who, since Aurelian's time, had made Gaul almost a part of Germany, were driven out with enormous slaughter, pursued into the heart of their own country, compelled to restore their plunder, and to furnish a contingent to the Roman armies. Pursuing his victorious career, P. swept the inimical barbarians from the Rhetian, Pannonian, and Thracian frontiers, and forced Persia to agree to a humiliating peace. Various aspirants to the imperial purple were also put down. On his return to Rome, P. celebrated these fortunate achievements by a triumph, and then, the external security of the empire being established, devoted himself to the development of its internal resources. The senate was confirmed in its privileges; liberal encouragement was given to agriculture; numerous colonies of barbarians were established in thinly-peopled spots, that they might adopt a civilised mode of life; and all branches of industry were protected and promoted. But P. was at a loss what to do with his army, as the Romans had now no enemies either at home or abroad; and fearing that their discipline would be deteriorated by a life of inactivity, he employed the soldiers as labourers in executing various extensive and important works of public utility. Such occupations, considered as degrading by the soldiers, excited among them the utmost irritation and discontent; and a large body of troops, who were engaged in draining the swamps about Sirmium, giving way to these feelings, under the excitement produced by the presence of the emperor, murdered him, 282 A.D. P. possessed great military genius, combined with equal administrative talent, and added to these a wisdom, justice, and amiability equal to that of Trajan or the Antonines.

PROCAMELES, an extinct genus from the Miocene of North America, discovered by Hayden in Nebraska, near the recent camels. Three species are known; one as large as the camel.

PROCESSION OF THE HOLY GHOST, that doctrine regarding the Third Person of the Blessed Trinity which teaches that as the Son proceeds (or is born) from the Father, so the Holy Ghost proceeds (or emanates) from the Father and from the Son, but as from one principle. The question of the origin of the Holy Ghost was not distinctly raised in the early controversies, which fell chiefly upon the Second Person. In the Creed of Nicaea, no allusion whatever is made to the subject; and in the Creed of Constantinople, the Holy Ghost is said simply to 'proceed from the Father.' Nevertheless, this was

understood in the Latin Church to mean that, as the Son proceeds from the Father, the Holy Ghost proceeds from both Father and Son; and in the course of the 7th and 8th centuries, the words 'and from the Son,' for greater distinctness, came to be added to the creed in several churches—as the West. In the controversy with the Latins, Photius (q. v.) took exception to this addition, as unauthorised, and made the addition one of the grounds for his charge of heresy against them, which was resumed on the consummation of the schism under Michael Cerularius. In the union of the Greek and Latin churches at Florence (1437), an article of agreement on this head was adopted, and the words *Filioque* were sung twice over both in Latin and in Greek, in the solemn mass which celebrated the union. But this union had no root in the popular mind, and the dispute still continues as of old to divide the churches.

PROCESSIONAL (Lat. *processionale*), the service-book which contains the prayers, hymns, and general ceremonial of the different processions. Many ancient books of this class have been preserved. The processional approved for common use is that of Rome, of which many editions have been published.

PROCESSIONS, as solemn and religious rites, are of very great antiquity. With the Greeks and Romans, they took place chiefly on the festivals of Diana, Bacchus, Ceres, and other deities; also before the beginning of the games in the Circus; and in spring, when the fields were sprinkled with holy water to increase their fertility. The priests used to head them, carrying images of the gods and goddesses to be propitiated, and either started from certain temples or from the Capitol. Among the Jews, certain processions around the altar were (and still are to a certain extent) usual on the Feast of Tabernacles; and from them the Mohammedans have adopted their mode of encompassing the sanctuary seven times at Mecca (q. v.). Processions form a prominent part of the Buddhist worship. The practice was early adopted in the Christian Church. The Reformation abolished it; and even in the Roman Catholic Church, especially in mixed countries, processions are less frequent or popular now than in former years. They are there either supplicatory processions or cross processions, and are either directed to a certain distant place, to some miraculous image or object, or they are confined to the streets of the cities and the churches. Banners, crosses, and images are generally carried in front; the clergy follow; and the people make up the rear, singing hymns or reciting prayers. In some Protestant states, they are still permitted, under certain restrictions. There is no doubt that, whatever their general intrinsic value, they offer in many instances one of the most striking picturesque features of the Roman faith; and that they answer a certain instinctive want in the multitude. For extensive pilgrimages, as such, their history and rites, we refer to PILGRIM, MECCA, FESTIVALS, &c.

PROCHEIN AMI, the old Norman-French for next friend; still often used in English law, means the person in whose name an infant sues in a court of law, or a married woman in a court of equity. The chief object is to have a person responsible for costs. See NEXT FRIEND.

PRO'CIDA, an islet of Italy, between the island of Ischia and the shores of Naples, and separated from both of these by sea-ways about a mile in width, is three miles long and one mile broad. Pop. 13,810. On its shores is the city of the same name, with a commodious harbour, a fine regal palace, and

a horrible state-prison, recently rendered famous by Carlo Poerio, who was confined there in chains.

PROCLAMATION, a public notice given by the sovereign to his subjects. The power of issuing proclamations is part of the prerogative of royalty as the fountain of justice. They sometimes consist of an authoritative announcement of some matter of state, or act of the executive government affecting the duties and obligations of subjects. The demise of the crown, and accession of a new sovereign, a declaration of war, and the issue of new coin, are all occasions on which a royal proclamation is issued. A proclamation may also be issued to declare the intention of the crown to exercise some prerogative or enforce some law which has for a long time been dormant or suspended. In time of war, the crown by a proclamation may lay an embargo on shipping, and order the ports to be shut. But the most usual class of proclamations are admonitory notices for the prevention of offences, consisting of formal declarations of existing laws and penalties, and of the intention to enforce them; such as the proclamation against vice and immorality, appointed to be read at the opening of all courts of Quarter Sessions in England.

Proclamations are only binding when they do not contradict existing laws, or tend to establish new ones, but only enforce the execution of those which are already in being, in such manner as the sovereign judges necessary. A proclamation must be under the Great Seal. Statute 31 Henry VIII. c. 8 declared that the king's proclamations should be as binding as acts of parliament; an enactment which, while it subsisted, made an entire revolution in the government; but was repealed by 1 Edw. VI. c. 12. In later times, it was attempted to be maintained by the crown lawyers that the king might suspend or dispense with an existing law by proclamation; a power, however, which act 1 Will. and Mary c. 2 declared not to exist.

PRO'CLUS, called the SUCCESSOR (*Diadochos*)—i. e., of Syrianus, as the head of the Athenian school—a celebrated Neo-Platonist, was born in Constantinople in 412. He was of Lycian origin, and received his first instruction at Xanthus, in Lycia. He then studied at Alexandria under Arion, Leonaras, Hero, and especially under Heliodorus, with whom he applied himself chiefly to Aristotelian and Platonic philosophy. From thence he went to Athens, where a certain Plutarch, a philosopher, and his daughter, Asclepigieneia, became his instructors—the latter a priestess of Eleusis, chiefly in theurgic mysteries. The vivid imagination and enthusiastic temperament which in his childhood already had led him to believe in apparitions of Minerva and Apollo, naturally convinced him, when all the influences of the Mysteries (q. v.) were brought to bear upon him, still more of his immediate and direct intercommunication with the gods; and he distinctly believed himself to be one of the few chosen links of the Hermaic chain through which divine revelation reaches mankind. His soul had, he thought, once lived in Nicomachus the Pythagorean, and, like him, he had the power to command the elements to a certain extent, to produce rain, to temper the sun's heat, &c. The Orphic Poems (q. v.), the writings of Hermes, and all that strangely mystical literature with which the age abounded, were to him the only source of true philosophy, and he considered them all more or less in the light of divine revelations. That same cosmopolitan spirit in religious matters which pervaded Rome towards her end, had spread throughout all the civilised 'pagan' world of those

days, and P. distinctly laid it down as an axiom, that a true philosopher must also be a hierophant of the whole world. Acquainted with all the creeds and rites of the ancient Pantheons of the different nations, he not only philosophised upon them in an allegorising and symbolising spirit, as many of his contemporaries did, but practised all the ceremonies, however hard and painful. More especially was the practice of fasting in honour of Egyptian deities, while on the one hand, it fitted him more and more for his hallucinations and dreams of divine intercourse, on the other hand more than once endangered his life. Of an impulsive piety, and eager to win disciples from Christianity itself, he made himself obnoxious to the Christian authorities at Athens, who, in accordance with the spirit of religious intolerance and fanaticism which then began to animate the new and successful religion against which P. waged constant war, banished him from this city. Allowed to return, he acted with somewhat more prudence and circumspection, and only allowed his most approved disciples to take part in the nightly assemblies in which he propounded his doctrines. He died in 485, in his full vigour, and in the entire possession of all his mental powers, for which he was no less remarkable than for his personal beauty and strength.

Respecting his system, some modern philosophers have exalted it to an extent which his own works would hardly seem to warrant. Victor Cousin holds that he has concentrated in it all the philosophical rays which emanated from the heads of the greatest thinkers of Greece, such as Pythagoras, Plato, Aristotle, &c. P. recognises a certain kind of unity of the Creator, or rather of the divine mind, of which he took the human to be a fragment; and he speaks of the 'One' and 'The First.' The human soul he considered wrapped up in various more or less dense veils, according to the degree of perfection attained; and he further assumed a certain sort of solidarity between the souls of those who naturally, or by certain immutable circumstances, were linked together, such as children and parents, rulers and subjects; and he carried this doctrine so far as to assert, that the children must naturally participate in their parents' faults. Faith alone, he further held, was essential to the attainment of Theurgy, which, comprising mantic and supernatural inspiration, is preferable to all human wisdom; and in this he chiefly differs from Plotinus (q. v.), with whose system he agrees in most other respects. He further tries to recognise and to fathom the original mysterious One by combination of figures, strongly reminding us of Gnosticism and the later Kabbala. His way of developing the finite beings out of the infinite Unit is also peculiar. A whole series of triads, at the head of each of which again stands a unit, goes in various gradations through the creation, the lower powers emanating from the higher, which are the thinking and creative ideas, &c. See PLOTINUS, GNOSTICS.

Of his manifold works, there have survived several hymns, which, by the true poetical and religious spirit which pervades them, stand out most favourably among the generally inane Orphic hymns. Of his astronomical and mathematical writings, there have survived a short summary of the chief theories of Hipparchus, Aristarchus, Claudius Ptolemæus, and others, a work *On the Heavenly Spheres*, a Commentary on Euclid, and a work—only known in a Latin translation—*On the Effects of the Eclipses of the Sun and Moon*. His grammatical works consist of some commentaries on Homer, Hesiod, &c. The greater part of his writings is devoted to philosophy. These are partly commentaries and paraphrases of Platonic dialogues, and partly the embodiments

of his own ideas in a systematic form. We thus have a work—again preserved in Latin only—*On Providence and Fate, On the Ten Doubts about Providence, &c., On Platonic Theology*, and other minor works, extant in a more or less fragmentary form, and repeatedly edited, with translations and modern commentaries. The most important of his works, however, is the *Philosophical and Theological Institution*, in which P. geometrically, as it were, evolves his doctrines by heading each of its 211 chapters by a kind of proposition, which he proceeds to demonstrate, appending corollaries in some instances. He chiefly treats in it of unity and multiplicity, on productive causes and effects, on the highest good, on that which suffices in itself, on immobility, perfection, eternity, divinity, and intelligence; on the soul, &c. Next in importance stand his commentaries on Plato's *Timæus*, which, however, now only embraces a third of this dialogue, a similar commentary on Plato's *Parmenides*, in seven books, on *Cratylus*, the *First Alcibiades*, and fragments on other Platonic writings. Some other works attributed to P. have by modern investigators been pronounced to be spurious.

PROCONSUL, a Roman magistrate not holding the consulship, who was invested with powers nearly approaching those of a consul, not, however, extending over the city and its vicinity. The proconsul was, at first, one who had held the office of consul, whose *imperium* was prolonged to enable him to bring an unfinished campaign to a close. The duration of the office was a year. During the latter period of the republic, when the consuls were expected to spend the year of their consulate at Rome, they were generally appointed at its close to undertake, as proconsuls, either the conduct of a war in some province, or its peaceful administration. Occasionally, the office of proconsul, with the government of a province, was conferred on a person who had never held the consulship. Under Constantine, parts of certain dioceses came to be governed by proconsuls.

PROCOP, ANDREW, the Hussite leader, known as P. the Elder, or the Holy, or the Shaven, in allusion to his having received the tonsure in early life, was born towards the close of the 14th c., and belonged to a noble family of Prague. After having travelled with an uncle for some years through France and Spain, he returned to Bohemia at the outbreak of the religious wars, in which Ziska (q. v.) took so prominent a part, and at once entered the ranks of the insurgent Hussites. His military genius soon raised him to the rank of an influential commander; and on the death of Ziska in 1424, P. was elected by the Taborites, who formed an important section of the Hussites, as their leader, and from this period till 1427, his history presents an almost unbroken series of daring attacks upon the Austrians. In the meantime, another body of Taborites, who called themselves Orphans, had overrun Lausitz, and burned Lauban, under the leadership of a man, subsequently known as Procop the Lesser, or Younger, who now, in concert with the more distinguished P., attacked Silesia, and took part in those internal feuds of the Hussite factions by which Bohemia was almost wholly ruined. The threatened approach of three German armies, which had been levied by the neighbouring states to carry on an exterminating crusade against the heretics, was alone able to restore unanimity to the divided Hussites, who, under the leadership of the two Procops, offered a desperate and successful resistance to the larger numbers of the Germans, subsequently pursuing their enemies with fire and sword through Silesia, Moravia, and

Hungary, as far as Presburg. In 1429, P. made inroads into the German states as far as Magdeburg, and returned to Bohemia laden with spoil, and followed by a numerous band of captive nobles and knights; and in the following year, at the head of 50,000 men-at-arms, and half as many horsemen, he again broke into Misnia, Franconia, and Bavaria, and after having burned 100 castles and towns, and destroyed 1400 villages and hamlets, and carried off a vast amount of treasure, turned his arms against Moravia and Silesia. The Emperor Sigismund at this crisis offered to treat with him, but the imperial demand, that the Hussites should submit to the decision of a council, afforded P. a pretext for breaking off all negotiations with the imperial court. A second German crusading army now advanced in 1431, but was thoroughly defeated at Riesenburg. These successes, which were followed by others of nearly equal importance in Silesia, Hungary, and Saxony, where the princes had to purchase peace at the hands of the two Procopos, on humiliating terms, induced the council of Basel to propose a meeting between the Hussite leaders and ten learned Catholic doctors. The meeting lasted fifty days, but was productive of no good result, and P. returned to Bohemia, where, combining his forces with those of Procop the Lesser, he laid siege to Pilsen. The council, on this, passed an act, known as the Basel Compact, by which the Hussites were allowed the use of the cup in the Lord's Supper, and the Bohemians were designated by the title of the 'First Sons of the Catholic Church.' The Taborites and Orphans, under the leadership of the two Procopos, refused, however, to have anything to do with the pope, and hence dissensions arose between them and the more moderate of the Hussites. After many lesser encounters between these factions, a decisive battle was fought near Lipau in 1434, in which P. was induced, by a feint of the enemy, to leave his intrenchments. His followers at first fought desperately against the troops of the Bohemian nobles, who were commanded by Meinhard of Neuhaus; but at length, under the influence of a sudden panic, they gave way, and took to flight. P., after vainly striving to re-form their broken lines, threw himself into the midst of the enemy, and was killed. Procop the Lesser, following in his steps, was also slain, and with these two brave Hussite leaders the cause of the Taborites perished.

PROCOPIUS, an eminent Byzantine historian, was born at Cæsarea, in Palestine, about the beginning of the 6th c., went to Constantinople when still a young man, and acquired there so high a reputation as a professor of rhetoric, that Belisarius, in 527, appointed him his private secretary. P. accompanied the great warrior in all his important campaigns in Asia, Africa, and Italy, and appears to have displayed remarkable practical as well as literary talent, for we find him placed at the head both of the commissariat department and of the Byzantine navy. He returned to Constantinople shortly before 542, was highly honoured by Justinian, and appointed prefect of the metropolis in 562. His death occurred, it is thought, about three years later. P.'s principal works are his *Historie*, in 8 books (two on the Persian war, from 408 to 553; two on the war with the Vandals, from 395 to 545; four on the Gothic war, going down to 553); *Ktēmata*, or six books on the buildings executed or restored by Justinian; and *Anekdotai*, or *Historia Arcana* (of doubtful genuineness), a sort of *chronique scandaleuse* of the court of Justinian, in which the emperor, his wife Theodora, Belisarius, his wife Antonina, and other distinguished persons, are depicted in the darkest colours. The most valuable

of these productions is undoubtedly the first, in which P. writes with the clearness, weight, and fulness of knowledge that might be expected of a man who had been an eye-witness of much of what he narrates, and who had occupied a position that fitted him to thoroughly understand what he had seen. He is the principal authority for the reign of Justinian. His style is pure, vigorous, and flexible. The best edition of his complete works is that by Dindorf (3 vols., Bonn, 1833—1838).

PROCRUSTES (Gr. 'the Stretcher'), the surname of a celebrated robber of Attica, named Damastes, or Polypemon. According to the ancient legend, he was wont to place all persons who fell into his hands upon a bed which was made either too long or too short for them, and where he racked their limbs till they died. This he continued to do until Theseus overpowered him, and made him suffer the tortures he had inflicted on others. The story has given rise to a figurative expression. When an author is subjected by a critic to a cruel or unfair mode of criticism, he is said to be stretched on 'the bed of Procrustes.'

PROCTER, BRYAN WALLER, an English poet, better known as BARRY CORNWALL, was born in 1787, and educated at Harrow. He studied law, was called to the bar in 1831, and for many years was one of the Commissioners of Lunacy, but resigned in 1860, and was succeeded by his friend Mr Forster, the historical essayist. His *Dramatic Scenes and other Poems* were published in 1819, and he subsequently produced several volumes both of verse and prose, the most important being *Mirandola, a Tragedy*. As a poet, P. belongs to the school of Keats and Hunt, and through all his works the influence of the old English dramatists may be traced like a vein through an agate. *Mirandola* was produced at Covent Garden Theatre, where it had considerable success. It is not, however, on his *Dramatic Scenes* or his tragedies, but on his songs, that P.'s reputation rests. In 1866 appeared his *Charles Lamb, a Memoir*. Procter died October 4, 1874.—His daughter ADELAIDE ANNE, the poetess, died in February 1864.

PROCTOR (formed by contraction from Lat. *procurator*, one who cares for another) is the name given to the practitioners in Courts of Admiralty, and in the Ecclesiastical and Prerogative Courts. It corresponds to attorney or solicitor in the other courts. By a recent statute, which abolished the exclusive jurisdiction of the Admiralty and Prerogative Courts, now the Probate Court, all proctors were put on the same footing as attorneys and solicitors, and the power to practise in the new courts indifferently was given to each; and at the same time compensation was given for the loss of their monopoly. The mode by which one becomes a proctor is therefore the same as that by which one becomes an Attorney or Solicitor (q. v.).

PROCTORS, officers in the universities of Oxford and Cambridge (two in number in each), whose duties are to preserve the peace of the university, to repress disorders among the students, and inflict summary academical punishment. They have the command of the academical constabulary force, and have also an extensive police jurisdiction in the town. The proctors must be Masters of Arts, and are chosen by the colleges according to a certain rotation. They nominate two pro-proctors to be their deputies and assistants. The summary authority of the proctors extends both to undergraduates and Bachelors of Arts. They have also a legislative authority as assistants to the heads of houses, and vote in the election of some of the professors and other officers.

PROCURATOR-FISCAL, a legal practitioner in Scotland of some consequence, owing to his being the public prosecutor for a local district. He is generally a local procurator, or law-agent, and is appointed by the sheriff of the county, or in cities and towns by the magistrates. His business is to take the initiative in the prosecution of crimes. There being no coroner's inquisition in Scotland, he does the work which that functionary does in England. Whenever he has reason to believe a crime has been committed, his duty is to apply for a warrant to arrest the alleged criminal, or to summon him before the sheriff, when the witnesses are cited, and are precognosed—that is, they give what evidence they are in possession of. All the inquests and examinations of the procurator-fiscal are conducted privately; neither the press nor the public being allowed to be present. This arrangement, as tending to huddle up that which should be fully known—as, for example, the cause of catastrophes attended with loss of life—has latterly been the subject of earnest remonstrance. If the procurator-fiscal is informed of a crime which he thinks was either not committed, or of which there is no evidence satisfactory, he gives his concurrence merely to the private party who suggests it, but does not himself initiate the proceeding. When the procurator-fiscal takes the precognitions of the witnesses, he sends a copy of them to the crown counsel, of whom the Lord Advocate is the chief; and if these counsel think the evidence is strong enough, and warrants more than suspicion, the prosecution is proceeded with to trial. The procurators-fiscal are now paid by salaries according to the population of the district.

PRODIGY. See **OMEN**.

PRODUCTION OF DOCUMENTS is often required in legal proceedings, or in the course of a suit, in Scotland, as well as in other countries; but it depends on the nature of the suit when and under what conditions the documents must be produced. As a general rule, whenever a right is founded on a document, that document must be produced or shewn to the court which has to determine the nature of the right.

PRODUCTIVE, and UNPRODUCTIVE, LABOUR. See **LABOUR**.

PROFESSOR, an officer in a university whose duty it is to instruct students, or read lectures on particular branches of learning. In the early times of universities, the degrees conferred on students were licenses to act as public teachers; and the terms Master, Doctor, and Professor were nearly identical in signification. As, however, the body of graduates ceased in the course of time to have any concern in public teaching, a separate class of recognised teachers sprang up, paid sometimes with salaries, in other instances by fees. These were called professors; and in the German and Scottish universities became the governing body, and sole recognised functionaries for the purpose of education. In the universities in which collegiate foundations prevailed, as Oxford and Cambridge, they became, on the other hand, only secondaries or auxiliaries, attendance on their lectures not being generally deemed indispensable, and the necessary business of instruction being carried on by the functionaries of the several colleges.

The word professor is occasionally used in a loose way to denote generally the teacher of any science or branch of learning, without any reference to a university. It has been assumed as a designation not only by instructors in music and dancing, but by conjurers.

PROFILE, the outline of a section through a cornice or other series of mouldings.—The outline of a capital when drawn geometrically; the outline of the human face in a section through the median line; &c.

PROGNOSIS (from the corresponding Greek word) is the term employed in medicine to indicate the opinion or decision of the physician regarding the probable course and issue of a disease. The physician is guided in arriving at his decision by his knowledge of the course which the disease usually follows; and as some diseases almost always end in recovery, and others almost invariably terminate fatally, the final result may often be predicted with great confidence. In forming a prognosis, the physician must, however, not only take into his consideration the natural history of the individual disease, but numerous modifying influences, such as age, sex, mode of life, previous state of health, &c.

PROGRESS OF TITLES, in Scotch Law, means the series or chain of conveyances by which a proprietor of lands establishes his right to property. As these titles are the sole evidences of property, the progress of titles—i. e., a short statement of the nature of each conveyance, in their historical order—is first given to a purchaser, to shew that the vendor is able to sell. See **SALE OF LAND**.

PROGRESSION, in Arithmetic, is the succession, according to some fixed law, of one number after another. A series of numbers so succeeding one another is said to be 'in progression.' Progression may be of various kinds, but the three forms of most frequent occurrence are *Arithmetical Progression* (q. v.), *Geometrical Progression* (q. v.), and *Harmonical Progression*. The conditions of the harmonical progression of a series are frequently stated as follow: *three numbers are in harmonical progression, when the first has to the third the same ratio that the excess of the first over the second has to the excess of the second over the third*, i. e., a, b, c are in harmonical progression when $a : c :: a - b : b - c$; but a much simpler conception of it is obtained by means of one of its properties, viz, that if the terms of a harmonical series be inverted, they form a series in arithmetical progression; thus, 1, 2, 3, 4, 5, 6, &c. is an arithmetical progression; and $1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \frac{1}{6}$, &c. is a harmonical progression; $1, \frac{1}{2}, 0, -\frac{1}{2}, -1$, &c. is an arithmetical progression; and $1, 2, \infty$ (infinity), $-2, -1$, &c. is a harmonical progression. This series is principally important in connection with the theory of music, in determining the length of the strings of instruments. See **MUSIC**.

PROGRESSION, MUSICAL, the regular succession of chords or movement of the parts of a musical composition in harmony, where the key continues unchanged, is called Progression; where a new key is introduced, it is not progression, but Modulation (q. v.). Musical compositions move from note to note either by degrees, when the interval does not exceed, or by skips where it does exceed a whole tone. Motion in music of two parts is of three kinds: oblique, when one part repeats or holds on the same note, while the other moves up or down; direct, when both parts move in the same direction; and contrary, when one moves up, and the other down. In progressing from chord to chord, it is in general desirable to retain every note common to both chords in the same part in which it appeared in the first chord, and to assign every new note to that part in the second chord which is nearest to it. There are certain chords which require to be followed by certain others in order to resolve them (see **RESOLUTION**); and there are certain progressions which must in ordinary cases be avoided, more particularly consecutive fifths and consecutive octaves,

the latter being, however, admissible when employed to strengthen a part.

PROHIBITION. Prohibitive duty refers to a practice, obsolete in this country, of prohibiting the importation of goods, with the view of encouraging native industry. See **FREE TRADE**.

PROHIBITION is a writ in England proceeding out of a superior court of law to prohibit or prevent an inferior court from proceeding to hear or dispose of a suit or matter over which it has no jurisdiction. —In Scotch law, the same word means a technical clause in a deed of entail by which the heir of entail is prohibited from selling the estate, or contracting debt, or altering the order of succession under pain of forfeiture, which forfeiture is declared by another supplemental clause called a resolute clause.

PROJECTILES, THEORY OF, is the investigation of the path or *trajectory*, as it is called, of a body which is projected into space in a direction inclined to that of gravitation. A body thus projected is acted upon by two forces, *the force of projection*, which, if acting alone, would carry the body onwards for ever in the same direction and at the same rate; and *the force of gravity*, which tends to draw the body downwards towards the earth. The force of projection acts only at the commencement of the body's motion; the force of gravity, on the contrary, continues to act effectively during the whole time of the body's motion, drawing it further and further from its original direction, and causing it to describe a curved path, which, if the body moved in a vacuum, would be accurately a parabola. This is readily seen by considering fig. 1, in which A represents the point from which the body is projected (suppose the embrasure of a fort); AB the direction of projection (horizontal in this instance); Al the distance which would be passed over by the projectile in unit of time if gravity did not act; 1—2, the distance which would

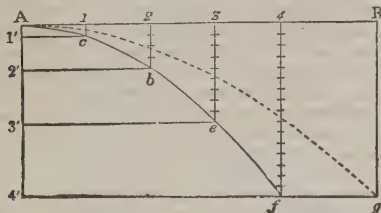

Fig. 1.

similarly be described in second unit of time; 2—3, 3—4, &c. the distances corresponding to the third, fourth, &c. units of time—all these distances being necessarily equal, from the impulsive nature of the force of projection; Al', again, represents the distance which the projectile would fall under the action of gravity alone in the first unit of time; 1'—2' the distance due to gravity in the second unit of time; 2'—3' the distance due to the third unit, &c., the distances Al', A2', A3', &c., being in the proportion of 1, 4, 9, &c. (see **FALLING BODIES**); hence, by the well-known principle of the *Composition of Forces and Velocities* (q. v.), we find at once, by completing the series of parallelograms, that at the end of the first unit of time the body is at c, at the end of the second at b, at the end of the third at e, &c. Now, as the lines 1'c, 2'b, 3'e, &c. increase as the numbers 1, 2, 3, &c., and the lines Al', A2', A3', &c. as the numbers 1², 2², 3², it follows that the curve Acbe is a Parabola (q. v.). As, by the second law of motion, each force produces its full effect undisturbed by the other, it follows that the projectile reaches f in

the same time as it would, without being projected, have taken to fall to 4'. A greater velocity of projection would make it take a wider flight; but at the end of four seconds, it must still be at some point in the same horizontal line—at g, for example.

In order to determine exactly the motion of a projectile, and to find its range, greatest altitude, and time of flight, it will be necessary to examine its nature more technically—for which some slight knowledge of algebra and trigonometry is requisite. Let the body in this instance be projected obliquely to the direction of gravity, from the point A (fig. 2) in the direction AT, and let the velocity of projection *v* be sufficient, if gravity were not to act, to carry it to T in *t* units of time, and let the force of gravity, if allowed to act upon it at rest, carry

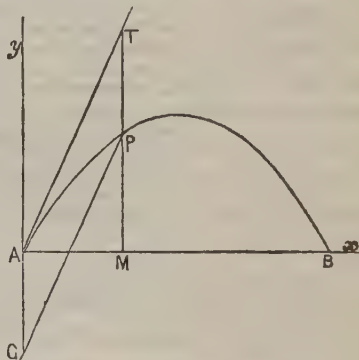

Fig. 2.

it to G in the same time; then, as before, the body, under the action of both forces, will be found at P (which is found by completing a parallelogram of which AT and AG are the sides) at the end of *t* units of time, having fallen through a distance equal to TP (not at once, but in a constant succession of minute deflections, as indicated in fig. 1) in that time. Let *t* represent the time of flight, *v* the velocity due to projection, *g* the accelerating force of gravity, and let A be the angle of elevation TAB; then AT = *vt*, TP = $\frac{1}{2}gt^2$, TM = *vt* sin. A; and consequently PM (or *y*) = *vt* sin. A — $\frac{1}{2}gt^2$ (I.), and AM (or *x*) = *vt* cos. A. Now, if we find from the last two equations the values of *t*, and equate these values, we obtain, by an easy algebraic process, the equation $y = x \tan. A - \frac{gx^2}{2v^2 \cos^2 A}$;

and if the height through which the body must fall to acquire a velocity equal to the velocity of projection be called *h*, then $v^2 = 2g \cdot h$, $h = \frac{v^2}{2g}$, $4h = \frac{2v^2}{g}$, and $\frac{1}{4h} = \frac{g}{2v^2}$, substituting which in the

equation, we obtain $y = x \tan. A - \frac{x^2}{4h \cos^2 A}$ (II.),

as the equation to the path of a projectile, where *x* is the horizontal distance, and *y* the corresponding height above the level of the point of projection. Suppose, now, that we wish to find the *time of flight* on the horizontal plane, it is evident that at the end of its flight the projectile will be at B, and *y* will be equal to zero; hence, putting *y* = 0 in

equation I., we obtain $t = \frac{2v \sin. A}{g}$. The *range* or distance AB is similarly found by putting *y* = 0 in equation II., when *x* is found to be equal to $4h \sin. A \cos. A$, or $2h \sin. 2A$. The *greatest altitude*

is evidently the point which the projectile has attained at the end of half the time of flight,

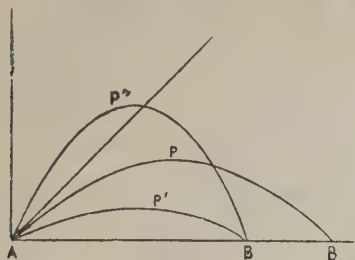

Fig. 3.

or after it has traversed half its horizontal range, hence, by putting $\alpha = 2h \sin. A \cos. A$ in equation II., or $t = \frac{v \sin. A}{g}$ in equation I., we obtain $y = h \sin.^2 A$. A slight examination of the expression for the range will shew that it is greatest when the body is projected upwards at an angle of 45° to the horizon, and that a body projected at a greater angle than 45° has the same range as one projected at an angle correspondingly less (fig. 3).

These results, however, do not correspond to the actual circumstances of the case, except when the projectile possesses considerable density and its motion is slow, for in all other cases, the resistance of the air, which increases in a rapid ratio with the velocity of the projectile, causes it to deviate very considerably from a parabolic orbit, especially during the latter half of its course (fig. 4).

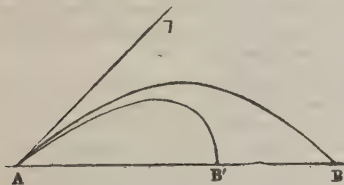

Fig. 4.

The problem of the motion of a projectile thus complicated becomes of considerable difficulty; partly because our knowledge of the law of resistance of the air is imperfect (it was supposed by Newton to be proportioned to the square of the velocity), and partly because the law varies with every minute change in the form, size, and density of the body projected, so that, under these circumstances, the beautiful and simple theory sketched above is practically useless. The chief illustrations of the theory of projectiles are the motion of missiles thrown by the hand, or arrows impelled from a bow, in both of which cases the resistance of the air is comparatively ineffective, the velocity being small: in the far more important case of ball-practice, whether with fire-arms or heavy ordnance, its effects are so powerful as to render the laws of gunnery mere deductions from experience. See RIFLE AND RIFLED ORDNANCE, and GUNNERY.

PROJECTION is the representation on any surface of objects or figures as they appear to the eye of an observer. It thus includes Perspective (q. v.), and is most simply illustrated by the shadow of an object thrown by a candle on a wall; the shadow being the projection, and the place of the light the position of the eye. The theory of

projections is of great importance, both in mathematics and geography, being, in the former case, perfectly general in its application; while in the latter only the projection of the sphere is required. Projections of the sphere are of various kinds, depending upon the position and distance of the eye from the sphere, and the form of the surface on which the projection is thrown; thus, we have the *orthographic*, *stereographic*, *globular*, *conical*, and *cylindrical* or *Mercator's* projections, all of which are treated of under the article MAP. Another projection frequently employed is the *gnomonic*. In the gnomonic projection, the eye is supposed to be situated at the centre of the sphere, and the surface on which the projection is thrown is a plane surface which touches the sphere at any one point (called the *principal point*). It is evident that a map constructed on the gnomonic projection is sensibly correct only for a circular area whose circumference is at a small angular distance from the principal point. From the position of the eye in the gnomonic projection, it follows that all great circles, or portions of great circles, of the sphere are represented by straight lines, for their planes pass through the eye. The distance of two points on the sphere, when measured along the surface, is least if they are measured along a great circle; and as the distance of the projections of these points on the plane is represented by a straight line, which is the shortest distance between two points on a plane, this projection, if employed in the construction of mariners' charts, would at once shew the shortest course. Maps of the earth's surface have been projected by the gnomonic method, the surface of projection being the interior surface of a cube circumscribing the sphere, and the complete series consequently amounting to six maps; but it is not fitted for the construction of maps of large portions of the earth's surface. The gnomonic projection derives its name from its connection with the mode of describing a gnomon or Dial (q. v.). The orthographic and stereographic projections were employed by the Greek astronomers for the construction of maps of the heavens; the former, or *analemma*, being the best known and most used. The stereographic, called *planisphere* by the Greeks, is said to have been invented by Hipparchus, and the gnomonic is described by Ptolemy. The others are of modern invention.

In Mathematics, the theory of projections is general in its application, and has been employed within the last few years to generalise the ancient geometry, and as a powerful aid to algebra. Its basis is the investigation and determination of those properties which, being true of a figure, are also true of its projections, such properties being necessarily dependent, not on the 'magnitude,' but on the 'position' of the lines and angles belonging to the figure. These properties are generally denominated *projective properties*. For instance, the three conic sections, the parabola, ellipse, and hyperbola, are merely various projections of a circle on a plane, and all 'positional' properties of the circle are at once, by this theory, connected with similar properties of the three conic sections. The theory is also largely employed in demonstrative mechanics.—See, for further information, *Mulcahy's Modern Geometry*, *Salmon's Conic Sections*, *Monge's Géométrie Descriptive*, *Poncelet's Propriétés des Figures Projectives*, and *Poisson's Traité de Mécanique*.

PROLAPSUS ANI is a common affection of the termination of the intestinal canal, and consists in an eversion of the lower portion of the rectum, and its protrusion through the anus. It may depend on a naturally relaxed condition of the parts, as in infancy, or may be caused by violent straining, in

cases of costiveness, piles, &c. Whenever it occurs, the parts should be washed, and, if possible, replaced by careful pressure with the hand; and if they do not easily return, the forefinger should be oiled, and pushed up into the anus, and it will convey the protruded intestine with it, after which the patient should retain the recumbent position for some hours. If it cannot be returned by the above means, surgical assistance should be at once sought. In order to remove the tendency to prolapsus, the patient should regulate his bowels so as to avoid costiveness, should sponge the parts after every evacuation with cold water or soap and water, and if necessary, use astringent injections, as, for example, a weak solution of sulphate of iron, one grain to the ounce. Dr Druitt (in his *Surgeon's Vade Mecum*) recommends a plan first suggested by Dr McCormac—namely, that when the stools are passed, the skin near the anus should be drawn to one side with the hand, so as to tighten the orifice. If, after the adoption of these means, the bowel continues to descend, certain surgical means must be resorted to, as destroying a small portion of the relaxed mucous membrane by the application of nitric acid, or pinching up a few folds of the protruded membrane with the forceps, and applying ligatures to them.

PROLAPSUS UTERI—known also as **PROCDENTIA** or **DESCENSUS UTERI**, by writers on the diseases of women; and as 'falling down of the womb,' or 'bearing down,' among non-professional persons—consists essentially in a depression of the womb below the natural level in the pelvis. It is a common affection amongst all ranks, and is most frequent in women beyond the middle age who have borne large families. It has, however, been met with in women who have not borne children, in virgins, and even (although very rarely) in children. It may occur in every degree, from the case in which the mouth of the womb is a little lower than its natural level, to that in which the womb itself projects externally, and forms a protruding tumour as large as a melon. In the latter case, it displaces by its traction the bladder, rectum, and other important structures. The prolapse is termed *imperfect* as long as there is no external protrusion, and *perfect* when the womb is protruded externally. The causes of these different degrees of prolapse are the same, and the symptoms differ only in intensity. The immediate causes are, according to Sir C. Clarke: (1.) Relaxation of the ligaments of the uterus; (2.) a want of due tone in the canal leading from the uterus to the external surface. The latter is probably the chief cause. After many child-bearings, it remains dilated, and its walls lose their resisting power. Similar effects result from repeated uterine hæmorrhage, leucorrhœa (popularly known as the *Whites*), and general debility. Under these conditions, a very slight downward force will depress the womb; and this force is supplied by the increased weight of the organ itself, if the patient sit up or walk soon after delivery, by violent vomiting or straining (when the bowels are constipated), by the endeavour to lift heavy weights, &c.

The symptoms arise partly from the pressure of the womb on other organs, partly from the simultaneous displacement of adjacent parts (as the bladder, rectum, &c.), and partly from reflex action (see **NERVOUS SYSTEM**). Patients with only a slight displacement usually complain of a sensation of fulness in the pelvis, of weight and bearing down, of dragging from the loins, often amounting to pain in the back, these symptoms being aggravated when the upright position is assumed. Strangury (q. v.) is occasionally present, and if the womb descend low or protrude, there is always more or less difficulty in evacuating the contents of the bladder and

rectum. The digestive organs soon become affected through reflected nervous influence. It is a remarkable fact, that the general health is often much worse in those cases in which there is a slight depression, than in those in which the prolapse is complete, and the womb forms an external tumour.

The treatment varies with the degree of displacement. In the milder cases, medicine should be administered with the view of giving tone to the mucous membrane of the relaxed canal; while in the severe cases, mechanical support is requisite. In comparatively mild cases, prolonged rest in the horizontal position should be enforced, and cold water (from half a pint to a pint) should be slowly injected, night and morning, into the canal leading to the uterus, by means of an elastic bottle, the patient being in the recumbent position as she receives the injection. If this treatment is insufficient, astringent injections, as decoction of oak-bark or of galls, or a solution of alum (an ounce to the pint of water), should be tried. If, however, there is any congestion or inflammation of the parts, astringents must be avoided. In a case of complete prolapse, the first duty of the practitioner is to attempt to restore the womb to its natural position. It is sometimes necessary to place the patient in a warm bath, or to apply fomentations or leeches to the tumour before it can be replaced; and occasionally, irreducible cases occur, in which it may be necessary to remove the organ altogether. But suppose it returned to its position, a repetition of the prolapse has to be prevented. The ordinary method is by the introduction of a pessary—an instrument of an oval or globular form, and usually made of box-wood, which mechanically supports the uterus in its normal position. See the works of Churchill, West, and others *On the Diseases of Women*. In some cases, a compress and bandage will afford sufficient support; while in other cases a surgical operation similar to that which is performed for *Prolapsus Ani* (q. v.) is expedient.

PROLÉTAIRES, a term used by the French (from whom it has been partially adopted by recent English and German writers) to denote the lowest and poorest classes of the community. It is derived from the Latin *proletarii*, the name given in the census of Servius Tullius to the lowest of the centuries, who were so called to indicate that they were valuable to the state only as rearers of offspring (*proles*).

PROMETHEUS (Forethought), the son of the Titan Iapetus and of Clymene, brother of Atlas, Menætiæ, and Epimætheus (Afterthought)—or, according to other legends, the son of Iapetus and Asia, or of Uranus and Clymene, or of Euryædon and Here—the father of Deucalion, Hellen, Lykus, and Chymærus. The myth of P. is one of the oldest of Greek antiquity, being mentioned by Hesiod, and is briefly as follows:—Once, under the reign of Zeus, men and gods were disputing with one another at Mecone; P., with a view to outwit Zeus, cut up a bull, and divided it into two parts, hiding the meat and the intestines in the skin, and putting a bad piece (the stomach) at the top of it; while he laid in another heap the bones, which were covered with fat. Zeus pointed out the unequal division, but was asked to choose, whereupon he guessed the deceit practised, and selected the good portion; but irate at the stratagem, he avenged himself on the mortals by withholding from them the fire necessary for the cooking of the meat; whereupon P. stole it in a hollow staff, and brought it to them. Zeus, to punish the mortals, caused Hephestus to mould a virgin of rapturous beauty, Pandora, whom Epimætheus was unwise

enough to receive as a present from Hermes; and thus brought, through her box, all imaginable ills that flesh is heir to upon humanity. P. himself was chained to a rock, and an eagle sent to consume his liver in daytime, while Zeus caused it to grow again at night. Herakles, however, killed the eagle, and, by the permission of Zeus, delivered the suffering Prometheus. Thus far Hesiod's legend. Æschylus, in his tragedy with the name of the hero, has perpetuated another view of the myth. P., according to him, is an immortal god, a friend of the human race, who does not shrink even from sacrificing himself for their salvation. He is the long-suffering hero, who, although overcome by Zeus's superior might, yet does not bend his mind. He at first assists Zeus against his own kindred, the Titans, and even opens his head at the birth of Minerva. But when Zeus, having come to the throne, conceived evil plans against mankind, wishing to destroy them entirely, in order to create a new race, P. throws himself into the breach; and while taking from them the evil gift of foreseeing the future, gives them the two infinitely superior gifts of hope and of fire. He is the inventor of architecture, astronomy, writing, figures, medicine, navigation, the mystery of prophecy, the arts of working in metal, and all other arts which embellish and adorn life. For these boons conferred on the human race, he is, by Zeus's order, chained to a rock in Scythia by Hephestus, who fulfils this task reluctantly. Here he is visited by the Oceanides, by Io, who tells him of her own miserable wanderings, and by Hermes, who endeavours to find out that which P. only knows, viz., who will be the son of Zeus and his successor. Refusing to divulge this secret, he is struck by Zeus's lightning, and hurled into Tartarus, whence he only re-issues after a time to undergo new sufferings. He is now fastened to Mount Caucasus, and the eagle, an offspring of Earth and Tartarus, comes to torment him daily. Cheiron, the Centaur, at last offers himself to supply P.'s place in Hades—for on no other condition was he to be liberated than that some other immortal should offer himself in his stead. Cheiron, incurably wounded by Herakles, is accepted by Zeus.—Other legends give varying accounts. One makes P. the creator of man out of earth and water—Zeus having, after the flood of Deucalion, ordered both him and Here to make man out of the mud left, and the winds to breathe life into them; and at Panopeus, in Phocis, a piece of that creative earth was in after times shewn to the wonder-struck multitude. It was also at his suggestion that Deucalion and Pyrrha built the vessel that bore them safely through the floods. P. had a sanctuary at Athens, and torch-races took place in his honour. Many have been the explanations of this myth, one of which is, that it represents the human mind, which, in the consciousness of its own power, refuses to obey implicitly the will of Zeus; another, that it embodies the first struggles between the ancient (Pelagian) powers of nature and the awaking of the mind, as represented by Zeus and the Olympians, &c. The subject is fully discussed in Welcker's *Æschyrische Trilogie Prometheus* (Darmstadt, 1824).

PROMISE, in English Law, is often used to denote one side of a contract or agreement, either by word of mouth or in writing which is not under seal. In England, an action cannot be brought on a promise unless some consideration was given for it; but in Scotland, a consideration is not necessary, provided the promise was made in earnest and with deliberation. A promise of marriage means a mutual promise, each being an equivalent

for the other; and accordingly, if one breaks the promise, the other can sue for breach of it. See MARRIAGE.

PROMISSORY-NOTE is a contract by which A, the promisor, agrees to pay B, the promisee, a sum of money, either on request or on a future day. A is called the maker of the note, and B the payee of the note. The law affecting notes is substantially the same in all respects, and is always treated as part of that of Bills of Exchange (q. v.).

PROMOTION, a term which has been applied to the granting of a degree by a university. The practice of conferring the title of doctor by authority and after examination, seems to have originated in the university of Bologna, in the middle of the 12th century. Degrees were at first conferred by *cooptation*, i. e., admission by the common consent of the body of doctors; but in the beginning of the 13th c., Honorius III. placed promotions under the control of the archdeacon of Bologna.

PROMOTION, in the ARMY AND NAVY. The efficiency of any body of men depends upon the energy of the individuals composing it: the root of that energy is emulation; and emulation can only be secured by maintaining a proper current of promotion. The efficiency of a service is thus dependent on the system of promotion adopted; and so important, consequently, does promotion become, that in the present article it is purposed to glance at the rules observed in the principal armies of the continent, before describing the system which obtains in the British service.

In the *Army of France*, it is a common saying, that every conscript has a marshal's *bâton* in his knapsack. Speaking of the times of the revolutionary war, this was doubtless true, for battalions chose their chief officers from their own ranks—a conscript of one year was often a lieutenant-colonel the next, and perhaps a brigadier-general the following. In the quieter times of recent years, however, progress is slower; and although promotion is open to all, and a considerable proportion of the officers do rise from the ranks, yet it is very rarely indeed that an officer, who has so risen, ever attains a higher grade than that of captain. Conscripts are enrolled for seven years; junior commissions are—if the rule of the service were strictly followed—given, one-third to men from the ranks, one-third to cadets from the military schools, and one-third by imperial patronage. In practice, it appears that in the Artillery and Engineers, two-thirds of the first commissions are given to pupils from the Polytechnique, and the remainder to men from the ranks; while in the Line, two-thirds of the officers rise from the ranks, and one-third come from the Military School of St Cyr. Before officers can be promoted, certain service in each rank is required, viz., as 2d lieutenant, two years; as lieutenant, two years; as captain, four years; as major, three years; and as lieutenant-colonel, two years. These periods are, however, curtailed in time of war. Promotion takes place in the regiment up to the rank of captain, two-thirds by seniority, and one-third by selection. From captain to major (*chef d'escadron ou de bataillon*), promotion is divided equally between seniority and selection; while to all higher ranks it falls exclusively to selection. The selection is made on reports by the inspectors-general of the several arms—their reports being founded on personal observation, and the testimony of senior regimental officers. To maintain rapidity of promotion there is a fixed age at which officers must retire, viz., lieutenant-general, 65; major-general, 62; colonel, 60; lieutenant-colonel, 58; major, 56; captain, 53; lieutenant, 52.

In *Austria*, all officers are at first cadets; but a large proportion of these cadets are nominated from men in the ranks by their comrades. The men themselves are conscripts, enrolled for eight years. Promotion goes by seniority, and in the regiment, with occasional selection from other regiments.

The organisation and officering of the *Prussian* army are both peculiar. Every Prussian subject, of whatever rank, is bound to serve from the age of 20 to 25; but in practice, this service is reduced to a year in the case of professional men. Every officer must serve in the ranks; but not necessarily for more than a day. Young gentlemen intended for officers enter the ranks as *aspiranten*. They do duty as common soldiers for from six to nine months, and pass two examinations. Afterwards they remain nine months at a Division School, or twelve months at an Artillery and Engineer School. They then become eligible for appointment as officers when vacancies occur, which, however, they cannot obtain unless recommended by the officers of their respective regiments. Two-thirds of the first commissions are given to these aspiranten, and one-third to pupils from the cadet schools.

In the *Italian* army, one-third of the sub-lieutenants are promoted from the ranks. Of subsequent promotion, two-thirds go by seniority, and one-third by selection.

It is always urged against the *British* system of army promotion that it is too exclusive, and confines the commissions to the upper classes of society; and there is no doubt that promotion from the ranks is much rarer than in almost any other army. But, on the other hand, it is argued, the constituents of the force are very different. Soldiers in Britain are not conscripts, who necessarily comprise men of all classes and all degrees of education, but are taken, as a rule, from an extremely low and very uneducated class of society. Again, Britain has a true middle class, which is wanting in almost every continental nation. Its army is not, therefore, necessarily aristocratic because it is not officered from the ranks. Lastly, the habits of the different classes of society differ so greatly, that unless the soldier be very superior to his comrades, promotion to a commission is a small boon.

With regard to the actual system of promotion which obtains: in the ranks, promotion from private up to company-sergeant takes place in the company, and is made by the regimental officers. The promotion of company-sergeants to be staff-sergeants is made throughout the regiment. All these promotions are by selection entirely. Of the commissioned officers, the quarter-masters and riding-masters are appointed almost exclusively from the ranks; but they have no further promotion to look forward to—sergeants and sergeants-major are occasionally gazetted to ensigncies or lieutenantcies. The junior combatant officers acquire their commissions either by a competitive examination, open to the whole nation, or by previous service in the militia as officers, or in the ranks of the army as non-commissioned officers. The Artillery and Engineers are officered entirely by cadets from the Royal Military Academy, whose subsequent promotion is by seniority only. In the Cavalry, Guards, and Line, vacancies are, since the abolition of the purchase system in 1871 (see PURCHASE SYSTEM), filled by 'seniority tempered by selection,' the selection becoming more strict as the higher ranks are reached. The promotion of officers, up to the rank of captain, is mainly regimental, and is at the same time by seniority; but seniority is in this case qualified by what has been called negative selection—that is, in other words, the exclusion of those officers who have not proved their fitness for

promotion at the periodical inspections and examinations previously held.

Above the rank of captain, for *substantive* or *regimental* rank, seniority is little regarded, and selection is more absolute; but officers may hold at the same time *army* or *brevet* rank, conferred for distinguished service, or for mere seniority in the general list of the whole army. This brevet rank does not affect the position in a regiment, and adds but a small sum to the officers' pay; but it is of great importance, inasmuch as colonels rise by seniority alone to be general officers, and colonel is almost exclusively a brevet rank (the only exceptions being in the Artillery and Engineers, where colonel is a regimental rank). Under these rules, it sometimes happens that an officer who has never held higher regimental rank than captain, may become successively, for good service, brevet-major, brevet-lieutenant-colonel, and brevet-colonel, until he succeeds, in his turn, to the rank of major-general. See also STAFF.

In the Navy, the promotion of sailors to be petty officers is made by the captain of the ship; petty officers are appointed to be warrant-officers by the admiral of the station, subject to Admiralty confirmation. The commissioned officers are appointed and promoted by patronage solely. When a ship is first commissioned, the captain is allowed to nominate one cadet, the Admiralty name the rest. Promotions are made by selection by the Admiralty, except death vacancies which occur abroad; these are filled up by the admiral commanding on the station from the officers of his fleet. Above the rank of captain, all promotions take place by absolute seniority. There is no purchase of commissions in the navy.

PRONA'OS, the area or space before the cell of a temple, through which it was entered.

PRONG-HORN, or PRONG-HORNED ANTELOPE (*Antilocapra Americana*), the *Cubree* of the Canadian voyageurs, a species near the Antelopes, type of a peculiar family, inhabiting the great western prairies of North America. Though apparently

Prong-horned Antelope (*Antilocapra furcifera*).

a hollow-horned ruminant, it really sheds its horns sheath, and the core secretes a new covering every year. It is common between the Saskatchewan and the Missouri, and also on the Columbia, and is found in plains and on low hills, where there is no wood or only scattered clumps of trees; never in mountainous districts, nor in forests. Its size is nearly that of

the roe; in its general form and gait it resembles the chamois. In summer, the hair of the P. is smooth and flexible, but as winter approaches it lengthens; each hair becomes thick, its interior becomes white and spongy, and it loses its flexibility, at last becoming brittle, so that its point is easily rubbed off; but this singular fur forms a very close and warm covering for the animal. The P. is generally seen in small herds, sometimes solitary. It is very curious about any strange object, and advantage is sometimes taken of this by Indian hunters, who crouch, run a few yards, and stop again; the prong-horns wheeling around them, coming nearer, and becoming still more curious, till they are within shot.

PRONOUNS. One of the classes of words or parts of speech, possessing a special interest both logical and philological. 'I am sick.' 'Thou knowest the truth.' 'John was here, but he went away again.' 'Peter struck the boy, who had done him no harm.' 'What do you want?' The words in italics in these sentences are called *Pronouns*, because they stand for (Lat. *pro*) nouns, or names of persons and things; and they are generally said to be used to prevent the too frequent repetition of the nouns. Yet the pronoun and the noun are not exact equivalents for each other. No noun can be an exact substitute for *I*, *thou*, or *who*. Pronouns are symbols, names, or highly-generalised marks, applied to objects to signify, not any inherent attribute, but merely their relations to the act of speaking. They might therefore be called *relational names*. *I*, for instance, is a name applicable to all subjects that can be conceived as speaking. In such a sentence as 'I am sick,' in which the state, 'sick,' is affirmed about some one, the exact force of *I* may be thus expressed: The person of whom 'sick' is affirmed is one with the person making the affirmation. Who the individual person is, the pronoun *I* gives no indication; it is implied that this is known from some other source. Those present learn it by hearing whence the sound comes; in a book, it is gathered from the context.

In like manner, *thou* is a generalised name for all persons spoken to. What it means or *connotes* is—with reference to the example above given—that the person affirmed to know the truth, and the person to whom the affirmation is addressed, are one and the same. What particular person it denotes must be learned, as before, from circumstances. If the clause, 'he went away again,' stood by itself, what person is denoted by *he* would be still more vague than in the case of *I* and *thou*. *He* merely implies that a person, neither the speaker nor the spoken to, but one known in some way, is the subject of the assertion. Who it is, is determined, in the example, by *John*, with which *he* stands in close relation. *Who* designates some person already named, referring us back to that name (the *antecedent*) for determining the individual. *What* connotes that the subject is unknown.

Pronouns are usually divided into Personal and Relative.

1. Personal Pronouns.—The several objects concerned in a speech or sentence stand in one or other of the three relations of speaker (First Person), object spoken to (Second Person), object spoken about (Third Person). Pronouns expressive of these relations are called Personal Pronouns. They are (in the nominative case), 1st person, *I*, *we*; 2d, *thou*, *ye* or *you*; 3d, *he*, *she*, *it*, *they*.

Along with the personal pronouns, and most nearly related to the pronouns of the third person, may be classed the words *one* and *that* in certain constructions. In phrases like, 'One cannot be sure of that,' *one* is an indefinite pronoun, designating

any person whatever. It is distinct from the numeral adjective *one*, being derived from the French *on*, which is a corruption of *homme*, man. When we say, 'I like peaches, but let me have a ripe *one*, or ripe *ones*,' we have now the numeral used as another indefinite pronoun. The first of these indefinite pronouns is applied only to persons; the second, both to persons and things.

When we say, 'Give me *this*, and keep *that*,' *this* and *that* may be considered as demonstrative adjectives, with some noun understood—this (thing). But in the expression, 'He mistook his own room for *that* of the stranger,' *that* appears to be as much a pronoun as *one*.

2. Relative Pronouns (including *Interrogative*).—Relative Pronouns, besides standing for nouns, have the power of conjunctions. They join sentences and clauses, by relating or referring back directly to something just named. The relatives in English are three—*who*, *which*, and *that*. See **RELATIVE PRONOUNS**.

What is used for *that which*, thus embracing both relative and antecedent. In phrases like 'such a storm as now burst on them,' *as* is used with the force of a relative pronoun. Perhaps the full expression would be 'such a storm as (the storm that) burst.'

3. Interrogative Pronouns are those used in asking questions; they are *who*, *which*, and *what*.

These are the *simple* pronouns. But a variety of compounds are formed by joining these simple pronouns with other words, such as *himself*, *whatever*, *any one*.

Pronouns, as we have seen, express the most abstract relations in language. They are, in fact, the most attenuated and colourless signs of thought conceivable—the highest effort, apparently, of man's generalising powers. Accordingly, in the days of purely *à priori* speculation on the origin and growth of language, it was held to be indisputable that pronouns must have been the latest product of the language-making faculty; and they have been appealed to as a conclusive argument against the theory that the meaning of all words, when they are traced to their origin, is grounded on sensible properties and relations of material things. The philologist, on the contrary, pursuing his investigations on the historico-comparative method, sees irresistible proof that pronouns, in the Aryan family of languages at least, were among the earliest words in use. In fact, besides their independent use, the same elements are found as suffixes forming the inflections (see **INFLECTION**) of the predicative roots, and first making them real words capable of entering into a sentence. In the beginning, however, they were far from being the impalpable abstractions they afterwards became, and really form the strongest proof of the theory they were supposed to upset. They were, in fact, simply demonstrative particles, indicating palpable relations of space or position ('that' or 'there,' 'this' or 'here,' 'what' or 'where?'). We can easily see how the indication of the vocal sign would at first be helped out and made precise by gesticulation; or more probable still, the gesticulation was at first the fundamental sign, and the word a natural involuntary utterance accompanying it, and in process of time taking its place.

Of the various demonstrative radicals still traceable in the Aryan tongues as pronouns and suffixes, one of the most universal and outstanding is the sound *ta* or *sa* for 'that' or 'this,' 'there,' 'it' seen in the Sanscrit *sa* (mas.), *sā* (fem.), *tad* (neut.); Lat. (*is*)*te*, (*is*)*ta*, (*is*)*tud*; Gr. *ho*, *he*, *to*; Goth. *sa*, *sō*, *thata*; A.-S. *se*, *sēo*, *thæt*; as also in the numerous allied adverbs, e. g., Lat.

tam, tunc; Ger. *dann*; Eng. *so, as, then, thus*. Another demonstrative radical, *ma*, seems to have been used to call attention to the speaker—to point to the immediate or central 'here'; in short, to the 'me.' Besides occurring in the oblique cases of the first personal pronoun, the element *ma* or *m* enters largely into the suffixes of the first person of verbs in the older languages, such as Greek and Latin. The only remnant of it in English is in *I am*. The nominative case of the first person pronoun in Sansc. is *ahám*, which is conjectured to be a mutilation of a fuller form, *ma-gha-m*; in Gr. and Lat. *ego*, Goth. *ik*, Ger. *ich*, A.-S. Eng. *I*, Ital. *io*, Fr. *je*, the *m* has completely disappeared. In the oblique cases it has been better preserved. The root of the 2d pers. pron. seems to have been the syllable *tu* or *tua*, indicating a position intermediate between the central 'here' and the more distant and contrasted 'there.' The form of this pronoun is more constant throughout the allied languages than that of any other: Sansc. *tvám*, Lat. *tu*, Gr. *ty* or *sy*, Ger. *du*, Eng. *thou*, Fr. *tu*, Ital. *tu*.

The pronouns of the first and second person are invariable in respect of gender, and are never used as adjectives; the pronouns of the third person not only take the form of adjectives in respect of gender, but are often—especially in the older languages—joined to nouns, in which case they are rather demonstrative (or relative) adjectives than pronouns; as Lat. *ille homo*, Eng. *that book*. It is difficult to trace any etymological relations between the singular and the plural in the first and second pronouns—e. g., between Lat. *tu* and *vos*, or Eng. *thou* and *you*; but this is not to be wondered at when we reflect that 'we' is not equal to 'I' and 'I', but to 'I' and 'he', or 'I' and 'thou'; and that 'you' is as much 'thou' and 'he' as 'thou' and 'thou.' The plurals must therefore have been compounded of several elements, which, by coalescence and abrasion, have become irrecongnisable.

The declension of the English personal pronouns is to be found in any elementary grammar. That of the third person is made up of fragments of several Anglo-Saxon words. The Anglo-Saxon pronoun was thus declined:

Sing. Nom.	<i>he</i> (he), <i>heó</i> (she), <i>hit</i> (it)
Gen.	<i>his</i> <i>hire</i> <i>his</i>
Acc.	<i>hine</i> <i>hi</i> <i>hit</i>
Dat.	<i>him</i> <i>hire</i> <i>him</i>
Plur. Nom. Acc.	<i>hi</i>
Gen.	<i>hira</i> (heora)
Dat.	<i>him</i> (heom)

The cases marked in italics are still used in modern English, only that *him* and *her* do duty in the accusative as well as dative. *His*, as the genitive of the neuter, has been supplanted in recent times by the secondary genitive *its*, a word which does not occur once in the English version of the Bible. *She* does not represent the Anglo-Saxon *heó*, but *seó*, the feminine of the article. The modern plurals *they*, *their*, *them*, have no direct etymological connection with the singular *he* (she, it); they are taken from the demonstrative or article *that* (that, the), which has, in the plural, nominative and accusative *thá*, genitive *thára*, dative *tham*. *Them*, like *him*, was thus originally a dative case. Is it a lingering memory of the demonstrative origin of *them* that keeps alive the vulgar error of 'them things'?

Such being the arbitrary, or rather chance way in which the English pronominal system has been built up out of the wrecks of the Anglo-Saxon, there is no good reason why *them*, *him*, *her*, should not have been used in the nominative as well as in

the accusative; and, in fact, in certain connections, these forms, together with *me*, are habitually so used, although grammarians have hitherto refused to sanction the usage. Such expressions as, 'It is me;' 'better than him, than them,' &c., are not confined to the uneducated; in familiar conversation, the most cultivated 'use them habitually, and in preference to what are considered to be the correct forms, which are felt somehow to be stiff and pedantic. This usage has the analogy of the French in its favour (e. g., *c'est moi*), and some English philologists have begun to defend it on principle. See Alford, *The Queen's English*.

From politeness and other rhetorical motives, various substitutes take the place of the usual personal pronouns. The English language departs little from the normal usage, except in *you* for *thou*, and in the regal and editorial *we*. A French shopkeeper, instead of 'What do you wish to see?' says: 'What does the gentleman (or lady) wish to see?' All modern languages use such substitutions as, 'Your Majesty, your Excellency, wishes;' but the Italian, in speaking further of the *Excellenza*, says: 'It (*ella*, she) wishes.' The Germans use regularly *they* (*sie*) for *you*, and one never hears *you* except from the pulpit. In Hebrew, politeness took the form of saying: 'Thy servant said,' for 'I said.' Similarly, the Chinese use: 'little man, subject, thief, blockhead,' for 'I;' and a Canadian backwoodsman speaks of himself as 'this 'oss,' or 'this here child.'

PROOF. See EVIDENCE.

PROOF OF FIRE-ARMS. Guns of all descriptions are proved before being issued for service. Muskets are tested by being fired with heavier bullets and larger charges of powder than they will in the ordinary way be required to carry. Cannon are subjected to a series of tests. First, they are gauged to ascertain that the dimensions are correct, the utmost variation permitted being .3 inch externally, and .033 in the diameter of the bore; but the position of the bore may deviate .25 inch from the line of the piece's axis. The next trial is by firing twice with heavy charges—the bore being subsequently minutely examined, to detect flaws or crevices in the metal. A cavity exceeding in depth .2 inch, if behind the first reinforce ring, or .25 if before that ring, condemns the piece. After the proof by firing, water is forced at a great pressure into the bore, in order that it may permeate any honeycombs or flaws: the next day, the bore is examined by means of a mirror, which casts a strong light into it. Flaws are then easily detected; for while the rest of the bore is thoroughly dry, water will continue for some time to weep or run from the holes, and will stand over them in drops. This operation completes the proof. When a gun bursts in proof, the remainder of the guns of the same sort then in proof are subjected to another round.

In the case of guns of hitherto untried form, some are tested to bursting, as specimens of the power and endurance of the whole number. For Proof of Powder, see *EPROUVETTE*.

PROPAGANDA (Lat. *De Propaganda Fide*, Regarding the Propagation of the Faith), the name of a Congregation, and also of a College, in Rome, the object of which is to direct and forward the propagation of the Catholic religion, especially among the heathen; although Christian dissenters from the Roman Church are not absolutely excluded from its operations. Pope Gregory XIII. (1572–1584) gave to some of the cardinals a special charge over the oriental missions, and caused catechisms and other religious books to be printed for the use of oriental Christians. The work which Gregory

XIII. originated, was fully organised by Gregory XV., who, by a bull of June 22, 1622, established a Congregation of cardinals for this purpose, which his successor, Urban VIII., extended and endowed, and to which he annexed a college for the education of missionaries to the several countries; one great feature of which has been to provide for such work natives of the several countries, who are conveyed to Rome at an early age for the purpose of being specially educated in all the necessary learning of a missionary. The Congregation consists of a number of cardinals appointed for life, one of whom is prefect, and who are assisted by a secretary, and by a number of consulters, clerks (*minutanti*), and other officials. Originally, their meetings were held weekly, and in the presence of the pope; now they are monthly, there being, however, weekly conferences (*congressi*) of the prefect, secretary, and consulters; and all important business is submitted to the pope in person by the prefect or the secretary. This Congregation conducts the affairs not only of the missionary countries, properly so called, but also of those—as England, the northern kingdoms, &c.—in which the hierarchical organisation is not, or has not been full and formal. The College of the P. is a noble institution, containing nearly 200 pupils of all countries, tongues, and complexions, who are not only maintained and educated gratuitously from a very early age, but are equipped and sent forward to their several destinations at the charge of the institution. The P. College contains a most valuable library, and museum of curious objects of missionary interest; and a polyglot printing-press of great extent and variety of resources in the printing art. Its great festival is the Epiphany of our Lord, or of His ‘manifestation to the Gentiles;’ and this feast is celebrated by an exhibition of exceeding interest and curiosity, in which are delivered recitations in every language represented in the College or its missions, amounting often to 50 or 60. Of this festival, the celebrated Cardinal Mezzofanti (q. v.) used to be the guiding spirit, as well as to strangers its chief centre of attraction. It continues to be one of the chief literary sights of the Roman winter.

PROPAGATION OF THE FAITH, ASSOCIATIONS FOR ROMAN CATHOLIC. The earliest and the highest in dignity of these has been already described under the head PROPAGANDA (q. v.). But the present century has produced several private associations, the resources of which arise entirely from voluntary annual contributions, and the organisation of which is most complete and most extensive. The first of these is that founded at Lyon in 1822, under the title ‘Œuvre de la Propagation de la Foi,’ with a branch at Paris, and subordinate branches in the other Catholic kingdoms. It is under the direction of a council, which communicates as well with the local associations through which the funds are supplied by small weekly, monthly, or yearly contributions, as with the missions to the aid of which the fund so raised is applied, by an apportionment regulated according to the necessities of each. The piety of contributors is stimulated by the exhortations of the popes, and the granting of indulgences to those who, with the other requisite dispositions shall aid in the work. The journal of the society, entitled *Annales de la Propagation de la Foi*, is a very interesting bi-monthly collection of letters and reports from the different missions connected with the central body. The receipts of this association for the year 1863 were 4,788,496 fr. 86 c. Of this sum, by far the largest proportion was raised in France—3,307,248 fr. Italy came next, though at a long interval,

contributing 420,653; Belgium gave 271,597; Germany, 251,873; the British Islands, 127,000. Spain, once the great propagator of the Gospel in the New World, contributed but 12,549; but it is to be observed that Spain maintains for her own missionary enterprises a large and liberal establishment in connection with the mission of the Philippines and the South Sea.

Another association of somewhat later date is the ‘Leopoldiner-Verein,’ established at Vienna in 1829, the chief object of which is to assist the missions of German origin, especially in America. This association also has its own journal, entitled *Berichte der Leopoldinen Stiftung*. It is under the presidency of the Archbishop of Vienna. A third is that established in Bavaria as an offshoot of the Lyon association, under the name ‘Ludwigs Missions-Verein.’ Like that of Vienna, its chief, although not exclusive object, is the support of German missions. The Ludwigs-Verein is conducted under the auspices of the Archbishop of Munich. All these associations, although quite independent in their management and direction, nevertheless maintain close relations with the Propaganda of Rome, and are often guided by the recommendations of the Cardinal Prefect in the distribution of their funds to particular missions.

PROPER, in Heraldry. A charge borne of its natural colour, is said to be proper. An object whose colour varies at different times and in different examples, as a rose, which may be white or red, cannot be borne proper.

PROPHECY (Gr. *propheteia*) is a word of pregnant signification. According to its usual acceptation in modern English, it implies *prediction*—the telling of events about to happen beforehand. But neither according to the original meaning of the word prophet in Hebrew (*nabi*) or in Greek (*prophetes*), nor according to historical usage of the verb *prophecy* in English, can such a meaning be considered exclusive. The etymological force of the Hebrew word, according to the best authorities, denotes ‘a person who, as it were, bursts forth with spiritual utterances under divine influence, or simply one who pours forth words.’ The *Nabi* is the medium of special divine communication—according to some, the man inspired by God to whom divine communications are made; but more distinctively, according to others, the man who delivers the burden of the divine thought imparted to him, who makes known the declarations of God. Besides the more authoritative expression *Nabi*, there are two other expressions (*Roeh* and *Chozeh*) used in the Hebrew original with something of the same meaning, and which are translated in our English version ‘seer.’ The exact meaning of the several words in their relation to one another has been much disputed. The best view, upon the whole, seems to be that which considers *Nabi* to denote specially the official function of the prophet, the *order* to which he belonged; and the other expressions to point peculiarly to the nature of the prophetic gift—the intuition or vision of the divine. The one may stamp more the objective function of the prophet as a *teller* or *utterer* of the divine, the other more his subjective capacity as a *seer* of the divine.

The original and proper import of the word *prophecy*, therefore, may be said to be the utterance of the divine. The prophet is the ‘interpreter of the divine will.’ He is expressly called ‘the interpreter and the messenger of Jehovah.’ The idea of prediction is not of course excluded; but this idea is not a radical and necessary part of the meaning of the word, nor was it at all necessarily an element

of the prophetic office. This is apparent from the use of the word even in our English Bibles and our older theological literature. The sons of Asaph, for example, it is said (1 Chron. xxv. 3), 'prophesied with a harp, to give thanks and to praise the Lord,' in the sense of merely singing or uttering God's praise under the dictate of the divine Spirit. It is said also of Philip the Evangelist (Acts xxi. 9) that he had 'four daughters, virgins, which did prophesy,' in the sense merely or mainly of declaring the gospel. In like manner, Bacon speaks in his day of 'an exercise commonly called *prophesying*,' which consisted in the exposition of a portion of Scripture by successive ministers at a meeting appointed for the purpose; and the well-known title of one of Jeremy Taylor's books, *The Liberty of Prophesying*—i. e., the liberty of preaching—recalls the same use of the word.

Prophecy among the Jews was a distinct office or function constituted under the divine sanction. The prophets were an order instituted, or at least reformed and more thoroughly organised by Samuel. There were prophets, indeed, before; Abraham is called a prophet (Gen. xx. 7), and Moses also (Deut. xviii. 15; xxiv. 10); Aaron is the 'prophet of Moses' (Ex. vii. 1), and Miriam is 'a prophetess' (Ex. xv. 20); but it was Samuel who first established the office as a systematic part of the Jewish religion. For this purpose, he gathered together companies of young men of promising spiritual attainments, who were trained under his superintendence for various religious duties—the exposition of the theocratic law, and the conduct of the theocratic worship, especially of its elaborate musical departments (1 Sam. x. 5; 1 Chron. xxv. 6). The use of the psaltery and tabret, pipe, harp, and cymbal, was the peculiar business of the prophets. The young men were set apart to make proficiency in these instruments; they were placed under an elderly head or president, who received the name of father, and they were called his sons. They were 'all under the hands of their father for song in the house of the Lord, with cymbals, psalteries, and harps, for the service of the house of God' (1 Chron. xxv. 6). The prophetic institutions have been called by modern divines 'Schools of the Prophets;' but this name does not occur in Scripture, nor even in our authorised version. 'Sons of the Prophets' is the only collective name applied to the separate companies into which they were formed by Samuel. These companies were located in special spots: in Ramah, the birthplace and residence of Samuel; in Bethel, Gilgal, Jericho, and ultimately Jerusalem. They lived in huts made of the branches of trees; wore a simple, characteristic dress; had their meals together, and were found in numbers sometimes of 50, sometimes even of 400. For a prophet not to have been trained in one of these institutions, was deemed, as Dean Stanley says (*Jewish Church*, vol. i. p. 429), 'an exceptional case.' Some, like Isaiah in Jerusalem, or Elisha in Samaria, lived in great towns, in houses of their own. The higher prophets had inferior prophets or servants attendant upon them, whose duty it was to pour water upon their hands, and secure provisions for them (2 Kings, iii. 11; v. 22). Thus, Moses had Joshua and others; Elijah had Elisha; Elisha had Gehazi. Many of them were married, and had families; for example, Moses, Samuel, Deborah, David, Hosea, Isaiah, Ezekiel. The wife was sometimes, as in the case of Isaiah, called 'the prophetess.'

The prophets, according to this description, were a peculiar order of teachers among the Jews; prophecy, a distinctive part of the divine economy, by which God trained and educated the 'chosen

people.' Beginning in a definite, though still unorganised form, with Moses (for it is only incidentally that Abraham is called 'a prophet'), it assumes a regular organisation in the hands of Samuel, just when the earlier form of the theocratic government was passing away, and the monarchy was established. It grew up alongside the older institution of the Levitical priesthood without any professed or formal opposition to the latter, but playing a part distinct, and often practically opposed to it. The priests ministered at the altars of sacrifice, and discharged all the official rites of purification enjoined by the Jewish law. They were only secondarily teachers of the people. The prophets, again, while joining in the rites of the tabernacle and temple, were primarily and mainly teachers. Their function was moral, and not ritual; they upheld the ethical, spiritual, and eternal side of religion, apt to be obscured under the hardening tendencies and ambitious officialism of an influential priesthood. They were the great preachers of a righteous government of the world, and of future retribution amidst the confusions and evils of their time; and prophecy was the ever-renewing and reforming element in the constantly corrupting and decaying policy of Judaism. More particularly, the prophets were both the national historians and poets of the Jewish people, the narrators of its past deliverance, the heralds of its coming glories. The books of Joshua, Judges, Samuel, and Kings, are included among the prophetic books of the Old Testament in the Jewish canon; while the acts of David by Gad and Nathan, of Solomon and Jeroboam by Nathan and Iddo, along with other historical and biographical pieces, have unhappily perished. It is needless to point to the splendid collection of the later prophetic books, beginning with Joel, as containing, along with much direct historical matter also, the most exalted specimens of poetry to be found in any language.

But that which by many has been supposed to be the distinctive character of prophecy, and the special function of the prophets, remains to be noticed. According to the general view of theologians in modern times, prophecy is peculiarly *predictive*, and the essential characteristic of the prophet is supposed to be the power of *foretelling future events*. 'This view is not warranted, we have seen, either by the etymology of the word, or a comprehensive survey of the facts; but it is, nevertheless, undeniable that the Hebrew prophets directed their attention especially to the future, and 'made predictions concerning the fortunes of their own and other countries, which were unquestionably fulfilled.' 'There can be no reasonable doubt, for example,' writes one of the most liberal of modern theologians, 'that Amos foretold the captivity and return of Israel, and Micah the fall of Samaria, and Ezekiel the fall of Jerusalem, and Isaiah the fall of Tyre, and Jeremiah the limits of the captivity. It was the distinguishing mark of the Jewish people,' adds the same writer, 'that their golden age was not in the past, but in the future; that their greatest hero (as they deemed him to be) was not their founder, but their founder's latest descendant. Their traditions, their fancies, their glories, gathered round the head, not of a chief, or warrior, or sage that had been, but of a king, a deliverer, a prophet, who was to come. Of this singular expectation, the prophets were, if not the chief authors, at least the chief exponents.'* The reality of a succession of Messianic predictions, is admitted by even very advanced theologians; and the more usual opinion, it is well known, regards

* Dean Stanley, *Jewish Church*, vol. i. p. 466.

these predictions from the time of Moses to the time of Malachi as admitting of no question, from the supposed clearness, fulness, and particularity with which they announce a deliverer, and describe his functions. 'That salvation should come through the family of Abraham, Isaac, Jacob, Judah, David; that at the time of the final absorption of Jewish power, Shiloh (the tranquilliser) should gather the nations under his rule; that there should be a great prophet typified by Moses, a king descended from David, a priest for ever typified by Melchizedek; that there should be born into the world a child, to be called Mighty God, Eternal Father, Prince of Peace; that there should be a righteous servant of God on whom the Lord should lay the iniquity of us all; that Messiah, the Prince, should be cut off, but not for Himself; that an everlasting kingdom should be given by the Ancient of Days to one like the Son of Man. It seems impossible to harmonise so many apparent contradictions. Nevertheless, it is an undoubted fact, that at the time seemingly pointed out by one or more of these predictions, there was born into the world a child of the house of David, and therefore of the family of Abraham, Isaac, Jacob, and Judah, who claimed to be the object of these and other predictions; who is acknowledged as Prophet, Priest, and King, as Mighty God, and yet as God's righteous servant, who bears the iniquity of all; who was cut off, and whose death is acknowledged not to have been for His own, but for others' good; who has instituted a spiritual kingdom on earth, which kingdom is of a nature to continue for ever, and in whose doings and sufferings on earth a number of specific predictions were fulfilled. Then we may say that we have here a series of prophecies which are so applicable to the person and earthly life of Jesus Christ, as to be thereby shewn to have been designed to apply to Him; and if they were designed to apply to Him, prophetic prediction is proved.'—Smith's *Dictionary of Bible*, art. Prophecy.

Such is the common view of prophecy. It has, indeed, been maintained by certain writers that *literal prediction* has no place in prophecy; that Isaiah did not foretell the Babylonian Captivity, or the fall of Tyre, nor Jeremiah the Seventy Years' Captivity, nor Nahum the ruin of Nineveh; and that the Messianic prophecies were merely 'ardent hopes and poetical descriptions' of a glorious future, into which the prophetic mind naturally projected itself. Such delineations were 'in essence nothing but *forebodings*—efforts of the spiritual eye to bring up before itself the distinct form of the future: to make such presentiments into *historical declarations*, is to mistake their character.'—Davidson's *Introduction*, vol. iv. But this is not the ordinary theory of prophecy, either among Jews or Christians. Both alike recognise the reality of the predictive element, however differently they may interpret and apply the prediction. They contend not only for a special spiritual elevation in the prophet—an intenser degree of the same divine intuition which God gives to all who worship Him in love and reverence—but for a gift of light vouchsafed to him different from any ordinary endowment. Prophecy is not merely the effluence of the divine Spirit enriching and exalting all the natural faculties, but it is the direct communication of God Himself, to the prophet unveiling the future for the guidance of His church, and the glory of His name.

The further study of the subject may be pursued by readers in numerous volumes, amongst the following may be recommended: John Smith, *Select Discourses on Prophecy*; Lowth, *De Sacra*

Poesi Hebræorum; Davison, *Discourses on Prophecy*; Butler, *Analogy of Religion*; Horne, *Introduction to Holy Scripture*; Eichhorn, *Die Hebräischen Propheten*; Ewald, *Die Propheten des Alten Bundes*; Hengstenberg, *Christology of the Old Testament*; Fairbairn, *Prophecy*; Davidson, *Introduction to the Old Testament*; Stanley, *Lectures on the Jewish Church*.

PROPLEURA, a genus of extinct tortoises from the Cretaceous of New Jersey, type of a peculiar family, which combines the characters of marine and fresh water forms in the structure of the limbs, and has, in addition, one or two more pairs of costal bones.

PROPOLIS, a substance used by bees in the construction of their combs, to give to the fabric a strength which it could not have if made of wax alone. See BEE. It is also used for closing up chinks of the hive. It is a resinous unctuous substance, of a reddish-brown colour, a somewhat bitter taste, and an agreeable aromatic odour, and is collected from the buds of trees. It is brought to the hive on the legs of bees, and adheres to them so strongly that the assistance of other bees is necessary for its removal. The name is from the Greek *pro*, before, and *polis*, a city; because the most exposed parts of a bee-hive exhibit this substance in greatest abundance. Foreign bodies introduced into a bee-hive, and which the bees are unable to remove, are covered with propolis.

PROPORTION, in Arithmetic and Geometry, is a particular species of relation subsisting between groups of numbers or quantities. Notwithstanding that the idea of proportion is found to exist in perfection in the mind of every one, yet a good definition of it is a matter of extreme difficulty. The two definitions which, on the whole, are found to be least objectionable are that of Euclid, and the ordinary arithmetical definition. The latter states proportion to be the 'equality of ratios,' and throws us back on the definition of the term *Ratio* (q. v.); which may most simply be considered as the relation of two numbers to each other, shewn by a division of the one by the other. Thus, the ratio of 12 to 3, expressed by $\frac{12}{3}$, or 4, denotes that 12 contains 3 four

times; and the ratio of 8 to 2 being also 4, we have from our definition a statement that the four numbers, 12, 3, 8, and 2, are in proportion, or, as it is commonly expressed, 12 bears to 3 the same ratio that 8 does to 2, or 12:3::8:2. In the same way, it is shewn that 3:8::13½:36; for 3 expresses the ratio of the first to the second, and

$$\frac{13\frac{1}{2}}{36} = \frac{27}{72} = \frac{3}{8}.$$

It will be gathered from the two arithmetical proportions here given, and from any others that can be formed, that 'the product of the first and last terms (the extremes) is equal to the product of the second and third terms (the means);' and upon this property of proportional numbers directly depends the arithmetical rule called 'proportion,' &c. The object of this rule is to find a fourth proportional to three given numbers—i. e., a number to which the third bears the same ratio that the first does to the second, and the number is at once found by multiplying together the second and third terms, and dividing the product by the first. Proportion is illustrated arithmetically by such problems as, 'If four yards cost six shillings, what will ten cost?' Here, 15 being the fourth proportional to 4, 6, and 10, fifteen shillings is the answer. The distinction of proportion into *direct* and *inverse* is not only quite unnecessary, but highly mischievous, as it tends to

create the idea, that it is possible for more than one kind of proportion to subsist. *Continued proportion* indicates a property of every three consecutive or equidistant terms in a 'Geometrical Progression' (q. v.)—for instance, in the series 2, 4, 8, 16, 32 . . . , 2 : 4 :: 4 : 8, 4 : 8 :: 8 : 16, &c., or 2 : 8 :: 8 : 32, &c. In the above remarks, all consideration of *Incommensurable Quantities* (q. v.) has been omitted.—The definition given by Euclid is as follows: Four magnitudes are proportional, when, any equimultiples whatever being taken of the first and third, and any whatever of the second and fourth, according as the multiple of the first is greater, equal to, or less than that of the second, the multiple of the third is also greater, equal to, or less than that of the fourth—i. e., A, B, C, D are proportionals, when, if mA is greater than nB , mC is greater than nD ; if mA is equal to nB , mC is equal to nD ; if mA is less than nB , mC is less than nD ; m and n being any multiples whatsoever. The apparent cumbrousness and circumlocution in this definition arise from Euclid's endeavour to include incommensurable quantities; throwing them out of account, it is sufficient to say that four magnitudes are proportional, if, like multiples being taken of the first and third, and like of the second and fourth, when the multiple of the first is equal to the multiple of the second, the multiple of the third is equal to the multiple of the fourth. Abundance of illustrations of the general definition will be found in the Fifth Book of Euclid, and of the particular one in the notes appended to some of the later editions of the same work; it will be sufficient here to give an arithmetical instance of the working of the particular definition. Taking the four numbers of a previous example—12, 3, 8, 2; of 12 and 8 take multiples by 4, and of 3 and 2 by 16, then 12×4 (the multiple of the first) = 3×16 (the multiple of the second), and 8×4 (the multiple of the third) = 2×16 (the multiple of the fourth). In this example, the two multiples were so taken that the multiple of the first would be equal to the multiple of the second, and when it was found that the multiple of the third was also equal to the multiple of the fourth, the proportionality of the four numbers was established.

PROPOSITION. This is the technical name for the final constituent, or ultimate element, of whatever we call knowledge—what we can believe or disbelieve. 'Fire melts wax;' 'the harvest is good;' 'Rome stands on the Tiber;' 'the moon is not inhabited'—are propositions. All information, whether historical, scientific, or practical, may be resolved at last into simple statements such as these; and all such statements are propositions. In every proposition, there are two parts: something spoken about, called the Subject; and something said, affirmed, or declared of what is spoken about, called the Predicate. In the first example given, 'Fire' is the subject, 'melts wax' is the predicate or affirming part, to which a verb is necessary. In the second example, 'Harvest' is the subject, 'is good' the predicate. But sometimes this last part is resolved further into Predicate (good) and Copula (is). The predicate then simply means the quality or fact affirmed, while the copula gives the affirmation. In the previous case, the copula is contained in the predicate (melts).

Propositions are *affirmative* or *negative*, according as we declare that a thing is, or that it is not: 'the moon is (not) inhabited.' As some propositions contain the form of a condition, and some the form of an alternative, these are called *hypothetical*, in opposition to which the rest are called *categorical*. If A is B, C is D, is the *conditional* form of the

hypothetical class. Either A is B, or C is D, is called the *disjunctive* form.

Propositions are further divided, according to their quantity, or according to the extent of the subject, into *universal*, *particular*, *singular*, and *indefinite*: 'all the moving powers are originally derived from the sun' (universal); 'some men are wise' (particular); 'Socrates is wise' (singular). The 'indefinite' means the uncertain or ambiguous in form, as 'wine is good'; many of this form are known to be universal, as 'man is mortal.'

In inquiring into the ultimate import or meaning of propositions, Mr John Stuart Mill has come to the conclusion that they fall under five classes, distinguished according to the nature of the quality predicated. The five universal and comprehensive predicates are—Existence, Co-existence (sometimes taking the form of Order in Place), Succession (Order in Time), Causation, Resemblance. Every fact, or piece of information, consists in the affirmation of some one of these five general attributes. Existence by itself expresses a very limited class, since we usually specify circumstances of time, place, &c., in the same assertion: 'There is an ether for conveying light and heat,' is a proposition of Existence; but it would be more usually stated as having locality (Order in Place, or Co-existence), 'an ethereal medium is diffused over all space.' Existence is the only one of the five attributes that can be affirmed of one thing; all the rest require at least two things. The attribute of Co-existence appears in a very large number of propositions: all geographical statements and local descriptions; all the natural conjunctions of properties (the animal frame consists of digestive organs, a nervous system, &c.), affirm co-existence. The attribute of Succession is seen in history, and in all the changing aspects of things. The attribute of Causation is a special case of Succession, so important as to be raised to the rank of a first-class predicate. The facts of physical and mental science involve not merely succession, but cause and effect: 'Heat expands bodies;' 'practice improves the human faculties.' The concluding attribute—Resemblance—is of very wide occurrence. The propositions of numerical or mathematical science all involve some assertion of equality or inequality, proportion or disproportion: 'Twice three is (equal to) six;' 'triangles in the same base and between the same parallels are equal.' Throughout all our knowledge, the affirmation of likeness, or of unlikeness, is a fundamental fact; but, in mathematics, it constitutes the characteristic predicate, or the sole affirmation.

PROROGATION, the continuance of parliament from one session to another. Parliament is prorogued by her Majesty's command, signified in her presence by the Lord Chancellor, or Speaker of the House of Lords, to both Houses, or when her Majesty is not personally present, by writ under the Great Seal, or by Commission. Prorogation not only suspends all business, but quashes all proceedings pending at the time, except impeachments by the Commons, and writs of error and appeals before the House of Lords. A bill must be renewed after a prorogation, as if it had never been introduced. A prorogation for a single day has sometimes been resorted to, to enable a bill to be brought in a second time, it being a rule that no second bill of the same substance with a prior one can be introduced in the same session. Thus parliament was prorogued by William III. from the 21st to the 23d of October 1689, in order to renew the Bill of Rights, regarding which a difference had arisen between the Upper and Lower House that was fatal to it. By 37 Geo. III. c. 127, after parliament has been prorogued

to a particular day, her Majesty may, by proclamation, call it together on any other day, not less than 14 days distant, to which day parliament then stands prorogued. See PARLIAMENT.

PROSECUTION, though often used in a general sense, as applicable to all kinds of litigation, is also used technically to denote the institution of criminal proceedings against a party. There are two ways in which a prosecution commences in England. One is to summon, or, in the graver cases, to arrest and bring the offender before a justice of the peace, when the witnesses are examined, and if the justice thinks a *prima facie* case is made out, he commits the offender for trial. Another way is without any such preliminary inquiry before a justice, for the prosecutor to go with witnesses before a grand jury, and in all cases this is a step in the prosecution. The grand jury hear the witnesses, and if they think there is a *prima facie* case, they find a true bill; if otherwise, they ignore the bill. The bill means an indictment. When the indictment is found, the prisoners are arraigned at the bar, and asked by the judge whether they plead guilty or not guilty; and in general they plead not guilty. A jury of twelve are then sworn, and try the case, and find a verdict of guilty or not guilty, whereupon the judge sentences the prisoner to punishment, which varies according to the enormity of the offence. In general, a new trial cannot be held in criminal cases, though, if an error is committed, the conviction is often quashed.

PROSECUTOR is the person who takes the initiative in punishing crimes. In England, there is no public prosecutor, and the prosecution of crimes is left to the spontaneous action of the injured party. Hence it often happens that many crimes go unpunished, for the mere want of its being anybody's business to attend to this part of the public interest. It is true that the attorney-general is sometimes the prosecutor on behalf of the public, but this only happens in rare and exceptional cases connected with political government or some monstrous and abnormal crime. In all cases, therefore, it may be accurately stated that it is left to the uncontrolled discretion of anybody to commence a prosecution, however great a stranger to the circumstances. But though he may take the initiative, yet in the ordinary course, a stranger seldom undertakes such a duty, and for very sufficient reasons. If a party is robbed by a servant or clerk, or by burglars, he naturally desires to prosecute them; if a person is murdered, some one of the relatives naturally prosecutes. Therefore, there is in most cases a sufficient motive impelling some party, or friend of the party injured by the crime, out of mere revenge, if for no other reason, to commence a prosecution. But it follows that, as there is no public prosecutor, and as he who acts as such is a volunteer, he does so more or less at his own expense, and in the first instance must always do so. He must employ his own attorney and counsel, who, of course, require to be paid for their services. It is true that the expenses of prosecuting most crimes are supposed to be ultimately repaid by the county in which the trial takes place; but this allowance is a wretched pittance, and is seldom one-fourth of the real expenses incurred by the private prosecutor. Hence, in the end, the prosecutor finds that he loses a great deal of money as well as time in carrying on a prosecution. Indeed, in practice, the result is, that no person to whom his money is of much consequence ever prosecutes a second time, and the first time he almost invariably does so in ignorance of the pecuniary result, there being a vague kind of popular belief that the expenses are repaid. Few people, indeed, fail to

repent of embarking in such a litigation; and the prudent and experienced are in the habit of remarking, that prosecutions are only kept going by the unbroken succession of young and inexperienced persons who do not know better. A person who prosecutes a small larceny of five shillings may incur expenses of from five to fifteen pounds, which is money out of pocket when his attorney's bill is paid. But not only is there great expense and loss in the mere prosecution itself; there are far more grievous consequences. If it happen—and it seems in about half of the cases it really does happen—that the prisoner is not found guilty, or the case breaks down from defective evidence or otherwise, the first thing that the prisoner does is to bring an action for false imprisonment or for malicious prosecution, against the prosecutor. It is said that attorneys infest all the police courts and petty sessions, by keeping an organised service of watchers to pick up cases of this kind, which are called speculative actions. The speculative attorney promises to take the chance of gaining the action, and, of course, as it costs the prisoner nothing, he readily lends his name, and, out of revenge, joins keenly in the attempt to recover large damages. It is true that in all such cases the prosecutor ought not in theory to lose the verdict, if he acted under a reasonable and honest belief that a crime had been committed; but however plausible this defence may be in theory, it is a very different thing to establish it in practice. At the trial of the action, counsel on such occasions enlarge on the monstrous oppression of having given an innocent man into custody, blasting his character and reputation for life, and attributing the prosecution to spite or malice; and as the presumption is always in favour of innocence, it is astonishing how easily a jury may be led away by a spurious sympathy in favour of the quondam prisoner. It is thus entirely a lottery in such cases how the verdict will go, and verdicts of ten, fifty, or a hundred pounds of damages are often obtained, simply because of the accidental defect of some conclusive piece of evidence, with which the defendant in the action had probably no more to do than any other person. When the quondam prosecutor is a person of substance and position—and, of course, a speculative attorney will not sue those who are not so—he often finds it prudent to compromise the action by paying a lump sum, rather than run the risk of a trial. Many attorneys in the metropolis and large towns of England carry on a large and lucrative business by systematically bringing these speculative actions against unsuccessful prosecutors. The evils of this state of the law have been often complained of, but have not yet been remedied, probably because other systems of prosecuting crime are open to objections.—In Scotland, a well settled system of public prosecutors has long been in operation, which avoids most of the evils already described. The Lord Advocate is *ex officio* the public prosecutor, and there are counsel called advocates-depute who assist him, besides a local functionary called a Procurator-Fiscal (q. v.) in all parts of the country. The public prosecutor's duty and business is to act on all reasonable suggestions that a crime has been committed, but he is not compelled to prosecute. If he refuse to do so, a private party may at his own risk, with the concurrence of the Lord Advocate, insist on the prosecution; but he may be called on to find caution or give security. The usual course is for the procurator-fiscal to take the precognitions; i. e., the examination of witnesses before the sheriff, a copy of which is laid before the crown-counsel, and if they are satisfied that a *prima facie* case is made out,

the proceeding is carried on to trial; but if there is not sufficient evidence, the prisoner is ordered to be at once discharged. The entire expense of prosecuting crime in Scotland, whether at the higher or local tribunals, is borne by the public; the persons specially injured having nothing whatever to do in the matter except to appear as witnesses when called upon. This system has worked for three centuries with entire satisfaction.

PROSELYTES (Gr. *proselytos*, one who comes from without, a stranger; Hebr. *Gerim*) was the name given by the Jews to those heathens who became converts to Judaism. There were two kinds of proselytes distinguished: 'Proselytes of the Gate,' that is, heathen strangers, who, in order to be allowed to reside in Palestine, had undertaken to submit to the 'Seven Commandments of the Sons of Noah,' that prohibit blasphemy, idolatry, murder, incest, theft, disobedience to the authorities, and the eating of flesh with the blood on it: commandments which probably had grown out of certain restrictions originally put upon the 'strangers' by the Mosaic Law (Exodus, xii. 19; xx. 10, &c.). These 'Proselytes of the Gate,' or 'Sojourners,' could not claim all the privileges of an Israelite, could not redeem their first-born, and, at a later period, were not allowed to live in Jerusalem; yet they were permitted to offer whole burnt-offerings, and otherwise contribute towards the religious wants of the commonwealth. The second class of proselytes was formed by the *Gere hatsedek* (Pious Proselytes), or *Gere haberith* (Proselytes of the Covenant). These accepted all the dogmas and customs of Judaism to their fullest extent, and were called 'Complete Israelites.' The new candidates were first strictly asked for their motives, and the classification of those who were not to be admitted runs as follows: those whose motive is love (husband for the sake of following his wife's faith, or *vice versa*); Proselytes of the Tables of the Kings (i. e., those who covet court-favour); Esther-Proselytes (who wish to escape some threatening danger, cf. Esther, viii. 7); and Lion-Proselytes (those who, from a superstitious fear, wish to enter Judaism, like the Samaritans, 2d Kings, xvii. 26). If, on the other hand, the motives were satisfactory, the candidate was further cautioned against attaching himself to a persecuted people, and warned that sufferings of all kinds would be his lot in this life. If all this did not deter him, he was 'brought under the wings of God.' He was fully instructed in the religion and history of the people, and shewn the special Providence that guided them and watched over them. If a male, he was circumcised, and, in case of his being circumcised already (for instance, if he belonged to another nation practising this rite), a few drops of blood were drawn 'from the blood of the covenant,' a special prayer was said for him, and a new name was given to him, while for that of his father, Abraham was substituted. After the healing of the wound, Baptism (Tebilah) followed, and he had further to offer up a Sacrifice (Korban). Females had likewise to undergo baptism and to bring a sacrifice. All natural relations were then cancelled, the Proselyte was considered like 'a new-born child,' and the Holy Ghost was supposed to come upon him.

The desire to proselytise, which became strong among the political leaders during the Maccabean period, and which led to the 'bringing into the Congregation' of entire nations, such as the Idumeans under John Hyrkan, the Iturians under Aristobulos, contrasted strongly and most characteristically with the utter contempt in which the new-comers were held by the people, and with the suspicion with which they were regarded, and

their (after all) limited social rights and ambiguous position. The Talmud speaks of them in no measured terms, and there is no doubt that, on the whole, they must have acted a very dubious part. They were called the Leprosy of Israel; it was the Proselytes and other reprobates who stood in the way of the coming of the Messiah; and up to the twenty-fourth generation were they to be distrusted. Yet, notwithstanding all this, conversions were very frequent, especially among the better classes—and here, again, among women principally—in Damascus, Greece, Asia Minor, Rome; so much so, that even the Roman legislation was compelled, in the 1st c. B. C., to provide for cases of Judaizers. It is a curious fact, worth remembering, that one of the main features of the times of the Messiah was to be, according to Jewish tradition, the utter abolition of proselytism, and the entire ceasing of all distinctions of an opprobrious nature among men. The evil repute into which the term Proselyte had fallen in the times of Christ also caused the early converts to Christianity to adopt the name of Neophytes (newly planted) instead.

PROSERPINA, the Latin form of the Greek **PERSEPHONE** (also **PERSEPHATTA**, **PERSEPHASSA**, **PEREPHASSA**; in Homer, **PERSEPHONEIA**), was, according to the common myth, the daughter of Zeus and Demeter (Ceres) or of Styx. The story of her abduction by 'gloomy Dis,' while gathering flowers on the plains of Enna, in Sicily, in company with Artemis and Athena, does not occur in Homer, who simply represents her as the wife of the king of Hades, and as the majestic queen of the Underworld—a subterranean Hera (Juno). It is first given by Hesiod, and is manifestly an allegory of the seasons. See **CERES**. In the 'mystical Orphic Hymns, P. appears as the all-pervading goddess of nature, who produces and destroys everything, and she has been mixed up and identified with other mystical goddesses, Rhea, Artemis, Hekate, &c. She was generally worshipped under the name of *Kore*, 'maiden,' along with her mother Demeter. The chief seats of her worship were Sicily and Magna Græcia; but she had also temples at Corinth, Megara, Thebes, and Sparta. In works of art, P. is represented sometimes as the grave and earnest spouse of Pluto, sitting on a throne beside her sombre husband, with a sceptre and a little box; but more frequently as a blooming virgin, the picture of her mother, in the act of being carried off to Hades.

PROSODY (Gr. *prosōdia*, literally, 'belonging to song or hymn') is the name given, both by the ancients and moderns, to that part of grammar which treats of the rules of rhythm in metrical composition. See **METRE**, **RHYME**, **BLANK VERSE**.

PROSPECT, in Roman Law, was recognised as a legal incident of a house, or an urban servitude, so that no adjoining owner was entitled to obstruct the prospect or view of a man's house. But if this meant more than that the light should not be sensibly obstructed, it is not recognised in English or Scotch law. See **LIGHT**.

PROSSNITZ, a manufacturing town of Austria, in Moravia, in the fruitful plain of Hanna, stands on the Rumza, 12 miles south-west of Olmütz. It contains a convent, and a linen, and several cloth factories. Brandy is extensively distilled. Pop. 15,717.

PROSTITUTES, **LAW AS TO**. It is not an offence, in this country, for a person to carry on a course of prostitution in his or her own person; but when others are incited, or forced to that course, it may become so, in certain circumstances. Thus,

for a person to keep a disorderly house, is an indictable offence, which is punishable by fine and imprisonment. It is, however, only the person who keeps the house who is punishable, and no punishment can be imposed on the frequenters of the house. The law may be said to be passive as far as the mere fact of prostitution is concerned, and gives neither party any remedy against the other, civil or criminal, arising out of that state of the relations between man and woman. Thus, if a man give a woman a bond, providing her an annuity in consideration of her living with him in concubinage, the law will not enforce it, because it is an immoral consideration. So, if a woman take lodgings, or buy dresses, for the purpose of carrying on a course of prostitution, the law will not enforce the payment. In some countries, as in France, the law takes direct cognizance of the fact of prostitution, and deals with prostitutes for various sanitary purposes; and in England, in 1864, a statute was passed, which to a certain extent introduced the French procedure.

PROTAGORAS, the Greek Sophist, was a native of Abdera, where he was born probably about 480 B. C. He was the first who took the name of 'Sophist.' Accused of atheism by one of his own scholars, he was banished from Athens, and his writings were ordered to be publicly burned. He died probably in 411 B. C. The basis of his speculation is the proposition, that 'man is the measure of all things,' which was developed by him in a way that involved the most thorough-going scepticism. The *Theætetus* and *Protagoras* of Plato are devoted to a refutation of P.'s doctrines.

PROTEACEÆ, a natural order of exogenous plants, containing about 650 known species of shrubs and small trees, chiefly natives of South Africa and of Australia. Some of them, as species of *Protea* and *Banksia* (q. v.), are frequently cultivated in gardens and greenhouses, being prized for their singular and elegant appearance, and their curious and often beautiful flowers. They have usually umbellate branches; their leaves are evergreen, and remarkably hard, dry, and woody, divided or undivided, and without stipules. The perianth is four-leaved or four-cleft; the stamens, four, one of them sometimes sterile, perigynous, opposite to the segments of the perianth; the ovary superior, consisting of a single carpel; with one, two, or many ovules; the style simple, the stigma undivided; the fruit dry or succulent, and opening or not opening, many fruits often collected in a kind of cone. The nuts or seeds of some species are eaten, as those of *Brabejum stellatum* in South Africa, and of *Guevina Avellana* (also called *Quadria heterophylla*) in Chili. Those of the latter are much esteemed, and are called *Avellans* and *Nebu*.

PROTECTION—PROTECTIVE DUTY. Protection is the fostering of a nation's industries by duties on the importation of the products of those foreign industries which compete with them. It assumes that the latter, by reason of some temporary advantage, such as priority in the field or the command of cheaper capital, can carry competition so far as to prevent the establishment of rival industries in a weaker or less advanced country. It also assumes that the nation which protects industries as yet nascent, but suited to its climate and its people, will, in the long run, derive more benefits from their naturalisation on its soil than from the present cheapness of products.

The immediate benefits of protection are—(1) it brings the manufacturing and agricultural classes so much nearer to each other that the expense of their mutual exchanges is greatly reduced, and each supplies the wants of the other more cheaply, and yet with larger profits; (2) it creates within the nation that diversity of occupation which makes labour most

effective, obtains for it the best wages, and secures to the varied capacities of the working-classes full scope and exercise; (3) it creates the greatest possible amount of employment for all sorts of labour, and thus diminishes the number of those who live in enforced idleness because they have not the strength needed for hard out-door work; (4) it makes the nation independent of others for all those articles of prime necessity whose absence would embarrass it in time of war. The ultimate benefits are—(1) the accumulation of cheap capital, which enables the country's industry to be carried to the greatest perfection of organisation; (2) the increase of the supply of commodities and the lowering of their prices; (3) the making international commerce more equitable by enabling the country to send abroad highly elaborated products, which cost less in transportation.

This policy has been the practice of all the great nations and of a majority of the great statesmen of the civilised world. Edward III., Elizabeth, Cromwell, Locke, Ormond, Henri IV., Colbert, Necker, Napoleon, Thiers, Friedrich II., Gustavus Adolphus, Washington, Hamilton, Jackson, and Clay are a few of its more illustrious adherents. England, which is still the only Christian nation that has definitely given it up, did herself practice it for five hundred years, and thus fostered into life and aggressive power every great industry on her soil. France, Belgium, Germany, Sweden, and Switzerland thus built up their manufacturing systems; and less advanced nations, like Spain, Portugal, Italy, and Russia, are now treading the same path. Its adoption in America was one of the avowed objects of the substitution of the present Constitution for the old Articles of Confederation, which left the question to the colonies severally. For two brief and disastrous periods, 1815–24 and 1833–40, the opposite policy was adopted, but protection has been the historic policy of the republic. To it we owe the unexampled rapidity of industrial development, which now enables us to compete in the markets of Europe and her colonies with the older and long-protected manufactures of England and our other commercial rivals.

Protection as a permanent system is denounced by all the English and many other economists. But if adopted as a temporary expedient for the naturalisation of suitable industries, it has the sanction of even the greatest among these, such as Adam Smith, Jean Baptiste Say, Rossi, Blanqui, Michel Chevalier, and John Stuart Mill. 'Such tariffs,' says *The Pall Mall Gazette*, 'have taught many countries the strength of which they were ignorant. But for the artificial profits which protective duties give, much of the producing power of the world would have remained dormant or sterile.'

The economic arguments against protection mostly resolve themselves into one: 'The sole interest of the consumer is cheapness, and his interest is that of society, while that of the producer is the interest of a class.' If this were so, then those periods of business depression in which all commodities are to be had cheap should be times of prosperity for society at large. But such times show us that a nation prospers only when her productive classes are prosperous. The case of such countries as Ireland, India, and Turkey, of America in 1783–90, and of Portugal before 1837, with all the legislation in favour of the consumer and nothing done for the producer, are merely cases of a chronic condition similar to the periodic relapses of industrial communities. The classes which form the industrial state are so interdependent that none can suffer without involving all the rest in its distress.

Of protectionist authors the chief are List, Dühring, and Stoepel in Germany; Carey, Greeley, Wharton, and Elder in America; and Judge Byles in England.

R. E. THOMPSON.

PROTECTOR, a title which has sometimes been conferred in England on the person who had the care of the kingdom during the sovereign's minority. The Earl of Pembroke was Protector in 1216, in the minority of Henry III. Humphry, Duke of Gloucester, held the same office in the time of Henry VI., from 1422 to 1447. Richard, Duke of Gloucester, was Protector in 1483, prior to his ascending the throne as Richard III. The Duke of Somerset was in 1548 constituted Protector during the minority of Edward VI. Oliver Cromwell, in December 1653, took the title of Lord Protector of the Commonwealth of England, Scotland, and Ireland.

PROTEIN AND THE PROTEIN BODIES.

Under the term *Protein Bodies*, chemists include the following substances: Albumen, Fibrin, Syntonin or Muscle-fibrin, Casein, Globulin, and Hæmato-crystallin. Albumen, fibrin, and casein are common both to the animal and vegetable kingdom; while the three others occur only in the animal kingdom (namely, in muscular tissue, in the crystalline lens of the eye, and in the blood-cells). The most careful analyses have shewn that in their composition, these substances are almost identical, and that they all contain about 53·6 per cent. of carbon, 7·1 of hydrogen, 15·6 of nitrogen, and 22·1 of oxygen, with a varying quantity of sulphur not exceeding 1·6 per cent. These substances are as similar in many of their properties, and in the products of their decomposition, as in their ultimate composition, and hence chemists were naturally led to entertain the view that they possessed a common radical. Mulder (q. v.) announced, in 1833, that he had discovered this radical, which, from its importance, he named **PROTEIN** (Gr. *proteuo*, I hold the first place), and that he had found that albumen, fibrin, casein, &c. (which at that period were known as the *albuminous bodies*, the *albuminoid group*, or the *albuminates*), were combinations of this protein with sulphur and phosphorus, or simply with sulphur. The composition of this protein is represented according to the discoverer, by the formula $C_{86}H_{128}N_{16}O_{16}$. Liebig and several of his pupils have, however, shewn that Mulder's protein always contains a small but variable amount of sulphur; and they deny, on what are generally deemed sufficient grounds, the existence of protein as a separate body. The term *protein bodies*, or *protein compounds*, is, however, commonly retained both by physiologists and chemists, as being the most convenient one for representing a class of compounds, which, whether Mulder's theory is correct or not, deserve their name from their constituting the group which form the most essential articles of food.

The **PROTEIN BODIES** may be generally described as nearly colourless, neutral, nitrogenous bodies, soluble in potash solution, and not yielding gelatin when boiled with water. They all present two modifications, differing essentially from one another; in one of which they are soluble, and in the other nearly or quite insoluble. They exist naturally only in the soluble modification, although not necessarily in a state of solution. Most of them are transformed into the insoluble state by boiling, by the mineral acids, and by numerous salts; and one of them, fibrin, undergoes this modification on simple removal of the blood, or other fluid containing it, from the organism. This passage from the soluble into the insoluble form, is termed *coagulation*, but we do not know what chemical change takes place in the process.

The *soluble protein bodies*, in their dried state, form pale yellow, translucent masses, devoid of smell and taste, which are soluble in water, but insoluble in alcohol and ether. They are pre-

cipitated from their watery solutions by alcohol, by the mineral acids, by tannic acid, but not by the vegetable acids generally; and by many mineral oxides and salts. The *insoluble protein bodies*, when freshly precipitated, are of a white colour, in flakes or small clots, or viscid and glue-like: when dried, they may be reduced to a whitish powder.

PROTESTANT, a term first applied to the adherents of Luther, from their protesting against the decree passed by the Catholic states at the second diet of Speier in 1529. This decree had forbidden any further innovations in religion, and enjoined those states that had adopted the Reformation so far to retrace their steps as to reintroduce the Mass, and order their ministers to avoid disputed questions, and to use and explain the Scriptures only as they had hitherto been used and explained in the church. The essential principles involved in the protest, and in the arguments on which it was grounded, were: 1. That the Catholic Church cannot be the judge of the Reformed churches, which are no longer in communion with her. 2. That the authority of the Bible is supreme, and above that of councils and bishops. 3. That the Bible is not to be interpreted and used according to tradition or use and wont, but to be explained by means of itself—its own language and connection. As this doctrine, that the Bible, explained independently of all external tradition, is the sole authority in all matters of faith and discipline, is really the foundation stone of the Reformation, the term Protestant was extended from those who signed the Speier protest, to all who embraced the fundamental principle involved in it; and thus Protestant churches became synonymous with Reformed churches. The essence of Protestantism, therefore, does not consist in holding any special system of doctrines and discipline, but in the source from which, and the way in which it proposes to seek for the truth in all matters of faith and practice; and thus a church might, in the progress of research, see reason to depart from special points of its hitherto received creed, without thereby ceasing to be Protestant. The Symbols or Confessions of the Protestant churches were not intended as rules of faith for all time, but as expressions of what was then believed to be the sense of Scripture. When, at a later time, it was sought to erect them into unchangeable standards of true doctrine, this was a renunciation of the first principle of Protestantism, and a return to the Catholic principle; for, in making the sense put upon Scripture by the Reformers the standard of truth, all further investigation of Scripture is arrested, the authority of the Reformers is set above that of the Bible, and a new tradition of dogmas and interpretation is created, which differs from the Catholic tradition only in beginning with Luther and Calvin, instead of with the apostolic fathers. See REFORMATION.

PROTEUS, in the Homeric or oldest Greek mythology, appears as a prophetic 'old man of the sea' (*hailios gerôn*), who tends the seal-flocks of Poseidôn (Neptune), and has the gift of endless transformation. His favourite residence, according to Homer, is the island of Pharos, off the mouth of the Nile; but according to Virgil, the island of Karpáthos (now *Skarpanto*), between Krete and Rhodes. Here he rises at mid-day from the floods, and sleeps in the shadow of the rocky shores, surrounded by the monsters of the deep. This was the time when those who wished to make him prophesy sought to catch him. But it was no easy task. P., unlike most vaticinal personages, was very unwilling to prophesy, and tried to escape by adopting all manner of shapes and disguises. When he found his endeavours hopeless, he resumed his

proper form, and then spoke out unerringly about the future.

PROTEUS, a genus of perennibranchiate Batrachia (q. v.), having a long, smooth, naked, eel-like body; four small and weak legs; the

Proteus (*P. anguinus*).

fore-feet three-toed—the hinder, four-toed; the tail compressed and forming a kind of fin; the head lengthened and flattened; the eyes extremely small, and covered by the skin; the ears concealed in the flesh; the gills external and permanent, reddish, very conspicuous, between the head and the fore-legs. Notwithstanding the permanent external gills, there are also lungs in the form of simple slender tubes, terminated by a vesicular dilatation. There are several known species; one, *P. anguinus*, is found in subterranean lakes, in the great limestone caverns in Carniola, and seems to live chiefly in the mud which forms the bottom of the lakes or pools. It is of a pale rose or flesh colour, 10 or 12 inches long, seldom above half an inch in thickness. The blood-corpuscles are extremely large.

PROTEUS, a name given by many naturalists to certain animalcules remarkable for changefulness of form; on which account also they now receive the generic name *Amœba* (Gr. vicissitude). They are *Protozoa*, and rank among the *Rhizopoda*. They are found in fresh water, and are generally from $\frac{1}{16}$ to $\frac{1}{8}$ of an inch in diameter, of a somewhat globose form, which, however, they exchange for almost every imaginable shape. They are of a soft gelatinous substance, and in their movements, seem to flow over objects rather than to crawl, or even glide. When one of them is divided by a knife, there is no perceptible escape of any fluid, but each part shrinks up, and becomes a separate individual. They multiply by spontaneous division, or by detaching a lobe from the body; but a true reproduction by ova has also been discovered, the parent becoming a mere sac for the ova, and perishing. The diaphanous substance of which they consist (*sarcode*) is, except in young individuals, full of minute corpuscles or granules; there are also to be seen in it empty spaces (*vacuoles*) of no very definite form. For locomotion, a portion of the substance of the creature is protruded, and the rest of the body seems to be drawn after it. There is no mouth, stomach, or alimentary cell; but the organic particles or minute animalcules which serve for food are surrounded by the jelly-like substance, and speedily absorbed into it, every part being apparently equally adapted for finding and using food in this way, as well as for locomotion.

PROTOCOCCUS (Gr. first-grain), a genus of *Palmeaceæ* (q. v.), to which Red Snow (q. v.) is commonly referred.—Another species is *P. pluvialis*, frequent in stagnating rain-water. It passes through various stages of growth, in which it has been described under various generic and specific names. In some of its stages it has often been mistaken

for an animalcule. Its colour is usually green, but sometimes red; and the red matter often appears as a mere central nucleus, which has been mistaken for the eye of the animalcule. In its ordinary form, it consists of a mass of colourless *protoplasm* (see CELLS), with red or green granules diffused in it surrounded by a *primordial utricle* (see CELLS), and undergoing division into halves, which are soon surrounded by separate envelopes, and undergo division again; the new cells thus formed, and they are formed with great rapidity, being sometimes set free by the dissolution of the original enveloping membrane, more frequently remaining imbedded in a gelatinous substance formed from it. The new cells often send forth two vibratile filaments or cilia, which spring almost from one point, often a kind of beak; and move with considerable rapidity; and in this state also, they multiply by binary subdivision; or they rest, become *encysted*, and divide into four. If slowly dried, the *P. pluvialis* retains life, and resumes its functions when again moistened.

PROTOCOL (Gr. *prôtos*, first, and *kolla*, glue), a word used in two senses: 1. The rough draft of an instrument or transaction; and more particularly the original copy of a government dispatch, treaty, or other document. 2. A record or register. In Scotland, every notary, on admission to office, formerly received from the Clerk-register a book called his protocol, in which he was directed to insert copies of all the instruments which he might have occasion to execute, to be preserved as in a record.

PROTOGENE (Gr. first-born), a granitic rock, composed of the same ingredients as true granite, except that the mica is replaced by talc. It received its name because it was supposed to have been the *first-formed* granite. It abounds in the Alps, and is found also in Cornwall. The clay produced by its decomposition is greatly valued for the manufacture of china.

PROTOGENES, a celebrated painter of ancient Greece, was born at Kaunus in Caria, and practised his art at Rhodes. Very little is known concerning him, except that he was a contemporary of Apelles, who was the means (see *APELLES*) of first drawing the attention of the Rhodians to his extraordinary merits. Pliny says that when Demetrios Poliorketes was endeavouring to conquer Rhodes, he took the utmost precautions to prevent any injury from happening to the studio of P., who then lived in a little cottage (*casula*) on the outskirts of the city, and even stole away at times from the tumults of the siege to visit the painter, quietly and earnestly pursuing his work amid 'the din of arms and the thunder of the battering-engines.' P. died about 300 B.C. He was a careful and elaborate painter, sparing no pains to secure a brilliant, natural, and finished piece of workmanship; and was apparently held in the highest estimation by the ancients. Cicero says that his pictures were perfect in every respect. The principal were 'A Satyr resting and holding his Pipes,' 'The *Paros* and *Ammonias*' (or sacred ships of the Athenians, executed for the *Propylæa* at Athens); and 'The *Thesmothetæ*' (for the Athenian Senate-house of the Five Hundred).'

PROTOHIPPIUS, a genus established by Leidy for species of extinct horses found in the Miocene strata of North America, having some dental characters of the younger stages of Equus. Found also in S. America.

PROTOMERYX, related to the camels. One species, *P. hallii*, from the Miocene of Nebraska, is known.

PROTO-NOTARY (Gr. *prôtos*, first, and *Lat. notarius*, notary), the name given to a notary appointed by the Holy See. Among the officials of the court of Rome is a body twelve in number

called the College of Notaries, who are to be distinguished from honorary or extraordinary apostolic notaries. The former are said to date from a very early time, and are charged with the official registration of all the solemn acts of the pope, whence they have a very special duty in relation to canonisations of saints, &c. Their number was fixed by Sixtus V. at twelve, and they enjoy many privileges. An apostolic notary-extraordinary, although called proto-notary, does not enjoy the same privileges. The proto-notary extraordinary may be named not only by the pope, but also by a LEGATE (q. v.), and under certain restrictions, by the Roman College of Notaries.

PROTOPHYTES (*Protophyta*, Gr. first plants), a name now frequently employed to designate the lowest or simplest organisms in the vegetable kingdom, corresponding to the *Protozoa* of the animal kingdom. They are regarded as among the *Algæ* (q. v.). Many of them are mere simple cells, which multiply by division, although perhaps they may yet be found to have also another mode of reproduction; others consist of cells united by a gelatinous substance, and the aggregate in some is a shapeless mass; in others, a plant-like structure, the form resulting from the mode in which the division of cells takes place. In none of them do the cells assume determinate characters in any part of the structure, so as to constitute different organs; in which they differ from all higher plants. It is sometimes very difficult to distinguish P. from *Protozoa*; and perhaps the surest distinctive character is the nature of their food. Some of the *Protozoa*, having no mouth, as the *Proteus* or *Amœba*, might be regarded as plants rather than animals; but they subsist by consuming organic particles, vegetable or animal, whilst P. live by appropriating inorganic substances, chiefly from the air or water around them. Among the P. are *Palmellaceæ* (q. v.).

PROTOPLASM. See **CELLS**.

PROTOZOA (Gr. *proton*, first, and *zōn*, animal), constitute the lowest animal subkingdom, and include a large number of animal beings of the lowest and simplest type of organisation. Their bodies consist either of a simple cell or of an aggregation of cells, each of which seems to retain its independent existence. In none of the P. can a nervous system, or organs of sense, be detected; and except in one group (the *Infusoria*), there is no trace of a mouth. Excepting the sponges, they are generally of very minute size, and only to be observed with the microscope; and excepting a few that inhabit the bodies of other animals, all are aquatic animals. They generally present the appearance of a transparent gelatinous cell, containing a nucleus; in addition to which, one or more clear pulsating spaces, termed *contractile vesicles*, may be frequently seen. Excepting the infusoria, none present true reproductive organs, reproduction being usually accomplished by fissure. They are divisible into the following groups or classes, each of which is noticed in a separate article: (1) *Gregarinidæ*, (2) *Rhizopoda*, (3) *Spongiæ*, and (4) *Infusoria*; to which Green, in his *Manual of Protozoa*, adds *Polycystina*, and *Thalassicolilidæ* (both of which are commonly included in the *Rhizopoda*).

PROUD-FLESH is the popular term for coarse and too luxuriant Granulations (q. v.) springing up on wounds or ulcerated surfaces. Such granulations must be treated with nitrate of silver or sulphate of copper, either in the solid form or in strong solution.

PROUDHON, PIERRE JOSEPH, a noted French publicist and speculator on social and political

subjects, was born July 15, 1809, at Besançon, in which town his father was a poor cooper. Through the good offices of charitable friends, he received the rudiments of his education at the college of his native place, and from the first gave great promise of talent. While still very young, however, he quitted the institution in order to aid his family, which had fallen into great distress, and sought employment in a printing establishment. Here he was noted for the most punctual discharge of duty; and in the hours not occupied in work, he contrived, by a rare exercise of resolution, to complete and extend his education. In 1830, he declined an offer of the editorship of a ministerial journal, preferring an honourable independence as a workman, to the career of a writer pledged to the support of authority. He became partner in 1837 with MM. Lambert and Maurice in the development of a new typographical process; was engaged on an edition of the Bible, to which he contributed notes on the principles of the Hebrew language; and in 1838, published an *Essai de Grammaire Générale*; in approval of which, a triennial pension of 1500 francs was awarded to him by the Académie de Besançon. On this accession of funds, he paid a visit to Paris; and subsequently contributed to the *Encyclopédie Catholique* of M. Parent Desbarres the articles Apostasie, Apocalypse, and others. In 1840, he issued the work entitled *Qu'est-ce que la Propriété?* which afterwards became so famous. The nature of the doctrine announced in it is sufficiently indicated in its bold paradox, soon to be widely popularised—*La Propriété, c'est le Vol*. At the moment, it attracted little notice; and the sole results to its author were the withdrawal of his pension by the Academy, on the score of his noxious opinions, and the threat of a prosecution, which, however, was departed from, at the instance of M. Blanqui, the political economist, to whom reference in the matter was made. In 1842, for a repetition of offence in his *Avertissement aux Propriétaires*, he actually was prosecuted before the Cour d'Assises of Besançon, but succeeded in obtaining an acquittal. From 1843 to 1847, P. was employed at Lyon, under MM. Gauthier, in the superintendence of a scheme of water-transport on the rivers Saône and Rhône; publishing during this time at Paris the two works entitled *De la Création de l'Ordre dans l'Humanité*, and *Système des Contradictions Economiques*.

With the outburst of the Revolution of February 1848, the opportunity of P. had arrived. He instantly repaired to Paris, and on the 1st of April, he came before the public as editor of the *Représentant du Peuple*, instantly, by his fierce and vigorous advocacy of extreme democratic and socialistic opinions, making his mark as a leading figure of the hour. His paper was suppressed in August following; but meantime, on June 4, no less than 77,094 enthusiastic admirers had voted him into the Constituent Assembly as representative of the department of the Seine. His career as a senator, if brief, brought him at least notoriety. *La Propriété, c'est le Vol*, though a maxim much commending itself to the moral sense of the hungry masses, naturally failed to find like acceptance with an audience mostly with some sous in the pocket. P. soon ceased to address the Assembly, for, so soon as he ascended the tribune, the indignant roar which saluted him rendered audible speech impossible. Under these circumstances, P. once more betook himself to his pen, and, as editor of three daily journals in succession, avenged himself on the adversaries who declined *vis à voce* to listen to him, the chief victims of his savage personalities being MM. Ledru Rollin, De Lamartine, Louis Blanc, Considérant, Cavaignac, &c. All three papers—*Le Peuple*

(November 23, 1843—April 1849), *La Voix du Peuple* (October 1849—May 1850), *Le Peuple de 1850* (June 15—October 13)—were in turn suppressed as anarchic and obnoxious. During their continuance, he was repeatedly subjected to fines, which were defrayed for him by popular subscription.

In January 1849, he attempted a reduction of his theories to practice by the institution of a *Banque du Peuple*. This project, which had for its object the suppression of capital, speedily experienced at the hands of 'capital' the fate it had intended to inflict. The bank was closed by authority, and its originator fled to Geneva, to escape threatened imprisonment. In June, however, he returned, and his next three years were passed in the prison of St Pelagie. While shut up there, he married. During his imprisonment, he gave to the world the works entitled *Confessions d'un Révolutionnaire* (1849), *Actes de la Révolution* (1849), *Gratuité du Crédit* (1850), and *La Révolution Sociale démontrée par le Coup d'Etat* (1852); the last of which is remarkable, in the light of subsequent events, for the clearness with which it states the alternative of *l'anarchie ou le Césarisme*, as pressed on Louis Napoleon, then president. In June 1852, he was set at liberty; and quitting Paris, no longer a desirable abode for such unquiet spirits, went to Belgium, where he continued to publish from time to time on his favourite subjects of speculation. He died in obscurity at Paris, January 19, 1865.

Monstrous as are the social theories with which, in the history of his time, the name of P. remains connected, his power as a writer is not to be denied. It may be questioned how far he was at any time the dupe of his own paradoxes, or blind to the utter insufficiency of the premises from which, with a show of scientific rigour, he evolved his portentous results. It is related that in the negotiation of his marriage, he was very sharply solicitous as to the disposal of certain property possessed by the lady; and that on her notary venturing some surprised allusion to the famous *La Propriété, c'est le Vol*, the philosopher gravely replied: 'Be pleased, my dear sir, on such an occasion as the present, to be, if possible, a little serious.'

PROUT, SAMUEL, painter in water-colours, was born at Plymouth in 1783. He evinced a strong love for nature at an early age. Mr Britton, when about to collect materials for his *Beauties of England and Wales*, engaged his professional aid; and his drawings made for Britton's work attracted so much notice in London, that he was induced to take up his residence in that city. In 1818, having been advised, on account of his health, which had always been delicate, to try a change of air, he went to Rouen by Havre; and the picturesque street-architecture and fine Gothic remains there made so strong an impression on his mind, that afterwards, his principal works were those in which architecture had a prominent place; and from time to time, in his after-career, he made excursions, ransacking every corner of France, Germany, the Netherlands, and Italy, for picturesque architectural remains. P.'s name is dear to all the artists and amateurs of this generation, for there are few who have not been incited or instructed by his numerous elementary drawing-books, in the slightest of which, talent and feeling for art are conspicuous. His water-colour drawings are characterised by decision in handling, great breadth, and clear and pleasing colouring; good specimens are highly valued. He died at Camberwell on February 9, 1852. His character was amiable, and he was highly respected by his professional brethren.

PROVENCE, formerly a maritime province of France, in the extreme south-east of the country, was bounded on the S. by the Mediterranean, and comprised the modern departments of Bouches du Rhone, Var, Basses-Alpes, and the east part of Vaucluse. It included a portion of the territory belonging to the Roman province of Gaul generally called simply *Provincia* ('the Province'), whence it derived its name.

PROVERBS (Lat. *proverbium*, a common saying or word, Gr. *paroimion*, a way-side saying, corresponding to Eng. byword) are pithy, practical, popular sayings, expressive of certain more or less general convictions. The definitions of the proverb are almost as numerous as its own varieties of form. Aristotle speaks of them as 'remnants, which, on account of their shortness and correctness, have been saved out of the wreck and ruins of ancient philosophy.' Agricola considers them 'short sentences, into which, as in rules, the ancients have compressed life.' Erasmus holds them to be 'well-known and well-used dicta, framed in a somewhat out-of-the-way form or fashion.' Cervantes explains them as 'short sentences drawn from long experience.' Johnson talks of them as 'short sentences frequently repeated by the people.' Less definitions of, than general opinions on the proverbs, are sayings like that of Howell, that 'sense, shortness, and salt' form their component parts. They are 'the genius, wit, and spirit of a nation,' according to Bacon. 'The wisdom of many, and the wit of one,' according to Earl Russell. In them, it has been said, is to be found an inexhaustible source of precious documents in regard to the interior history, the manners, the opinions, the beliefs, the customs of the people; and their use has been strikingly pointed out by George Herbert, who entitled his collection of proverbs *Jacula Prudentium* (Darts or Javelins of the Wise), a term probably derived from Plato's *Protagoras*.

Yet there have, on the other hand, not been wanting those who, like Lord Chesterfield, have deprecated their use in polite society, on account of their occasional vulgarity, and recommended stilted sentences à la Larochevoucauld instead. Of these solitary voices, however, no more notice was ever taken than they deserve. From the earliest historical times, proverbs have been household words, not merely among the people at large, but among the greatest and wisest of men. The prodigious amount of sound wisdom and good common sense they contain, the spirit of justice and kindness they breathe, their prudential rules for every stage and rank, their poetry, bold imagery and passion, their wit and satire, and a thousand other qualities, have, by universal consent, made them the most favourite mode of imparting hints, counsels, and warnings.

Being emphatically sayings originated within or commonly adopted by the people, and handed down, in most cases, from the remotest antiquity, the question as to their origin and age is an exceedingly difficult one. Some of their sources have been pointed out in the responses of oracles, in the allegorical symbols of Pythagoras, in the verses of the ancient poets, in mythological tales, in historical events to which they allude. That they existed to a great extent before the times of which written records have reached us, is clear from the number of them which lie imbedded—as a kind of well-known quotations—in these records themselves; and what tends still further to increase the difficulty of giving them a kind of fixed habitation within a certain country or age, is the circumstance that the same proverbs are found, as it were, among all nations and at all ages. From the East they

were for the most part imported into Hellas, thence to Rome, and from thence they were scattered all over Europe, and partly brought back again, slightly altered, to the East. Even certain Jewish proverbs quoted by Christ and the apostles, which hitherto did not seem to offer any analogy in other languages, might be traced back to India, where they had existed for many long centuries before they found their way into the popular speech of Palestine and Babylonia, and thence into the Talmud. That the names of their authors should, as a rule, be lost, is not surprising; yet we do meet with single instances in which either the author of a proverb is well known, or others whose nationality and birthplace are easily recognised. In the former case, it is generally some memorable event in a celebrated man's life which is remembered in close connection with a certain striking sentence he then uttered. In the latter, the scenery, the circumstances, the history of a special country, may so unmistakably be pointed, that they leave no room for any doubts on the birthplace of the special proverb; and more than that, even the special period which gave it birth, may be recognised by some trace of its character, manners, fashions, and occupations. 'What is nearest and dearest to the heart of a nation, the aspect under which they contemplate life, how honour and dishonour are distributed among them, what is of good or of evil report in their eyes,' as a recent writer has it, will surely be apparent in their national proverbs. Thus, for instance, the Greek proverbs may be designated as being fraught with a thorough knowledge of their own mythology, poetry, and history, bearing testimony to the high intellectual training that ran through all classes. The Roman ones—fewer in number, as far as they are the genuine growth of their own soil—have much less poetry about them, and are also deficient in the refinement and delicacy which were indigenous to Hellas. On the other hand, the character of the people comes well out in the constantly reiterated lessons of frugality, patience, perseverance, independence they inculcate; the practical hints as to marriage, education; and the various pursuits of that busy, vigorous, energetic nation—and among which agriculture played a prominent part. Of the proverbs now in use among European nations—calculated at about 20,000—the Spaniards are supposed to have a very large, if not the largest proportion. They may be recognised by a certain *grandezza*, a stateliness and thoughtfulness, blended though they be with humour and irony; and by the spirit of chivalry, honour, and freedom with which they are filled. The Italian proverbs, which come next as to quantity, are, to a certain extent, replete with a certain shrewdness and selfishness; and while they are fraught with unbridled passion, teach doctrines of cynicism and general distrust; yet, on the other hand, there are many of the noblest stamp, of a delicate refinement of beauty, of a subtle wisdom, teaching honour and honesty, plain-dealing and uprightness. In the same way, the French, the German, the English, as well as the Chinese and the Hindus, and every nation under the sun, impart a certain distinctive type and stamp to their homely sayings, which tells a distinct tale respecting their own inner life and national peculiarities. Of the Scotch proverbs, of which Kelly collected 3000, it has been said that there is a shrewdness, although deficient in delicacy, about them; that they are 'idiomatic, facetious, and strike home.'

Of the general utility of the proverb, it is needless to speak, after what we have said; we will only adduce the well-known frequent use made

of them for ethical purposes in Scripture, which contains an entire book of them, ascribed, for the greater part, to the Wise King himself; in the Midrash and Talmud, which contains, likewise, a whole collection of pithy sayings of the 'Fathers,' or Mishnan teachers, and out of which several later collections have been compiled; in the patristic and later theological writers, who, like Luther, drew very largely upon these popular treasures.

Erasmus lays claim to be the first modern collector of proverbs, although Polydore Vergil, and not without a certain amount of truth, accuses him of plagiarism. His *Adagia* (Par. 1500) fired the learned in Europe with a desire to collect and to publish proverbs of their own countries. F. Nunez and the Marquis of Santellana edited Spanish *Refranos*; Florio, an Italian, *Giardino di Riceratione* (1591); which was followed by the Italian collections of Angelus Monozini and Julius Varini. Ondin published French proverbs as *Curiosités Françaises*. The first real German (Nether-Saxon) collection is due to Johann Agricola, whose *Gemeine Sprikwoerdt* appeared in 1528. In England, Camden, Herbert, Howell, Fuller, Ray, Kelly, Bohn, and others; in Germany, Weber, Sailer, Nopitzsch, &c., have issued national collections. Freytag and Burkhardt published *Arabic Proverbs*; Dukes, a small collection of Neo-Hebrew proverbs, &c. Thus, it may easily be seen, there is by no means a lack of material; and yet very little has been done towards the investigation and elucidation of the numerous points of interest connected with this subject. Disraeli's *Curiosities of Literature* contain a valuable essay on the 'Philosophy of Proverbs,' from which (as also from Eiselein's *Sprichwörter und Sinnreden*, 1840) Archbishop Trench has derived a great deal of information for his excellent little book, *On the Lessons in Proverbs*. Freytag's introduction to his collection of *Arabic Proverbs*, and that of Le Roux de Lincy to his French collection, make honourable exceptions to the general run of vapid prefaces to most modern collections.

PROVERBS, THE BOOK OF (Heb. *Mishle*, LXX. *Paromia Salomontos*, Vulg. *Proverbia*), a canonical book of the Old Testament, containing an anthology of gnomes and sentences, the fruit of reflections on the Mosaic law and on the divine guidance of the people of the Israelites. It is also called the 'Book of Wisdom,' in as much as it embraces the doctrines of the old covenant crystallised into religious maxims of thought, will, and action. Practical piety is enjoined under the name of 'Life,' while 'Death' represents sin throughout. The form of these proverbs is manifold—similes, enigmas, theses and antitheses, wise sayings, gnomes, comparisons, &c., vary constantly. The book is divided into three sections, to which the two last chapters form an appendix. The first section (chaps. i.—ix.) contains a description and a recommendation of Wisdom as the highest good obtainable, and is further subdivided into three portions. The second (x.—xxiv. 34) is equally in three portions, in the first of which the sentences are very loosely strung together; while, in the second, they are joined into more continuous utterances, sometimes running through several verses; and the third, which has the inscription: 'These, too, are of the wise men,' contains, again, some single sentences, principally in the form of commandments and prohibitions. The third section (xxv.—xxix.) is inscribed: 'These are also proverbs of Solomon, which the men of Hezekiah king of Judah copied out,' and is somewhat different from the former by the more predominant form of theses and antitheses, catch-words by which an association of ideas is produced, and similes. The

first chapter appended (xxx.) contains the proverbs of Agur, which, in a very artificial garb, teach the true wisdom and its practice in life; the second (xxxi.), inscribed: 'Words of King Lemuel, the prophecy that his mother taught him,' contains from verses 1—9 wise maxims for a king anent chastity and temperance, and from 10—31, the praise and properties of a good wife, in the form of an alphabetical song. Tradition has ascribed the authorship of this book to Solomon, 'the wisest of men;' but although neither the language, nor the structure, nor—as has principally been urged—the contents, are of a nature to convince us of the absolute necessity of assuming various authors and various epochs, there is no doubt a strong presumption in favour of this hypothesis. Who the Agur was that is mentioned as the author of the last chapter but one, is not easily conjectured. Equally unsatisfactory are the results of the speculations about the reputed author of the last chapter, Lemuel, by some supposed to be the brother of Agur. Probably it is nothing more than a symbolical name. The last section (xxxi. 10—31)—an alphabetical acrostic—probably belongs to the 7th c. B. C., and by its language and form, does not appear to belong to the author of the preceding part of the chapter. The nucleus of the book is formed by the second section (x.—xxii. 16), to which the first (i.—ix.) was added by way of introduction, and the third as the concluding portion. Whether that first anthology (from the 3000 proverbs of Solomon mentioned 1 Kings, iv. 32) was collected and redacted (into section two) during Solomon's lifetime, is very doubtful; so much, however, is certain, that the learned men at the time of Hezekiah undertook their additional collection with a view to a then already-existing portion. It may not be superfluous to add, that Jerome, misled by 1 Kings, iv. 32, erroneously states our Book of Proverbs to contain the 3000 proverbs there ascribed to Solomon. The canonicity of the book is matter of controversy in the Talmud; there seems to have been at one time an objection to receive it among the number of sacred books, on account of certain contradictions contained in it; this objection, however, was overruled, and it occurs in the order of the Hagiographa (Kethubim) of the Masoretic Code, generally between Job and Ecclesiastes. The order followed in the Authorised Version had been adopted already in the time of Jerome.—Principal writers on P. are Ewald, Bertheau, Hitzig, Elster, Rosenmüller, Hirzel, Umbreit, M. Stuart, and Dr Noyes.

PROVIDENCE, a city, semi-capital, and seaport of the state of Rhode Island, U.S., situated at the head of navigation, on an arm of Narraganset Bay, at the mouth of Providence River, 35 miles from the ocean, 43 miles south-south-west from Boston, and 173 east of New York. It is the second city in New England, covering nine square miles on both sides of the river, which, above its two bridges, expands into a cove, a mile in circuit, on the borders of which is a handsome park, shaded with elms. It is a city of large commerce, manufactures, and wealth, abounding with beautiful villas and gardens. Two small rivers afford water-power to extensive manufacturing establishments. There are 4 daily and 6 weekly papers, the oldest of which was established in 1762; 80 churches, among them the oldest Baptist church in America, established in 1638 by Roger Williams, when banished from Massachusetts; hospitals and asylums; a state prison, which by the employment of its convicts is more than self-sustaining; a county jail, and a reform school. Among its other institutions are: Brown University; an Athenæum, with a library of 34,000 volumes; a liberally-endowed col-

lege of the Society of Friends; a Roman Catholic Institute; Historical Society; 4 grades of free schools; 37 banks; 9 savings banks; 20 insurance companies; several railways, uniting in one central station; several lines of steamboats; many cotton and woollen factories; numerous iron works; 7 bleaching and calendering mills; 3 screw-factories, making 5000 tons a year; and about 150 manufactories of gold and silver ware and jewellery. P. was settled in 1636, by a colony of refugees from Massachusetts, under Roger Williams. Pop. in 1870, 68,904; in 1880, 104,857.

PROVINCIAL OF AN ORDER is the superior of all the houses, and all the members of a monastic order, within any particular province. The office is generally held for a stated term of years, and in most orders, the appointment to it rests with the General (q. v.).

PROVINS, an old town of France, in the department of Seine-et-Marne, 59 miles east-south-east of Paris, occupies a valley irrigated by two streams, the Darten and the Voulzie, whose waters are employed to turn 50 or 60 corn-mills in the district. It is surrounded by ancient walls, flanked by ruined watch-towers, and is divided into the high and low towns. In the former, is an ancient tower built during the middle ages, but vulgarly called the *Tour de César*. The vicinity was long famous for its roses, which are still cultivated to a considerable extent.

PROVISION (Lat. *provisio*, from *providere*, to provide), in Church Law, means the bestowing an ecclesiastical benefice, and involves two stages—the designation of the person on whom it is bestowed, and the actual collation (Lat. *collatio*) of the benefice, which is completed by his taking possession. Both these acts fall properly to the ecclesiastical authority; but by usage of a very early date, the state, and often individuals, are admitted to a share in the provision of ecclesiastical benefices. In the mediæval church, the claim of the sovereign to the provision of vacant bishoprics, was often the subject of contention with the popes (see INVESTITURE), but at all times the right of final and complete provision was admitted to belong to the pope. In later times, this claim has commonly been regulated by concordat. In most Roman Catholic countries, the crown elects to bishoprics, and the pope is bound to confirm the nominee of the crown, unless canonical cause of rejection should appear. In the Russo-Greek Church, the candidates are presented by the Holy Synod, and the czar names the bishop from among them. In Protestant countries, the election to benefices and dignities in the Roman Catholic Church is generally by the chapters; but in some of them, as in Holland and Prussia, a qualified veto is permitted to the crown. In the Church of England, the bishop is nominally elected by the chapter; but, in reality, the members of the chapter are only permitted to name the particular person whom the crown presents to them for election with the *consent d'élire*. In the Roman Catholic Church of England and of Ireland, the parochial clergy, together with the canons, recommend three candidates, one of whom is commonly, although not necessarily, appointed by the pope. (See INSTITUTION.) The completing act of provision is the installing in possession, which is described under the head INDUCTION (q. v.).

PROVISIONAL ORDER. See SUPPLEMENT in Vol. X.

PROVISORS, STATUTE OF. The object of this statute, 25 Edward III. st. 6, was to correct, and put an end to, the abuses which had arisen in the exercise of the papal prerogatives as to the disposal of benefices in England. See BISHOP; PATRONAGE.

PROVOST (Lat. *propositus*, set over), in Church Law, the chief dignitary of a cathedral or collegiate church, from which use the title has also been transferred to the heads of other similar bodies, whether religious, literary, or administrative. Properly, however, the name is given to the highest dignitary in the metropolitan or diocesan chapter, and is often held conjointly with the archdeaconry. The provost is the next in dignity after the archbishop or bishop, a position which is also the right of the provost of a collegiate chapter. The name is also given to the superiors of certain religious houses of lesser rank, and the relation of which to the more important houses is analogous to that of the priory to the abbey. It was also given to certain lay officials, whose duties, in relation to the church and the maintenance of its material condition, were similar to those of the modern churchwarden. In the Protestant Church in Germany, the name provost is sometimes used as synonymous with that of dean or arch-priest; and occasionally, where several minor churches or chapels are attached to one chief church, the minister of the latter is called 'provost.'

In England, the heads of several colleges in the university of Oxford, and the head of King's College, Cambridge, are designed provost. The head of Eton College is also so called. The Provost of the Mint is a judge appointed to apprehend and prosecute false coiners.

In Scotland, the chief municipal magistrate of a city or burgh is called Provost, the term corresponding to the English word mayor. The provost presides in the civic courts along with the bailies, who are his deputies. The chief magistrates of Edinburgh and Glasgow are styled Lord Provost, and the same designation has long been popularly given to the Provost of Aberdeen, and his right to it, which has been contested by the Court of Session, seems lately to have acquired some sanction from royal usage. It has been said that the Provost of Perth, from having been on one occasion addressed by Queen Victoria as Lord Provost, is entitled to the same style. The Lord Provost of Edinburgh is entitled to the prefix 'Right Honourable,' which may be attached not merely to the name of his office, but to his Christian name and surname, a usage which probably originated in the circumstance, that the Lord Provost of Edinburgh was *ex officio* a member of the old Scots Privy Council. Within the city and liberties of Edinburgh, the Lord Provost takes precedence next after members of the royal family. The Lord Provost of Glasgow is generally styled the 'Honourable,' a prefix, however, which belongs only to his office, and cannot be attached to his name.

In France, there were formerly various descriptions of inferior judges, known under the name of provost (*prévôt*). The Grand Provost of France had jurisdiction in the king's house and over its officers.

PROVOST-MARSHAL, in the *Navy*, is a person appointed to have charge of a prisoner before a court-martial, and until the sentence of the court is carried into execution. In the *Army*, the provost-marshal is an officer, with the rank of captain, appointed to superintend the preservation of order, and to be, as it were, the head of the police of any particular camp or district. He has cognizance of all camp-followers, as well as of members of the army. His power is summary, and he can punish an offender, taken *flagrante delicto*, on the spot, according to the penalties laid down in the Mutiny Act.

PROW (from the Latin *prora*) means, generally,

the fore-part of a ship, or more especially the beak or pointed cut-water of a galley, polacre, or xebec.

PROXY (contracted for Procuracy), the agency of one person who acts as substitute for another. Every member of the House of Lords can (by licence, in theory supposed to be obtained from the sovereign) appoint another Lord of Parliament his proxy to vote for him in his absence. A spiritual lord can, however, only be proxy for a spiritual lord, and a temporal for a temporal lord, and no peer can hold more than two proxies at the same time. Proxies cannot be used in judicial cases, or where the House is in committee, nor can a proxy sign a protest.

PRUDENTIUS, AURELIUS CLEMENS, a Christian poet of the 4th c., was a native of Spain, and was born 348 A.D. Nothing is known regarding him except what he has himself told in a poetical autobiography prefixed to his works. From this we learn that he received a liberal education, was admitted to the Roman bar, practised as a pleader, discharged the functions of civil and criminal judge, and was ultimately appointed to a high office at the imperial court. The year of his death is not known. In his youth, P. was fond of pleasure, and very dissipated; but as he grew old, he became very devout, and his writings (which are all in Latin verse) reflect the latter phase of his character. The principal are—1. *Cathemerinon Liber* (Book [i.e., of hymns] for Daily Use), being a series of twelve hymns, the first half of which were reckoned by the author suitable for devotional purposes at different parts of the day; 2. *Apotheosis* (a defence of the doctrine of the Trinity against heretics); 3. *Hamartigenia* (On the Origin of Evil, a polemic, in verse, against the Marcionites); 4. *Psychomachia* (The Triumph of the Christian Graces in the Soul of a Believer); 5. *Contra Symmachum, Liber 1* (a polemic against the heathen gods); 6. *Contra Symmachum, Liber 2* (a polemic against a petition of Symmachus for the restoration of the altar and statue of Victory cast down by Gratian); 7. *Peri Stephanon Liber* (14 poems in praise of Spanish and other martyrs for the faith); 8. *Diptychon* (48 poems of four verses each, on Scriptural incidents and personages). Bentley calls P. 'the Horace and Virgil of the Christians,' which may be true enough if the critic only meant to say that P. is the first of the early Christian verse-makers; but is ridiculous if he intended to hint at a comparison with these masters of poetic elegance and grace.

PRUD'HOMMES, COUNCIL OF (from Latin *homo prudens*), municipal tribunals, which existed first in the middle ages at Marseille, Lyon, and perhaps elsewhere in France, exercising an equitable jurisdiction as arbiters of disputes between masters and workmen. Similar tribunals, under the same name, were reintroduced by Napoleon I. in 1806, and have been found of great practical utility. They now exist in two localities in France, Lyon and Paris. They were instituted in the former town in 1806, in favour of the silk-trade and other trades immediately connected with it. The council consists of manufacturers, mercers, master-workmen, foremen, dyers, and common workmen, elected among themselves. The council is empowered to dispose finally of all differences between manufacturers and their workmen, or between master-workmen, companions, and apprentices, where the sum in dispute does not exceed 200 francs; and it may also take cognizance, subject to an appeal to the Tribunal of Commerce or Tribunal of First Instance, of similar disputes, whatever their amount. Other functions of a miscellaneous nature belong to the Council of Prud'homes, including the inspection of the workshops, in order to obtain

information regarding the number of looms and of workmen, and the giving an opinion, when required by the administrative authorities, on any question submitted to it. In 1844, a Council of Prud'hommes was established in Paris in favour of the metal trade, and all trades connected with it; and three new councils of the same kind were instituted in Paris in 1847—one connected with the manufacture of tissues of all kinds, another with the manufacture of chemicals, and a third having jurisdiction in all other trades.

PRUNELLA, a genus of plants of the natural order *Labiata*, having the upper lip of the calyx 3-toothed, the lower lip bifid; the upper lip of the corolla arched and nearly entire; the lower lip 3-lobed; and four filaments, each with two teeth at the extremity, of which one bears the anther. Several species are natives of Europe; one only is found in Britain, *P. vulgaris*, popularly known as **SELF-HEAL**, a plant very frequent in moist and barren pastures, as it is also throughout most parts of Europe, Central Asia, North America, and New Holland. It has oblong-ovate stalked leaves, and violet-blue flowers, very densely whorled, so as to form an imbricated oblong spike. It was at one time in considerable repute as a febrifuge. It is mildly aromatic and slightly astringent.

PRUNES are dried fruit of the plum-tree (*Prunus domestica*), of the variety called *Jubiana*, which is so largely cultivated in France, that not only is that country supplied, but Britain also imports from thence over 400 tons per annum. They are much used in the manufacturing districts of England by the operatives, who make puddings and pies of them when fresh fruit is out of season. The very fine kind which are sold in highly ornamental boxes are called French Plums or Table P.; these are a much finer variety, viz., *Catherinea*, which are much larger, and, when ripe, are much sweeter. They are more carefully prepared, being gathered by hand, and separately dried. They are used chiefly as a dessert fruit. In 1870 the amount of prunes and plums imported for consumption in the U. States was upwards of 4000 tons, valued at \$439,086.

PRUNING, the removal of branches from fruit or forest trees, in order to the greater production of fruit, the improvement of the timber, or purposes of ornament. In pruning for ornamental purposes, taste must chiefly be consulted, but reference must be made to what has been too little regarded in pruning of every kind—the nature or habit of the tree itself. Some trees will bear clipping into fantastic forms, which would be utterly destructive of others. Such forms, once esteemed as the finest ornaments of a pleasure-ground, or the neighbourhood of a mansion, are rejected by the simpler taste of the present age, and the *topiarian art* has few admirers. Much may be done, however, by the removal of branches, to give a finer form to ornamental trees; but in this, as in the pruning of trees grown for the sake of their timber, a great mistake is very generally committed in permitting branches to grow to a considerable size before they are cut off. It may be accepted as a general rule, that the branches removed should be small in proportion to the whole bulk of the tree. The removal of twigs and small branches is attended by no bad effects, and may be beneficial; but the removal of large branches is dangerous. The leaving of stumps or snags is an aggravation of the evil. They rot away, and spoil the timber of the stem; indeed, a hole is not unfrequently formed. But as to forest trees, pruning may with great advantage be in great part avoided, by taking care to plant at proper distances, and thinning out the plantations sufficiently in early

periods of their growth. In this way, better timber is obtained, and a greater produce from the land. Pines and firs scarcely ever require pruning, and are probably in almost all cases the worse of that which they get, except in the removal of those lower branches which have actually begun to decay. In other trees, it is sometimes of importance to watch for branches that would divide the trunk, and to prevent the division, causing the main stem to ascend higher before it forms a crown; but to be of any use, this must be done whilst the branches are still very young. Plantations should therefore be examined with a view to pruning, at intervals of not more than two years, after they are six or eight years old.

In orchards and fruit-gardens, pruning is necessary, the object being not to produce timber, or the utmost luxuriance of trees, but fruit in the greatest perfection and abundance. The habits of each kind must be studied. Even in the pruning of gooseberry and currant bushes, regard must be had to natural diversities, the gooseberry and black-currant producing fruit chiefly on young wood, whilst the red and white-currant produce fruit chiefly on spurs from older branches. And so it is amongst trees; apricots, for example, producing fruit chiefly on young wood; cherries mostly on spurs, whilst plums produce both in the one way and in the other. The object of the gardener in pruning is to bring the tree into the condition best suited for producing fine fruit and in the greatest abundance; and to this the training of Wall Trees (q. v.) must also be accommodated. Sometimes, in order to produce particularly fine fruits for the improvement of the variety by seed, or for the sake of a prize at a horticultural exhibition, the gardener diminishes the number of branches likely to bear fruit, beyond what would otherwise be desirable.

The general seasons of pruning are winter and spring; but some trees, particularly cherries, are advantageously pruned in summer, as they then throw out less gum.

Pruning instruments are of various kinds—knives, axes, saws, bills of very various forms, &c., and the *avunculator*, which may be described as a pair of scissors, one blade hooked or crooked, attached to a long handle, and working by a cord and pulley. It is scarcely used except for standard trees in gardens and orchards.

PRUNUS. See **PLUM.**

PRURIGO is a non-contagious affection of the skin, in which intense itching is the most prominent symptom. Sometimes the parts affected present no marked deviation from the normal type, but most commonly they are covered with papule, which are nearly of the same colour as the skin. Hence P. has been placed among the papular diseases of the skin. William makes three varieties of this disorder—viz., *P. mitis*, *P. formicans*, and *P. senilis*. This affection seldom affects the whole surface; its favourite seats being the neck, the shoulders, the back, the outer surface of the limbs, the anus, &c. In *P. formicans* there is not only intense itching, but patients complain of a feeling like the creeping of ants (hence the specific name) or the stinging of insects, or as if hot needles were thrust into the skin. All the forms of this disease are aggravated by exposure to the air, and by heat, and the sensations are often so distressing after the patient has become warm in bed, as to prevent sleep for many hours. *P. senilis*, occurring, as its name implies, in old persons, is characterised by the extreme severity and permanence of the itching, and by the obstinacy with which it resists every kind of treatment. The different varieties of this disorder may probably b

PRUSSIA.

often traced either to diseases of the digestive system, or to want of personal cleanliness; but in most cases their origin is obscure.

In the treatment of this disease, attention should be paid to the diet. All stimulating condiments and drinks should be forbidden, and only a plain, easily digested food allowed. Internal remedies are seldom of use, excepting opium, which in severe cases is required in free or large doses, in order to procure rest. The local applications that have been recommended are very numerous. Lotions of spirit, diluted vinegar, solution of acetate of ammonia, glycerin, prussic acid, &c., and ointments containing creasote, iodide of sulphur, aconitin, &c., have been advocated by various physicians of eminence. Unless, however, the greatest attention is paid to personal cleanliness, no remedy is likely to be of permanent benefit.

PRUSSIA (Ger. *Preussen*) is a kingdom of the new German empire, formerly consisting of two large tracts of land extending from Russia on the east to Holland and Belgium on the west, south of the Baltic and north of Saxony, Thuringia, Bavaria, &c., but separated from each other by the K. of Hanover, the D. of Mecklenburg and Oldenburg, the Electorate of Hesse-Cassel, D. of Nassau, and some minor states.

In 1866 P. received large accessions of territory, having annexed the Kingdom of Hanover, Duchies of Hesse-Cassel, Nassau, and Slesvig and Holstein, the free city of Frankfort, and some districts of Bavaria and Hesse-Darmstadt. The area of P. was thus increased from 108,212 Eng. sq. miles to 134,292, and the population from 19,304,843 to 24,106,847, of whom 23,746,790 formed the civil population, and 310,055 the military; the average density of the population being 176 per English square mile. The variation in density is considerable, the greatest being in the manufacturing district of Düsseldorf, in the Rhine Province, where it is four times the average; and smallest in the district of Köslin, Pomerania, where it amounts to three-fifths of the average. P. is now divided into 13 provinces, with a pop. as follows, according to the census of 1880:

Provinces.	Square miles.	Pop. (1880).
East Prussia,	14,220	1,933,936
West Prussia,	9,892	1,405,898
Posen,	11,178	1,708,397
Pomerania,	11,629	1,540,034
Silesia,	15,355	4,007,925
Brandenburg,	15,403	3,389,155
Saxony,	9,748	2,312,007
Sleswick-Holstein,	7,218	1,127,149
Hanover,	14,856	2,120,168
Westphalia,	7,800	2,043,442
Hesse-Nassau,	6,137	1,554,376
Rhenish Prussia,	10,415	4,074,000
Hohenzollern,	441	67,624
Total,	134,292	27,279,111

Physical Character, &c.—The eastern and larger portion of P. is a part of the great table-land of Eastern Europe, and, except in the south, on the Bohemian boundary, is an almost unbroken plain, only 600 or 700 feet above the level of the sea. The Sudetic Mountains, whose northern ranges, known as the Riesengebirge (q. v.), lie between the Oder and the Elbe, divide P. from Bohemia; while the Thüringerwald intersect the line dividing it from Saxony, and the Harz Mountains (q. v.) border on and extend into Hanover. None of these ranges rise, even in their highest summits, above 5000 feet. The surface of the great plain of Eastern P. is marked by two distinct tracts of more elevated land, one of which belongs to the elevation which, running generally parallel to the Baltic, may be traced from the mouth of the Elbe to the source of the Volga, and which in P. rises about 400 feet above the sea-level. This tract is diversified with numerous lakes, none of which is more than 20 square miles in extent, but which altogether occupy an area of more than 300 square miles. The

soil, consisting chiefly of loose sand interspersed with a large number of erratic blocks of granite, is sterile, covered in many places with heaths and belts of stunted pines. On the northern slope, terminating on the shores of the Baltic, there are several fertile districts, more especially along those rivers which have been carefully embanked, as the Niemen and the Vistula. The southern elevation of the Prussian plain, running between the Polish mountains of Sandomir in the south-east, and the Elbe between Magdeburg and Burg in the north-west, attains a height of about 1000 feet near Breslau on the Oder, where it is known as the Trebnitz Heights. Its general character is more fertile than the northern elevation; while the country between the two is, for the most part, extremely sterile. It includes the sandy waste in which Berlin, the capital, is situated. South of this tract, and in Silesia and Prussian Saxony, the country is fertile, including some of the most productive grain-growing districts of Prussia. Eastern P. has four large rivers—the Elbe, Oder, Vistula, and Niemen; the numerous affluents of which, running east and west, together with many smaller streams, between the two elevated tracts of the plain, contribute largely to the facilities of intercourse throughout the country, as many of them are navigable for vessels of several hundred tons.

Western P., which includes the Rhenish districts and Westphalia, is divided by the Rhine into two portions, each of which has an elevated and a low plain. On the west bank of the river, the level land terminates in the northern extremity of the Vosges, or, as they are here called, the Hardt Mountains, and extends northward as far as Aix-la-Chapelle. This table-land is broken along the banks of the Moselle by ranges of the Hochwald and the Soonwald, the highest summit of which, Walderbsenkopf, attains an elevation of about 2700 feet. The plain north of the Moselle, which is known as the Eifel and the Hohe Veen, has a mean elevation of 1600 feet, with a few higher hills. The level country between the Rhine and Maas, bordering the Eifel, is extremely fertile. On the east side of the Rhine, the table-land, rising along the banks of that river and the Main, terminates in the ridge of the Taunus, whose highest summit, the Feldberg, attains a height of more than 2800 feet, or about 800 feet more than the mean elevation. In the north, the plain ends in the Westerwald, and in the Sauerland. These districts possess special sources of wealth in their iron and coal mines. The physical character, &c. of the newly-acquired provinces may be seen under HANOVER, SLESVIG-HOLSTEIN, HESSE-CASSEL, NASSAU, &c.

The narrow valley of the Rhine is noted as one of the most picturesque and beautiful parts of Germany. The Rhine (q. v.) is navigable throughout its entire course in P., which it traverses from south to north, receiving numerous other rivers—as the Lahn, Wied, Sieg, Wupper, Ruhr, Lippe, Berkel, and Vechte on the right; and on the left, the Ahr and the Moselle, the latter of which is navigable for more than 150 miles within the Prussian dominions. The rivers of P. are connected by numerous canals, the principal of which are the Neuer or Seckenburger, the Frieslandgraben, the Finow, Bromberger, and Friedrich Wilhelms, which unite the important districts of the Oder with the Vistula; the Spree and the Havel; and the Planesche, which connects the latter river with the Elbe, and those formerly belonging to Denmark (q. v.).

Climate, Products, &c.—The climate of P. presents great differences in the eastern and western provinces—the former being exposed to heavy snow storms in the winter, and great drought in the summer, and with a mean annual temperature of 43°

has a summer mean temperature of 61°, and winter, 26° F.; while the latter, which have milder winters, and a larger fall of rain, have a mean annual temperature of 49°·5—summer, 63°, and winter, 35° F.

Agriculture and the rearing of cattle constitute the principal sources of employment and wealth of the rural population of the entire monarchy, and the state has hitherto directed its unremitting attention to the furtherance of the one, and the improvement of the other; abrogating onerous land-taxes, advancing money to landowners, encouraging agricultural institutions, introducing approved breeds of animals, and improved farm instruments, &c. Wheat, rye, oats, barley, peas, millet, rape-seed, maize, linseed, tobacco, flax, hemp, hops, and chicory are extensively cultivated, and largely exported. The finest grain districts are the Börde, near Magdeburg, the low lands on the Wartha and Netze, and on the Plöne and Madde Lakes, the north-eastern parts of Pomerania, the island of Rügen, the valleys of the Oder, the Elbe, and Weser, the Saale, Moselle, and Saar. Potatoes have of late years been largely grown. Western P. is noted for its excellent fruits and vegetables, and the Rhenish provinces stand pre-eminent for their wines, yielding on an average an annual quantity of about 26,700 gallons. The forest-lands, which are chiefly in East P., Posen, Upper Silesia, Westphalia, and Hanover, are of great value, and occupy an area of more than 10,000,000 English acres. The mineral products of P. include coal, iron, lead, zinc, copper, cobalt, antimony, manganese, arsenic, sulphur, alum, nickel, black lead, baryta, gypsum, slate, lime, freestone, salt, amber, agate, jasper, onyx, &c. All metals, salt, precious stones, and amber belong to the crown. The latter substance is found almost exclusively along the 12 or 14 miles of sea-coast on the Baltic between Pillau and Dirschkemen, where it is dug up, or dredged up close off the shore. P. has upwards of 100 mineral springs, of which the most noted and efficient are the sulphur baths of Aix-la-Chapelle, the iron springs of Driburg, and the hot and saline baths of Reineck, Lanjeck, Flinsberg, Freienwalde, and Lauchstadt.

The statistical tables of P., for 1869, give the following leading production of mines, salines, and metallurgic establishments: coal, 23,600,000 tons, valued at \$32,250,000; brown coal (peat), 6,000,000 tons, valued at \$4,000,000; iron, steel, and their products, valued at \$33,250,000; zinc, \$9,000,000; lead, \$4,320,000; copper, \$3,280,000; salt, &c., \$1,380,000; 3252 mines gave employment to 194,112 workmen; 38 salt-works to 2346, and 1545 metallurgic establishments employed 105,150 operatives. The total value of the mines was \$48,700,000; of the metallurgic establishments, \$106,500,000; making a grand aggregate of \$155,200,000. East P. is noted for its royal studs, and the excellent breed of horses which it now raises. Westphalia is noted for the excellence of its hams and pork, Pomerania for its smoked geese, and Brandenburg for its honey and wax.

Fish are abundant in the rivers and numerous lakes, and seals are taken in the Baltic. The wooded districts abound in game; pheasants, partridges, and wild geese being often found.

Manufactures, Commerce.—The principal manufactures are linens, for which certain districts of Silesia, Prussian Saxony, and Brandenburg enjoy a European celebrity, while of late years the cotton manufactories, worked by steam, in which there are about 3300 engines in operation in the Rhenish provinces, and as many more in the other parts of the state, have maintained a successful rivalry with the older linens, worked by hand-looms, of which there were 264,135 in operation in 1863. Besides these, there are numerous manufactories of silk, wool, mixed cotton and linen fabrics; including fine shawls and carpets in Brandenburg, stockings and ribbons in the Rhenish

provinces, where, as well as in Westphalia, the flax, hemp, and silk and cotton thread is mainly prepared for the manufacturers. These districts, moreover, stand foremost in regard to the preparation and manufacture of iron, steel (the steel- and gun-works of Krupp, at Essen, being the largest in the world), and other metallic wares, paper, leather, soap, oil, cigars, and tobacco, and for the number of their distilleries and breweries; while Saxony and Silesia have the largest number of chicory, starch, beet-root, gunpowder, and glass works. Berlin and Elberfeld rank among the most important centres of manufacture on the continent.

The commerce of P. is materially facilitated by her central European position, and the network of river and canal navigation (measuring in all about 4000 miles), which makes her territories the connecting medium between several of the great European states, and which, with 6177 miles of railway, 17,000 miles of public roads, and a sea-line of nearly 700 miles on the Baltic, and more than 200 miles on the North Sea, with the territory of Jade and naval port of Keppens, on the bay of Jade, give her a free outlet to the rest of the world. The Prussian mercantile marine numbered, in 1869, 1427 vessels, measuring more than 30 tons, with a total of 420,000 tons; on Jan. 1, 1870, it numbered 3272 vessels, of 642,805 tons, surpassing the combined merchant marine of Russia and the Netherlands. The principal ports are Memel, Pillau, Königsberg, Danzig, Colberg, Swinemünde, Stettin, Wolgast, Stralsund, Kiel, Flensburg, Altona, Harburg, Geestemünde, Leer, and Emden. The principal commercial towns are Berlin, Königsberg, Breslau, Barmen, Elberfeld, Danzig, Stettin, Cologne, Magdeburg, Aix-la-Chapelle, or Aachen, Frankfurt-on-the-Main, and Hanover; at several of these annual fairs are still held. The commerce of P. constitutes a very important branch of the great Zollverein, to the organisation of which the Prussian government gave the first impulse in 1819; and owing to the intricate and complicated nature of the trade relations of the country with the other members of that union, we must refer to the article Zollverein for the statistical tables of the value of Prussian imports and exports, which include, under the head of the former, raw and crystallised sugars, coffee, tea, spices, wines, spirits, tobacco, cotton, raw silk, hops, colouring matters, tin, quicksilver, salt-petre, glass, cattle, fish, petroleum, furs, &c.; and under the latter, wool and woollen goods, thread, yarn, flax, rape and linseed, silk and cotton and linen fabrics, wines, wood, salt, amber, coal, iron, lead, zinc, metal wares, dye-stuffs, books, leather, corn and bread-stuffs, &c.

Of the 1497 cities of P., seven only had, in 1880, a population exceeding 100,000—viz., Berlin, with a population of 1,122,360; Breslau, with 272,390; Cologne, 144,751; Königsberg, 140,909; Frankfurt-on-the-Main, 137,600; Hanover, 122,860; and Dantzig, 108,549. Of those whose population is less than 100,000, the following are the largest: Magdeburg, 97,529; Stettin, 91,745; and Barmen, 95,861.

The money, measures, and weights of P. are those in use throughout the German Zollverein, whose central bureau is located at Berlin. Accounts are kept in Thalers (q. v.) and silbergroschen. The Bank of Berlin, founded in 1765 with a capital of 19 million thalers, and 111 branches in the provinces, has the right of issuing notes of a fixed value, according to the demand required.

Religion, &c.—The dominant religion is Protestantism, and since 1817, the Lutheran and Reformed Churches have been united under the head of one common evangelical church. All matters connected with the external administration of the church are under the control of the minister of the theological

and medical departments, but every religious community manages its own internal concerns; the Protestant churches acting in conjunction with a consistory, one of which exists in each province, under the direction of the upper president, or provincial governor, and a clerical superintendent-general, who in Posen and Pomerania bears the title of bishop; while the Roman Catholic Church is directed by the two archbishops of Posen and Gnesen, and Cologne, under whom stand the four bishoprics of Culm, Münster, Paderborn, and Treves. The two episcopal sees of Breslau and Ermeland are directly under the jurisdiction of the pope, while the district of Glatz, in Silesia, belongs to the archbishopric of Prague, and Katscher, in Upper Silesia, to that of Olmutz. According to the census of 1867 there were 15,614,890 belonging to the Evangelical or State Church (Lutheran), 7,950,679 to the Roman Catholic, 313,156 Jews, and the remainder, about 86,000, to various Protestant sects. In 1864 the Protestants had rather more than 9000 licensed places of worship, with 6500 ordained clergymen; and the Roman Catholic Church nearly 8000 churches and chapels, with upwards of 6000 priests. In 1867 there were 24,382 churches of all denominations, and 224 monastic or conventual establishments, with 5613 inmates, mostly devoted to purposes of education, or nursing the sick. For distribution of religion, &c., in the states recently annexed to P., see HANOVER, SLESVIG-HOLSTEIN, &c.

Education.—Education is compulsory in P., and its management and direction under the control of the state. In no country are better or ampler means supplied for the diffusion of knowledge among all classes of the community. P. has 9 universities—viz., Königsberg, Berlin, Greifswald, Breslau, Halle, Bonn, Kiel, Göttingen, and Marburg, with 5673 students, and 2 Catholic colleges at Brauneberg and Münster. At the close of 1867 there were in P. 33,942 schools and educational establishments of every kind, exclusive of the universities; and of these 153 were colleges or gymnasia, about 1000 classical private schools, 58 normal, about 700 art, trade, and industrial schools, and about 25,000 public elementary schools, with 35,000 teachers, and about 3,000,000 scholars. The management of the elementary national schools is in the hands of the local communities; but the state appoints the teachers, and in part pays their salaries, the remainder being supplied by the public. In addition to the libraries of the several universities, there is the Royal Library at Berlin, with 500,000 volumes, and about 10,000 MSS. Among the numerous scientific, artistic, and literary schools and societies of P., the following are some of the more distinguished; the Academy of Arts, founded in 1699; the Royal Museum of Arts; the Academy of Sciences; the Natural History, Geographical, and Polytechnic Societies of Berlin; the Antiquarian Society of Stettin; the Breslau Natural History and Historical Societies, &c.

Charities.—P. has a large number of benevolent institutions, towards the maintenance of which the state gives annually about £16,000 sterling. In 1861 there were about 1000 public civil and military infirmaries, in which upwards of 170,000 patients were under treatment, and between 7000 and 8000 poor and almshouses; while 800,000 poor received support through these institutions or by extraneous relief. P. is supplied with asylums for the deaf and dumb, the blind and the maimed, and has good schools for training midwives, nurses, &c.

Justice.—The highest court of law is the Upper Tribunal in Berlin, and each province has its special court of appeal. Besides these, there are 125 magisterial, 7 commercial, and numerous military courts. In the Cologne district, the *Code Napoléon* is in force, and in Hither-Pomerania, the common German law; but in other parts of Prussia proper the Prussian code, com-

piled under Frederick the Great's direction, and introduced in 1794, is followed. A new penal code was promulgated in 1850, by which all pre-existing seigniorial, municipal, or ecclesiastical rights of decreeing punishments were unconditionally abrogated. Members of the royal family are amenable to special laws and courts. Lesser courts for the settlement of minor debts and disputes, and juries, have been introduced in every province of late years, and publicity is demanded by the constitution in the conduct of criminal cases. The administration of military matters is under the control of the minister of war; military courts are presided over by two civil and three military officers, and are subordinate to the local provincial courts of appeal.

Army, Navy, &c.—The army numbered in July 1872, 312,628 men (52,786 cavalry), and can be raised to 700,000 in time of war. The army consists of the regular troops and the landwehr, and in time of war an extra contingent can be called up under the title of the landsturm. Every able-bodied male Prussian is liable to be called upon to serve between 20 and 36 years of age. Mennonites (see ANABAPTISTS), clergymen of the Roman Catholic and Evangelical churches, and indispensable supporters of families are exempt. The time of active service is three years for some branches of the service, and two for the others. In peace the army is distributed over 309 garrison towns, 29 fortresses, of which latter 5 are in fortified places of the first rank, namely, Cassel, Königsberg, Mayence, Coblenz, with the opposite rocky heights of Ehrenbreitstein. In the campaign of 1866 it required less than two weeks to bring the whole regular army and first levy of landwehr into the field. Great care is bestowed on the education and military training of officers and men, and besides numerous admirable academies, there are several good schools of operative and veterinary surgery, &c., connected with the educational department of the army. The Prussian navy, included prior to 1871 under the flag of the Confederation of North Germany, numbered in 1870, 81 armed vessels, carrying 548 guns, 5 of which were armour vessels, of 62 guns. Seven men-of-war were constructing, 3 of which are iron-clad. The German navy was manned, in 1870, by 3283 seamen, &c. There are four war-ports, Kiel, Danzig, Stralsund, and Wilhelmshaven, in the bay of Jade, a vast artificial construction of granite, costing upwards of \$7,000,000.

Constitution, &c.—Prussia was an absolute monarchy until 1848. In 1850 a constitution was proclaimed, which has been repeatedly modified. By the decree of 1857, the executive is invested in a king of the house of Hohenzollern, on attaining his 18th year. He is assisted by a council of ministers, appointed and dismissed by royal decree. The legislative authority the king shares with a representative assembly composed of two chambers, the first called the Herrenhaus, or House of Lords, and the second the Abgeordnetenhaus, or Chamber of Deputies. The House of Lords is composed of the adult princes of the royal family and of Hohenzollern, 16 chiefs of the mediatised princely houses, about 50 heads of the territorial nobility formed by the king, sundry life peers chosen by the king from among the rich landowners, great manufacturers, and national celebrities, 8 titled noblemen, elected in the 8 provinces of Prussia by the resident landowners of all degrees, representatives of the universities, heads of chapters, and burgomasters of towns with above 50,000 inhabitants, and finally an unlimited number of persons nominated by the king for life, or for a more restricted period. The Chamber of Deputies consists of 432 members, 352 for the old kingdom, and the rest added in 1867 to represent the newly-annexed provinces. Every Prussian who has attained his 25th year, and is qualified to vote for the municipal elections, is eligible to vote as indirect elector. One direc-

lector is elected to vote for every complete number of 250 souls. The representatives are chosen by the direct electors for three years. The indirect electors are divided into three classes, according to the respective amount of direct taxes paid by each; and the former members are re-eligible. The sittings of the Chambers are public. The members vote according to their free conviction, and are not bound by prescription or instructions, and cannot be called to account either for their votes or for opinions uttered in the chambers. The executive government is conducted by a staatsministerium, a ministry of state, appointed by the king, and holding office at his pleasure, at the head of which, as minister of foreign affairs, is Prince Otto von Bismarck-Schönhausen. The King of Prussia, as Lord President of the German Confederation, has unrestricted command of the army and organization of the naval service, and the appointment of all officers and civil functionaries. Wilhelm I., the present King of Prussia, became, on Dec. 10, 1870, Emperor of Germany, the four states of South Germany having been admitted on that day into the North German Confederation, which transformed itself from a 'Staatenbund,' or league of states, into a 'Bunderstaat,' or united Confederacy, under a common emperor and a central parliament. Each of the provinces of the kingdom is placed under the superintendence of an 'Oberpräsident,' or governor. Each province has also a military commandant, a superior court of justice, a director of taxes, and a consistory appointed by the king, the last divided into three sections, having the superintendence of education, religion, and the public health. The provinces are subdivided into counties, cities, and parishes. The principal functionaries are all elective, but the elections must be confirmed by the king or the authorities. The black eagle on a field argent, surmounted by the open crown, is the special cognizance of P. Proper. The national colours are black and white; the standard is white, bearing the Prussian crowned eagle and an iron cross in the right corner. The eldest son of the king bears the title of Crown-Prince. The ordinary royal residences are the palaces at Berlin, Potsdam, and Charlottenburg. The royal domains were ceded to the state by Frederick-William III. in 1820, on condition of a rental of 2½ million thalers being paid first from them for the king and his family.

According to the estimate of 1870, the receipts were \$121,140,987, and the expenses for the same period, \$116,902,052; with extraordinary expenses amounting to \$4,210,936; while the funded national debt in that year, in addition to debts for railways, &c., amounted to \$271,106,595, and including the debts of the annexed provinces, \$318,700,000.

Taxation.—The indirect taxes are derived from a share of Zollverein customs, duties on meal, slaughter-tax, stamps, turnpike, bridge, harbour, river, and canal dues; direct taxes arise from land and house rates, income, trade and property taxes, railways, &c.

Population, Races.—About 88 per cent. of the population of P. are Germans. Of the Slavonic tribes, the most numerous are Poles, numbering 2½ millions. In Brandenburg and Silesia there are about 85,000 Wends; and in East P., upwards of 147,000 Lithuanians; while Western P. has rather more than 10,000 Walloons, using the French language; intermixed in its generally German population, Silesia has nearly 59,000 Bohemians or Moravians—making in all 2½ millions who do not use the German language, or who employ it only as secondary to their native tongues.

Ranks, Classes.—Three distinct hereditary classes are recognised in P., viz., nobles, burghers, and peasants. To the first belong about 177,000 persons, including the higher officials of the state, although that number does not comprise the various

mediatised houses, of which 16 are Prussian, and others belonging to different states, but connected with P. by still existing, or former territorial possessions. The burgher class includes, in its higher branches, all public office-bearers, professional men, artists, and merchants; while the peasantry—to which belong all persons engaged in agricultural pursuits—are divided into classes, depending on the number of horses employed on the land, &c.

History.—The lands bounded by the Baltic, which now form part of P., were early occupied by Slavonic tribes, nearly allied to the Letts and Lithuanians. It is conjectured that they were visited by Phœnician navigators in the 4th c. B.C.; but beyond the fact of their having come into temporary conflict with the Goths and other Teutonic hordes, prior to the great exodus of the latter from their northern homes, little is known of the people till the 10th c., when they first appear in history under the name of Borussi, or Prussians. In 997, Bishop Adalbert of Prague suffered martyrdom at their hands, while endeavouring to convert the people to Christianity. Boleslas, Duke of Poland, succeeded, however, about 1018, in compelling them to submit to baptism and subjection. After many futile attempts on the part of the people to throw off the yoke of Christianity and foreign domination, they finally made a successful stand against Boleslas IV. of Poland in 1161, and for a time maintained a rude and savage kind of independence, which the disturbed condition of Poland prevented its rulers from breaking down. The fear of losing their freedom if they adopted Christianity, made the Prussians obstinately resist every effort for their conversion; and it was not till the middle of the 13th c., when the knights of the Teutonic order entered upon their 'famous' crusade against them, that the Christian faith was formally established among them. The aggressive inroads of the pagan Prussians on the territories of their Christian neighbours, and their advance into Pomerania, were the exciting causes of this important movement. The knights of the order, when appealed to by Conrad, Duke of Masovia, to aid in the subjection of the heathen, gladly promised their services, on condition of being permitted to retain possession of the lands which they might conquer; and having entered the Prussian territories in considerable numbers, they entrenched themselves at Vogelsang and Nessau in 1230, and at once entered upon the conquest of Prussia. For half a century the belligerent brotherhood were engaged in war with the people—winning lands and souls by hard fighting—until at length, in 1283, they found themselves undisputed masters of the country, which they had both civilised and Christianised after a fashion, namely, by almost exterminating the pagan population. During this period of struggle, the knights founded the cities of Thorn, Kulm, Marienwerder, Memel, and Königsberg, re-peopled the country with German colonists, encouraged agriculture and trade, and laid the foundation of a well-ordered, prosperous state. The unhappy wars between the knights and the Poles and Lithuanians, together with the moral degeneracy of the order, led, in the 14th and 15th centuries, to the gradual decline of their supremacy. In 1454, the municipal and noble classes, with the co-operation of Poland, rose in open rebellion against the knights, who were finally compelled to seek peace at any cost, and obliged, in 1466, to accept the terms offered to them by the Treaty of Thorn, by which West P. and Ermland were ceded by them unconditionally to Poland, and the remainder of their territories declared to be fiefs of that kingdom. In 1511, the knights

ected as their grand-master the Markgraf Albert of Anspach and Baireuth, a kinsman of the king of Poland, and a scion of the Frankish line of the Hohenzollern family. Although his election did not immediately result, as the knights had hoped, in securing them allies powerful enough to aid them in emancipating themselves from Polish domination, it was fraught with important consequences to Germany at large, no less than to the order itself. In 1525, the grand-master was acknowledged Duke of P., which was converted into a secular duchy (afterwards known as East P.), and renounced the Roman Catholic religion for Lutheranism, his example being followed by many of the knights. The country made rapid advances under the rule of Albert, who improved the mode of administering the law, restored some order to the finances of the state, established schools, founded the university of Königsberg (1544), and caused the Bible to be translated into Polish, and several books of instruction to be printed in German, Polish, and Lithuanian. His son and successor, Albert Frederick, having become insane, a regency was appointed. Several of his kinsmen in turn enjoyed the dignity of regent, and finally his son-in-law, Johann Sigismund, elector of Brandenburg, after having held the administration of affairs in his hands for some years, was, on the death of the duke in 1618, recognised as his successor, both by the people and by the king of Poland, from whom he received the investiture of the duchy of P.; which, since that period, has been governed by the Hohenzollern-Brandenburg House.

Here it will be necessary to retrace our steps in order briefly to consider the political and dynastic relations of the other parts of the Prussian state. In the 12th c. the northern Mark, comprising probably the territory between the Elbe and the Oder, as far as its confluence with the Spree, was held by the immediate descendants of Albert the Bear of Luxemburg, its first hereditary markgraf, who, during the next two or three centuries, extended their dominions eastward, beyond the Oder into Further Pomerania. On the extinction of this line, known as the Ascanian house, a remote kinsman, Frederick VI., count of Hohenzollern, and markgraf of Nürnberg, became possessed, partly by purchase and partly by investiture from the emperor, of the Brandenburg lands, which, in his favour, were constituted into an electorate. This prince, known as the Elector Frederick I., received his investiture in 1417. He united under his rule, in addition to his hereditary Franconian lands of Anspach and Baireuth, a territory of more than 11,000 square miles. His reign was disturbed by the insubordination of the nobles, and the constant incursions of his Prussian and Polish neighbours, but by his firmness and resolution he restored order at home and enlarged his boundaries. We are told that he gained possession of the castles of his refractory nobles by the aid of a 24-pounder, known as the Faule Grete; but even this unwonted auxiliary was of no avail in a long war which he waged against the Hussites, who devastated the land, and razed many of his cities in revenge for the part which Frederick had taken in acting as commander-in-chief of the imperial army, which had been sent against them. Under Frederick's successors the Brandenburg territory was augmented by the addition of many new acquisitions, although the system of granting appanages to the younger members of the reigning house, common at that time, deprived the electorate of some of its original domains, as for instance the markgratate of Anspach, which passed, on the death of the Elector Albert Achilles in 1486, as an independent state to his

younger sons and their descendants. The most considerable addition to the electorate was the one to which reference has already been made, and which fell to the Elector John Sigismund through his marriage in 1609 with Anne, daughter and heiress of Albert Frederick, the Insane, duke of Prussia. In consequence of this alliance, the duchy of Cleves, the countships of Ravensberg, the Mark, and Limburg, and the extensive duchy of P., now known as East P., became incorporated with the Brandenburg territories, which were thus more than doubled in area. The reign of John Sigismund's successor, Georg-Wilhelm (1619—1640), was distracted by the miseries of the Thirty Years' War, and the country was alternately the prey of Swedish and imperial armies; and on the accession of Georg-Wilhelm's son, the great Elector Frederick-William (q. v.), in 1640, the electorate was sunk in the lowest depths of social misery and financial embarrassment. But so wise, prudent, and vigorous was the government of this prince, that at his death in 1688 he left a well-filled exchequer, and a fairly-equipped army of 38,000 men; while the electorate, which now possessed a population of one and a half million, and an area of 42,000 square miles, had been raised by his genius to the rank of a great European power. His successors, Frederick III. (q. v.), (1688—1713) and Frederick-William I. (1713—1740), each in his own way increased the power and credit of P., which had been in 1701 raised to the rank of a kingdom. The latter monarch was distinguished for his rigid economy of the public money and an extraordinary penchant for tall soldiers, and left to his son, the great Frederick II. (q. v.), a compact and prosperous state, a well-disciplined army, and a sum of nearly nine million thalers in his treasury. Frederick II. (1740—1786), dexterously availed himself of the extraordinary advantages of his position to raise P. to the rank of one of the great political powers of Europe. In the intervals between his great wars, he devoted all his energies to the improvement of the state, by encouraging agriculture, trade, and commerce, and reorganising the military, financial, and judicial departments of the state. By his liberal views in regard to religion, science, and government, he inaugurated a system, whose results reacted on the whole of Europe; and in Germany, more especially, he gave a new stimulus to thought, and roused the dormant patriotism of the people. Frederick was not over-scrupulous in his means of enlarging his dominions, as he proved by sharing in the first partition of Poland in 1772, when he obtained as his portion, nearly all West-P., and several other districts in East Prussia. His nephew and successor, Frederick-William II. (1786—1797), aggrandised his kingdom by the second and third partitions of Poland in 1793 and 1795. Frederick-William III. (q. v.), (1797—1840), who had been educated under the direction of his grand-uncle, Frederick the Great, succeeded his father in 1797, at a time of extreme difficulty, when continental rulers had no choice beyond being the opponents, the tools, or the victims of French republican ambition. By endeavouring to maintain a neutral attitude, P. lost her political importance, and gained no real friends, but many covert enemies. But the calamities which this line of policy brought upon P. roused Frederick-William from his apathy, and with an energy, perseverance, and self-denial, worthy of all praise, he devoted himself, with his minister Count Hardenberg, to the reorganisation of the state. In the ten years which succeeded the battle of Waterloo, P. underwent a complete reorganisation. Trade received a new impulse through the various commercial

treaties made with the maritime nations of the world, the formation of excellent roads, the establishment of steam and sailing packets on the great rivers, and at a later period the organisation of the customs-treaty, known as the Zollverein (q. v.), between P. and the other states of Northern Germany, and through the formation of an extended network of railways. The most ample and liberal provision was made for the diffusion of education over every part of the kingdom, and to every class. In like manner, the established Protestant Church was enriched by the newly-inaugurated system of government supervision, churches were built, the emoluments of the clergy were raised, and their dwellings improved; but not content with that, the king wished to legislate for the church in accordance with a set plan; and when the various Protestant churches refused to be joined in the Utopian union prescribed for them, difficulties arose. This tendency to over-legislation has long been the predominating evil feature of Prussian administration, and the state, without regard to the incongruous elements of which it was composed, was divided and subdivided into governmental departments, which, in their turn, under some head or other, brought every individual act under governmental supervision, to the utter annihilation of political or mental independence. The people, when they gradually began to comprehend the nature of this administrative machinery, saw that it made no provision for political and civil liberty, and demanded of the king the fulfilment of the promise he had given in 1815 of establishing a representative constitution for the whole kingdom. This demand was met with the most hypocritical and despotic insincerity on the part of the king, who professed to take high religious views of his duty as a sovereign, and its immediate fruits were strenuous efforts on his part to check the spirit of liberalism. Every measure taken by other sovereigns to put down political movements was vigorously abetted by him. Siding with the pietists of Germany, he introduced a sort of Jesuitical despotism, which has been continued by his sons, the late and the present king. The Landstände or provincial estates, organised in accordance with the system of the middle ages, were the sole and inadequate mode of representation granted to P. in this reign, notwithstanding the pledge made to the nation for a full and general representative government. An attempt made forcibly to unite Lutheran and Reformed Churches excited universal indignation, while the imprisonment, at a later period, of the Archbishops of Cologne and Gnesen for their conduct in regard to the vexed question of mixed marriages, involved the king in a long and fruitless dispute with the pope. The accession of Frederick-William IV. in 1840 seemed to open a better prospect to the friends of constitutional freedom, but the reality was scarcely equal to the expectations which had been warranted by the professions of the government. Still new hopes and requirements had been excited, and a new life was infused into every department of the state. Every branch of science, art, and literature was understood to receive the attentive consideration of the sovereign, who professed to be actuated by a love of universal progress. He made similar professions in regard to religious toleration, but the pietistic tendencies of his government exerted a forced and prejudicial influence in every department of the state; while the bureaucratic spirit of over-governing which characterised the administration was becoming daily more and more irksome to the nation, and gave rise to the formation of free churches or Protestant communities; while a contemporaneous excitement which had

arisen in the Roman Catholic Church of P., as the result of the schismatic movement due to the stand taken by the chaplain Ronge (q. v.) on the exhibition of the so-called Holy Coat of Treves (q. v.), further complicated the relations between church and state. The king and his advisers, underrating the importance of the movement of 1848 in Germany, thought they had satisfied the requirements of the hour by granting a few unimportant reforms, and making equivocal promises of further concessions. When at length, however, the citizens and troops came into collision, and blood was shed, Frederick-William came forward as the professed regenerator of his country, offering to lay down his royal title and merge his kingdom in the common fatherland, for the salvation of which he recommended a cordial union of all German princes and people in one bond, and proposing himself as the guide and leader of this new Germany. His own subjects, and at first many Germans in other states, were carried away by these Utopian schemes. The publication of a political amnesty, the nomination of a liberal ministry, the recognition of a civic guard, the retirement of the Prince of Prussia, the heir-presumptive—with whom every arbitrary measure of government was believed to originate—and the summons of a representative chamber to discuss the proposed constitution—all tended to allay the general discontent. But when the national assembly at Frankfurt, in disregard of the wishes of the Prussian king, declined to accept his proffered services, and elected the Archduke John of Austria lieutenant-general of Germany, his ardour in the cause of the fatherland cooled, his pledges to his own subjects were evaded as long and as completely as the occasion permitted, and his policy became more strongly tinged than before with a jealousy of Austria. His powerful co-operation in putting down the insurrection in Poland, and the democratic party in Baden, gave, however, ample proof of his determined opposition to every popular demonstration against absolutism. In the war of the Slesvig-Holstein duchies, the Prussians acted in concert with the disaffected against their sovereign, the king of Denmark, occupying the ducal provinces in the name and on the behalf of the diet. The latter years of this reign were characterised by great advance in the material prosperity and internal improvement of the country. Extensive lines of railway and post-roads were opened, the river navigation greatly facilitated, treaties of commerce formed with foreign countries, and great expansion given to the Prussian and North German Zollverein (q. v.), the army put upon a footing of hitherto unprecedented efficiency of arms and artillery, and the educational system of the country still further developed. The political freedom of P. cannot, however, be said to have made equal advance. The chambers which met for the discussion and framing of a constitutional mode of government, were constantly interrupted and obstructed in the prosecution of their task, and the constitution, which is now established by law, was modified every year between 1850 and 1857, until it may be said to retain few of its original bases; while the practical despotism of Frederick-William IV., and of his brother, the present king, who succeeded him in 1861, aided by the audacity of Count von Bismarck, succeeded in placing an effective check on all measures proposed by the body of representatives which might have a tendency to interfere with the absoluteness of the regal power, or to promote the advance of thought and the progress of political freedom in the Prussian dominions.

The conflicts between the government and the representatives of the people remained unsettled in the Legislature of 1866, and the Chamber of Deputies was

dissolved. A new election took place under the influence of the victories gained by the Prussian army, and resulted in a large addition to the Conservative party, and an immense majority was found to approve of the foreign policy of the government, though considerable animosity continued to be exhibited when financial questions were agitated.

The German-Italian war of 1866 resulted in the annexation to P. of Slesvig-Holstein (q. v.), Hanover (q. v.), Hesse-Cassel, Frankfurt, Nassau, Lanenburg, part of Hesse-Darmstadt, and a small district ceded by Bavaria. The success of P. in this war exceeded the boldest anticipations, the ability of her generals, the bravery of her troops, and the efficiency of the needle-gun having astonished the world. After a brief and decisive campaign, P. dictated the terms of peace with Austria and the South German states, by which Austria renounced all connection with the German Confederation (q. v.), and consented to the construction of a new German Confederation under the leadership of Prussia. The aggrandisement of P. led to a demand on the part of France for the cession of a portion of Prussian territory, which was firmly refused. The Franco-German war of 1870—1 having resulted in successfully repelling the projected French invasion, the N. G. Confederation of 1867 was merged into a reconstructed Germanic empire. Pending their union under one government, the states of the empire were ranged provisionally under two groups, as North Germany and South Germany. By treaty at Versailles, in Nov. 1870, ratified by the Diet of N. Germany, Dec. 10, 1870, the four southern states were admitted into the N. G. Confederation, and the whole became united under a common emperor and a central parliament, the K. of Prussia having been the chosen chief and declared emperor on the 170th anniversary of the day when the Elector of Brandenburg assumed the crown of Prussia. See GERMANY, in SUPPLEMENT, in Vol. X.

PRYNNE, WILLIAM, noted as a pamphleteer and active politician during the reign of Charles I., and the subsequent period of the Commonwealth, was born near Bath in the year 1600. He received his early education there, and was afterwards transferred to Oriel College, Oxford, where, in 1620, he took his bachelor's degree. Selecting the law as his profession, he entered himself at Lincoln's Inn, where he became a bencher and reader; but it does not appear that he ever very seriously endeavoured to obtain practice at the bar. He was early drawn into the vortex of ecclesiastical controversy, and speedily made himself heard of as a champion of the Puritan party. In 1632, appeared his *Histriomastix, or a Scourge for Stage Players*, a tasteless and scurrilous attack on the popular amusements of the period, which procured him the attention of the authorities. For this performance he underwent prosecution in the Star Chamber, with results sufficiently unpleasant. His sentence involved him in a fine of £3000, degradation from the bar, expulsion from Oxford and Lincoln's Inn, the loss of both his ears in the pillory, and the shock to his vanity as an author, of seeing his book burned in public by the hangman. He was, moreover, condemned to perpetual imprisonment, and immured in the Tower accordingly. If the severity of the punishment seems, at first sight, astounding in its disproportion to the nature and amount of the offence, it is perhaps sufficiently explained by the fact, that P., by his previous issue of a series of anti-prelatical tracts, as by other indications of hostility, had made himself most obnoxious to Archbishop Laud and the clergy.

Three years after, the pertinacious offender found means to publish from his prison another pamphlet, in which he fiercely attacked the hierarchy, and was unsparing in his personal abuse of Laud and certain other bishops. For this he was again prosecuted; a fine of £5000 was imposed upon him; he was once more pilloried, losing such stumps of ears as the executioner had before spared; and was branded on both cheeks with the letters S. L. (Seditious Libeller). He was then removed to Caernarvon Castle, and afterwards to that of Mont Orgueil, Jersey, where he remained a close prisoner, till, in 1641—the Long Parliament then sitting—he was released by a warrant of the House of Commons, and a tumultuous expression of popular sympathy celebrated his restoration to liberty. Shortly afterwards, he was sent to parliament as member for Newport, in Cornwall, and for some years was actively, and, at times, even prominently engaged on the popular side in the proceedings of the House of Commons. In the extreme measures, however, leading to the deposition and death of the king, he declined all share; and being one of those of whom Cromwell shortly after 'purged' the House of Commons, he proceeded to assail him in print with an asperity not inferior to that with which he had before made war upon the bishops, as a consequence of which imprudence he was once more subjected to several years' imprisonment. On Cromwell's death he returned to his place in parliament, zealously interesting himself in the royal cause; and after the Restoration, the office was bestowed on him of Keeper of the Records in the Tower. Subsequently, his inveterate habit of venomated pamphleteering involved him in difficulties with the House of Commons, from which, on a charge of seditious libel, he narrowly escaped expulsion. He died at Lincoln's Inn in October 1669. The continuous stream of writings on the perilous topics of the day, which brought him so constantly into trouble, represents but a fraction of P.'s literary activity. He busied himself chiefly as a compiler of matter illustrative of constitutional and parliamentary history. His most valuable works in this field are the *Calendar of Parliamentary Writs*, and his *Records*, both of which contain much that is useful and important.

PSALMANAZAR, GEORGE, a somewhat remarkable impostor, was born about the year 1680. His real name and the place of his birth are unknown, but he is presumed to have been a native of Switzerland or the South of France. He received a good education, and gave early indication of talent, more especially for the acquisition of languages. Impelled by a restless and impatient temper, which indisposed him to any regular pursuit, for some years he roamed over Europe as a mere vagabond adventurer, assuming at first the disguise of an Irish pilgrim, exiled on account of his religion; and afterwards as soldier, menial, preceptor, beggar, or vagrant nondescript, living on his wits as he could, according to the whim or necessity of the hour. In the course of his wanderings, he was thrown into contact with a Colonel Lauder, commanding a Scotch regiment at Sluys, on whom he first passed the imposture to which he subsequently owed his notoriety, assuming the name by which he is since known, and representing himself as a Japanese convert to Christianity and native of the island Formosa. The good colonel seems to have been completely deceived by him; not so, however, the chaplain of the regiment, one Innes, a man equally acute and unprincipled, who speedily detected the deception, but was not the less willing to use it for the furtherance of his own ends. By Innes, P. was brought to England, and instantly became the

religious lion of the day, his patron skilfully availing himself of the connection to secure for himself preferment in the church. Dignitaries of the church contended for the honour of being serviceable to him; and through the influence of the Bishop of Oxford apartments were assigned him at the university, in order that he might prosecute his studies there. The talent, ingenuity, and resource which he displayed in keeping up the deception, go far to account for what may seem to us the strange credulity with which his story was received. He published, in Latin, a fabulous account of the island Formosa, the consistency and verisimilitude of which imposed upon the learned world. He also invented a language, compact and somewhat complex in structure; and was able, in virtue of a memory not less than astonishing, to defy the ordinary methods of detection. In the midst of his success, however, at the age of about 32, he became the subject of religious impressions, and his conscience awoke to the ignominy of the deceit which he was practising. Urged by what seems to have been a genuine feeling of penitence, he withdrew himself from public notice, and for the rest of his long life honourably earned his livelihood by literature, in which he had a moderate success. Besides much assiduous compilation for the booksellers, of history, geography, and the like, he published several works anonymously, one of which, *An Essay on Miracles, by a Layman*, was for some time exceedingly popular. On his death in London in 1762, it was found that he had also busied himself in preparing for posthumous publication an account of his curious career, which, under the title *Memoirs of —, commonly known as George Psalmanazar, a reputed native of Formosa, written by himself*, was some years after given to the world.

PSAL'MODY, in its widest sense, is the singing of the Psalms of David and other sacred songs; but from the beginning of the Reformation period, the term has been restricted to the singing of metrical versions of the Psalms to short simple airs. Psalm-singing was of ancient date among the Jews, and was practised from the first ages of Christianity; the charge of Pliny the Younger against the Christians was, that they sung psalms to Christ '*quasi Deo*.' No authentic record, however, exists of the kind of melodies sung to the psalms by the primitive Christians. The practice of singing psalms in antiphony, or by two choirs, as still practised (see ANTIPHONY), was introduced at an early period; it is said to have been begun in the Eastern Church by Ignatius, Bishop of Antioch, in the 2d c.; and in the Western Church by Ambrose, Bishop of Milan, in the 4th century. At first, the whole congregation, clergy and laity, joined in the psalm; but difficulties and abuses arose from the growing neglect of musical cultivation; and with a view of restoring public decency and order, the Council of Laodicea, in the year 363, considered it necessary to forbid the laity to sing in church at all, except in certain simple chants of a popular description. Down to the Reformation, the music of the church was surrendered to the clergy and trained musicians.

Psalmody, in the more modern sense, began in the 16th c., when Clement Marot, the court-poet of Francis I. of France, translated 52 of the Psalms into French verse, dedicating them both to his royal master—whom he likened to the Hebrew psalmist—and to the ladies of France. The sacred song-book, on its first appearance, not being accompanied by music, it became the practice to sing the psalms to favourite tunes—often those of popular ballads, and for a considerable time, psalm-singing became a favourite fashion among the gay courtiers of Francis.

Marot's collection was continued and concluded by Theodore Beza, whose psalms had the advantage of being set to music, Beza having in this the assistance of Calvin, who engaged the best composers of the day to unite his sacred songs with beautiful and simple airs of a devotional character. Psalm-singing was taken up by the Reformers, first for private devotion, and soon as part of the service of the church, Luther and Calvin restoring to the people their share in the musical part of public worship, and furnishing them with the means of performing it. From the time that psalm-singing was adopted by the Reformers, it was discountenanced by the Roman Catholics, and soon came to be regarded as a badge of Protestantism. Luther and Calvin differed, however, in their ideal of psalmody; the former was favourable to harmony in parts, while the latter confined himself to the bare unaccompanied melody. Once taken up by the Calvinists and Lutherans, psalmody spread over France, Germany, and the Low Countries, and reached England at the moment of her embracing the Reformation. The first English metrical version of the Psalms was made in the reign of Henry VIII. by Thomas Sternhold, a native of Hampshire, groom of the robes to King Henry, aided by John Hopkins and William Whytinghame. Vocal psalmody was soon after introduced into the church-service, the choral mode of singing being still retained in cathedrals and collegiate churches, and the liturgic hymns being retained in the prayer-book. Of the psalm-tunes which came into use, some have been attributed to Claude Goudimel, Claude Le Jeune, and Guillaume Franc, and a few owe their origin to Luther. The well-known 100th Psalm is an adaptation of Gregorian phrases by Guillaume Franc. The first important collection of psalm-tunes for four voices published in England was made by Thomas Ravenscroft, Mus. Bac., and appeared in 1621; it was entitled '*The whole Booke of Psalms, &c.*, composed into four parts by sundry authors, to such several tunes as have been and are usually sung in England, Scotland, Wales, Germany, Italy, France, and the Netherlands.' In this collection were included contributions by Tallis, Morley, Dowland, and all the great masters of the day, as well as by Ravenscroft himself, who contributed the tunes St David's, Bangor, and Canterbury. The name of John Milton, father of the poet, appears as composer of the tunes, York and Norwich. According to the then prevalent usage, the subject or air was given to the tenor voice. This custom was first departed from in the *Whole Book of Psalms, in Three Parts*, published in 1671, compiled and arranged by John Playford—whom Sir J. Hawkins calls the 'father of modern psalmody'—where we have the more proper practice, which has since obtained, of making the melody the soprano part. Croft, Courteville, Cary, the Bachs, and Handel have, since that time, contributed to the psalmody in use in Britain.

Among other metrical versions of the Psalms produced was one of doubtful origin which was attributed to James I.; and which, notwithstanding a strong recommendation by his son, was never much used in churches. The version of the Psalms by Sternhold and Hopkins came to be supplanted in England, towards the beginning of the last century, by that of Nahum Tate, poet-laureate under William III. and Anne, and Dr Nicholas Brady, less literal in its renderings than its predecessor, and somewhat commonplace as regards poetical character. This *New Version of the Psalms* first appeared in 1698, with the royal authority allowing its use in churches. Of late years, modern hymns, selected according to the taste and at the will of

the incumbent, have to a large extent taken the place of metrical psalms in the Church of England.

In Scotland, the early Reformers, while they banished instrumental music from churches, paid great attention to singing. In John Knox's Psalter, arranged for use in churches, the metrical psalms are set to music in harmony of four parts. Several early translations of the Psalms were produced in North Britain, but that of Sternhold and Hopkins was used in worship from 1564 down to the middle of the 17th century. In 1632, an attempt made by Charles I. to supersede it by King James's version, was more resolutely and decidedly opposed than in England. The version now in use in Scotland was introduced during the Commonwealth by the General Assembly, and founded on the metrical translation of Francis Rous, a member of Cromwell's council, which parliament had in vain endeavoured to bring into general use in England. This new version was in 1649 appointed by the General Assembly to be the only paraphrase of the Psalms sung in the Kirk of Scotland, and all other versions were prohibited to be made use of not merely in congregations, but in families, after 1650. Though somewhat rough and uncouth, it is sometimes expressive and forcible, and perhaps nearer the original than any other metrical translation of the Psalms. A few Paraphrases and Hymns have since been added, by authority of the General Assembly, and form together the psalmody in use in Presbyterian worship in Scotland.

PSALMS (Heb. *Tehillim*, Songs of Praise, or *Tefilloth*, Prayers; Jerome, *Liber Hymnorum*), the well-known canonical book generally ascribed to David. The single hymns contained in the book are variously designated either as 'Prayer' (*Tefilla*), as 'Praise' (*Tehillah*), or from some special characteristic 'Song' (*Shir*), or a song of deeper meaning, (*Michtam*), 'Instruction' (*Maskil*), or a dithyrambic poem (*Shigayon*). Respecting the general contents of the book, it may be said that it comprises, in the form of pious lyrics, written for and on behalf of the congregation, the quintessence of the dogmatical, ethical, historical, and theological portions of the Old Testament. The divine essence and qualities, providence and its guidance—especially of Israel—the rule of the universe, the nature of the human heart and its relations to God and His revelation, the blessings of the theocratic community; these and similar reflections form the themes of its ever-varying modes. A certain more spiritual conception of the ordinances of the Pentateuch is visible throughout, and although the strictest adherence to these is enjoined, yet their deeper meaning is impressed more strongly still. Used as a liturgical hymn book in the Temple, it has been bodily received for the same purpose in the Christian church; and certain additional hymns which occur in the Greek and Syriac Psalter have not been sanctioned by the authority of the general church. There are, in all, 150 canonical hymns or psalms, which, after the model of the Pentateuch, have been divided into five books—thus: i.—xli.; xlii.—lxxii.; lxxiii.—lxxxix.; xc.—cvi.; and cvii.—cl. The Syriac, the LXX., and the Vulgate Versions differ in some respects in their counting. The Authorised Version, however, follows strictly the Masoretic Jewish text, except with regard to the numbering of the verses; for while the latter includes the superscriptions among the verses, the former does not reckon those. This division into five books is, as it is traditional, also the most natural; and the doxologies at the ends of psalms xli., lxxii., lxxxix., and cvi., further mark authoritatively the respective ends of the special divisions. A further division, or rather classification, has been

attempted according to the contents; but, considering the constantly changing variety of moods and sentiments of manner and contents which these songs exhibit, it is a most precarious one.

The Psalms have generally—thirty-four only excepted—superscriptions more or less expressive of the contents of the special hymn, and sometimes with, sometimes without, the name of an author. In some, certain notes, referring to the musical and liturgical part, are added, which are far from being quite clear now, e.g., 'On the octave,' 'For the chief musician,' 'On Machalath' (illness?), 'In the time of death to the son,' 'The hind of Aurora,' 'Lilies,' 'Dumb dove of the far ones,' &c. One of the greatest puzzles is the word *Selah*, which occurs several times at the end, or in the middle of some psalms, and which the LXX. render *Diapsalma*, 'Interlude,' but about the real signification of which, numerous yet very unsatisfactory suggestions have been made at various times. Thus, it has been identified with *amen*, *hallelujah*, *piano*, &c. So much seems certain, that it was a kind of catch-word or sign for the performers. These headings belong very probably to the individual poets themselves, and not to the collectors, as has been surmised.

The authorship of the Psalms is ascribed by the headings of the various chapters as follows: Psalm xc.—one of the most ancient in form and contents—is attributed to 'Moses, the man of God.' Seventy-three psalms are inscribed with David's name; two with Solomon's; twelve with that of Asaph, the Levite and singer, of which five, however, belong to the times of Jehoshaphat, Hezekiah, and the beginning of the Babylonian exile respectively. Eleven psalms go under the name of the Sons of Korah, or the Korahites—a family of singers descended from the Levite Korah, known from the Pentateuch. Their head at the time of David was Heman. Part of these psalms belongs to the time of David; others, to that of Solomon, and others are of an uncertain later period. Respecting the psalm inscribed 'Prayer of Moses,' there seems, indeed, to be no valid reason against its authenticity; it is quite worthy of the great legislator, and to a certain extent similar to other compositions of which he is reasonably regarded as the author. The numerous body of psalms attributed to David, manifest (those at least which can fairly be believed to be his work) a vivid and profound feeling and rare poetical gifts. The singer abandons himself entirely to whatever feeling of joy or grief, repentance or revenge, piety or despair, sweeps over his soul. This also accounts to a certain extent for the violent manner in which he calls down at times the vengeance of God upon the heads of his adversaries; while at others, he humbles himself to the dust on account of his own iniquities. On his style and manner, we cannot enlarge here; suffice it to add, that his lyrics have deservedly been counted among the gems of all human literature for well-nigh 3000 years—quite apart from their sacred liturgical character. Asaph's psalms shew their author to have been a didactic poet of high order; but, as we said before, many of those ascribed to him belong to poets later than the schism, and even posterior to the Exile. The Korahite hymns, although all more or less fraught with the same depth of feeling, the same conciseness, the same grandeur and lyrical exaltation, exhibit signs of being written partly during the time of Solomon, or even during the Exile. Of the anonymous psalms, some may fairly be added to the number of those that issued from the hand of the royal singer himself; others, however, belong to the post-exilic times. Some of these (the *hallelujahs*, for instance, or the 'Songs of

Degrees') were, in all probability, pilgrim-songs, chanted during the ascent to the sanctuary. Whether other psalms belong to the Maccabean period or not—a question hotly disputed—we cannot discuss here.

There is a great deal in favour of the opinion that the collection and redaction of the book, such as we have it now, is owing to one man, who arranged the single hymns according to their contents and tendency. Thus, following all the while the law of analogy, the redactor gave the first place to David's and his contemporaries' (Asaph, Ethan, Heman) compositions. These were further classified according to the prevalent use of the peculiar divine name (Jehovistic and Elohistie), and were divided into three books—the first of which contains the Davidic Jehovistic psalms; the second, the Elohistie ones of the Korahites, of Asaph, David, Solomon, and some unknown poets; the third, the rest of Asaph's and the Korahite psalms of a mixed (Jehovah-Elohistie, or purely Jehovistic) nature. The arrangement within these larger classes was made, again, according to the inner nature and relation of these hymns to each other, and by a certain likeness in phraseology, similes, &c. Psalms i. and ii. were then prefixed, on account of their generally introductory matter and manner. The same laws have also been followed in the remaining portions of the collection.

It is difficult to fix the period of the redaction. Assuming, however, the collecting and editing to be the work of one man, he could not possibly have lived before the time of Nehemiah, even according to those who affirm the non-existence of Maccabean psalms in our canon. If, on the other hand, various single collections are assumed, out of which our present book has grown, there is no reason why some of those should not be placed at a much earlier date. We forbear to add a list of writers on the subject of psalms. Nearly all the principal authorities in biblical literature, in the Jewish, Roman, and Protestant churches, have contributed their share towards the elucidation of the Psalms; and to the individual works of the chief biblical commentators, the reader is referred for special information. Le Long, in his *Bibliotheca Sacra*, enumerates more than 500 commentators on the Psalms, and Calnet carries the number up to a thousand. Of these, some are very voluminous, that of Le Blanc filling no fewer than six folio volumes.

PSAMMETICHUS, the name of three kings of Egypt, of the 26th dynasty, distinguished on the monuments by different prænomena, and of two other persons of ancient history. The first and most notable P. was the son of Necho I. After the defeat and death of his father, he fled into Syria, and thence, by means of foreign aid, appears to have established himself as one of the twelve monarchs who then reigned over Egypt, with the rest of whom he was connected in a kind of federation. An oracle having declared that the monarchy of the whole country should go to that one who made a libation out of brass, P. fulfilled the condition by pouring it out of a brazen helmet. By the answer of another oracle, he was told that he should succeed by means of brazen men who would appear from the sea. Some Carian and Ionian pirates who appeared soon after in panoplies of brass on the shores of Egypt, answered the response of the oracle. P. engaged them in his service, and by their means finally subdued his rivals at Momemphis, after a struggle of fifteen years' duration. He strengthened his power by employing Greek mercenaries, whom he settled at Daphnon and Pelusium, to protect the eastern

borders of Egypt, and whose headquarters were subsequently transferred to Memphis. To them he assigned the right wing, or post of honour, in the army—their arms and discipline being far superior to that of the native troops. This proceeding gave great disgust to the Egyptian army, and on his refusing to send the Greeks home, after their term of service, the Elephantine garrison, of 240,000 men, deserted the country, and marched into Ethiopia beyond Meroë. Although exhorted, they refused to return. To protect Egypt from the Syrians, he besieged Azotus, which he finally took, after 29 years' siege. P. fostered in every way the Greek influence in Egypt, divided amongst them lands, encouraged the study of the language, and contracted alliances with the Athenians. He also facilitated the commerce, and opened the ports which had been hitherto closed. Under P., the arts revived, the sculpture and architecture imitated the older prototypes, and the government was remodelled on the plan of the ancient dynasties. In literature, a new handwriting, the demotic, was introduced. Egypt, however, had fallen into a national decadence, and its old polity and institutions, subverted by the foreign influence prevalent in the country, could not be restored. P. reigned, according to Manetho, 54 years; his reign closed about 609—610 B. C.—Herodotus, ii. 154; Pliny, *Nat. Hist.* vi. 35; Diodorus, i. 67; Champollion-Figeac, *L'Égypte*, pp. 367—370; Sharpe, *Hist. Egypt*, p. 58.

PSIDIUM. See GUAVA.

PSITTA'CIDÆ. See PARROT.

PSKOV (*Ger. Pleskau*), a government in the north-west of European Russia, lies south of the governments of St Petersburg and Novgorod. Area, 17,315 square miles; pop. 775,701, almost all Russians, except in the western districts, where there is a small number of Finns. The climate is temperate, the surface is hilly in the west, and the soil is of average fertility. Lake Pskov and Lake Ilmen receive almost all the drainage of the government, the river Velikaia falling into the former, and the Shelon, the Polista, and the Lovat into the latter. The rivers are navigable for rafts, and, nearer their mouths, for barges and ships. Lakes abound in the eastern and south-eastern districts. Agriculture is the staple employment; flax-growing being the most remunerative branch. The manufactures carried on in the government are inconsiderable. The St Petersburg and Warsaw Railway, by which ready access is afforded to the metropolitan market for the agricultural productions of P., is expected to have a beneficial influence in developing the industry and resources of the government.

PSKOV, a town in the north-west of European Russia, capital of the government of the same name, stands on the banks of the Velikaia, 180 miles south-south-west of St Petersburg by railway. During the 14th and 15th centuries, it made one in the confederation of the Hanse Towns, and had then a population greater than at present. In 1510, it was annexed to the kingdom of Moscow. During the wars with Lithuania, P. was a stronghold of great importance. It contains a cathedral, 41 churches, and 4 monasteries. Fish, obtained from Lake Peipus, and flax, are the principal articles of a foreign commerce which is not extensive. Pop. about 15,000.

PSORALEA, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having the calyx permanent after flowering, and its tube sprinkled with callous points; the legume one-seeded, sometimes ending in a beak. The flowers

are blue, purple, or white. The leaves are of various forms, but in general abruptly pinnate. Some of the species are natives of India; others of other warm countries.—*P. esculenta*, the BREAD-ROOT of North America, and *Prairie Apple* of the Canadian boatmen, is an herbaceous perennial, about a foot high, with a carrot-like root, swollen above the middle, and abounding in farinaceous matter. It is used as an article of food, both boiled and raw. In Britain, it requires the protection of a frame, in order to produce an abundant crop or large roots.

PSORIASIS (from the Greek word *psora*, which signifies a cutaneous eruption, supposed by some to be the itch) is now employed to signify a disease characterised by slight elevations of the surface of the skin covered with whitish scales. There are various forms of this disorder, such as *P. guttata* (which is the simplest kind, and derives its specific name from the scales not coalescing, but remaining distinct, like isolated drops of water on the skin); *P. diffusa*, when the disease spreads over large portions of the skin, and often renders the patient hideous to look at, the scaly incrustations being often interspersed with bleeding cracks and fissures in all directions; *P. inveterata*, which is merely the severest phase of the preceding form, and occurs chiefly in aged persons of broken-down constitution; and *P. gyrata*, a rare form, in which the disease occurs in narrow stripes or rings. The causes of psoriasis are very obscure. It is certainly not contagious, but there appears to be in some families an hereditary tendency to it. It is occasionally associated with gout and rheumatism. Persons of both sexes, of all ages, and of all conditions of life, are liable to it, although it is more common in middle and advanced life than in childhood. The treatment varies with the condition of the patient. A middle-aged, vigorous patient should be purged two or three times a week with sulphate of magnesia, should be restricted in his diet to vegetables and milk, should be debarred from all stimulants, and should take a warm bath daily. The internal remedies of most repute for this disease are—1. Decoction of dulcamara, from half a pint at first to a pint being taken in divided doses through the day; 2. Liquor potassæ, in doses of from half a drachm to a drachm, three times a day, in a glass of milk or beer; 3. Liquor arsenicalis, in doses of from three to four minims, three times a day, to be taken after meals; 4. Iodide of potassium, in five-grain doses, three times a day; and 5. Pitch pills. In very inveterate cases, tar ointment, first diluted with lard, or a weak ointment of iodide of sulphur, should be applied locally; but these should not be tried unless internal treatment fails.

PSYCHÉ (Gr. breath, or soul), a creation of the later mythology of Greece, or perhaps we should rather say, a personification of the human soul, devised by the later poets. Appuleius (q. v.) relates the following story about her, which is obviously allegorical. P. was the youngest of three daughters of a king. She was so exquisitely beautiful that mortals mistook her for Venus, and did not dare to love, but only to worship her. This excited the jealousy of the goddess, who sent Eros (Cupid) to inspire P. with a passion for the most contemptible of all men; but Eros was himself wounded as deeply by her glances as ever he had wounded others with his darts. Meanwhile, P.'s father wished to see his daughter married, and inquired about her at the oracle of Apollo, by whom he was told to bear the maiden in funeral robes to the summit of a hill, and

to leave her there alone, as she was destined to be the bride of a huge all-destroying snaky monster, that terrified both gods and men. Amid loud wailing and lament, P. was borne to the fatal spot, and left trembling in horrible solitude, when suddenly a light-winged zephyr flew round her, and bore her off to a beautiful palace of pleasure belonging to Eros, who visited her, unseen and unknown, every night, and left her before morning broke. Here P. would have enjoyed perpetual delight, had she remembered the advice of her unknown lover, who warned her not to seek to know who he was. But her jealous sisters, whom, against Eros's injunction, she had allowed to visit her, working upon her curiosity, persuaded her that she was embracing a monster in the darkness of night; and having lighted a lamp when Eros was asleep, she saw with rapture that she was the mistress of the most handsome of gods. In her excitement, she let a drop of hot oil fall on the sleeper's shoulder, who awoke, upbraided her for her mistrust, and vanished. P. gave way to the most passionate grief; she even thought of drowning herself. After wandering about for some time, she came to the palace of Venus, where she was seized by the goddess, and kept as a slave. Eros, however, who still loved her, invisibly helped and comforted the hapless maiden, reconciled her to his mother, and was finally united to her in immortal wedlock. All critics have agreed to consider the story an allegory of the progress of the human soul through earthly passion and misfortune to pure celestial felicity.

PSYCHOLOGY. See MIND.

PTARMIGAN (*Lagopus*), a genus of *Tetraonidae*, differing from the true Grouse (q. v.) chiefly in having the toes thickly clothed with short feathers as well as the legs (*tarsi*). Hence the name *Lagopus*, a name used by Pliny, from the resemblance of the

Common Ptarmigan (*Lagopus mutus*).

foot to that of a hare. The bill is very short, and clothed at the base with feathers. The species are natives of the northern parts of the world, and either of elevated or of strictly arctic regions. They are not polygamous, like the true grouse, nor do the males strut with erected and expanded tail. Most of the species change colour very much on the approach of winter, assuming a white, or nearly white plumage; and the diversities of colour have caused some confusion and difficulty concerning them. They are all much esteemed for the table. The Common

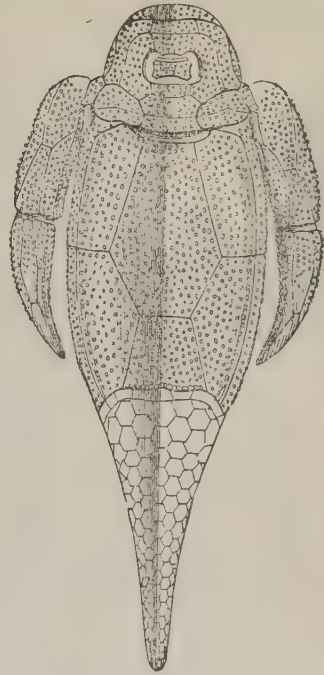

P., or **GRAY P.** (*L. vulgaris*, or *L. mutus*), is a native of the most northern parts both of the Old and New Worlds. It is abundant in Norway, from which great numbers are annually brought to the London market. In arctic countries, the haunts of the *P.* are not mountain-tops, but low valleys and plains even to the sea-shore. In form and habits, it much resembles the Moorfowl (q. v.), but is rather smaller. The winter plumage is pure white, except a black band above the eye of the male, and some parts of the quill and tail feathers. The summer plumage is as beautifully adapted to the concealment of the bird from enemies, by its harmony with the general aspect of the ground, as that of winter; the male being mostly brownish-gray, with undulating lines of black; the wings, middle tail-feathers, and under parts of the body, white; the female similar, but with a prevalent yellow tinge. The plumage, however, varies very much, according to age, sex, and the season of the year. Ptarmigans seem to trust very much for safety to the facility with which they are able to elude observation, whether among the snows of winter or the lichen-covered rocks in summer, and an unaccustomed sportsman is often startled by a covey springing up close beside him, of which he had not previously observed one. The *P.* is capable of being tamed, and has even been found to breed in confinement. The voice of the *P.* is a low croaking cry. The name *P.* is a modification of the Gaelic name. The *Rock P.*, said to occur in the north of Scotland, and to be common in Norway, seems to be merely the common species in a particular state of plumage. The Moorfowl (q. v.) is a species of Ptarmigan.—Another is the *WILLOW P.*, or *WILLOW GROUSE* (*L. saliceti*), of the northern parts of the world, abundant in the arctic parts of America, and in Norway, from which great numbers are sent to the London market. Its summer plumage much resembles that of the moorfowl; but its winter plumage is white. It does not inhabit regions so cold or lofty as the common *P.*, but loves thickets of willow and dwarf-birch. It is found in Europe as far south as the valleys of the Alps. In North America, it is partially migratory.—There are other species in Siberia, Iceland, the Rocky Mountains, the mountains of Mexico, &c.

PTERICHTHYS (Gr. wing-fish), a genus of fishes, peculiar to the beds of the Old Red Sandstone measures. Fragments of the bony case had been found in Russia as early as 1813; in 1840 they were ascribed to a fish named *Asterolepis*. In the same year, the late Hugh Miller exhibited the first specimen which gave an idea of the form of the fish, and to this Agassiz applied the name of *P.*, from the wing-like appearance of the pectoral spines.

The relations of these fishes are, according to Huxley, to the *Nematognathi*, or cat-fishes. They were placed by Agassiz among the *Ganoids*, which however is not a homogeneous division.

The head and anterior half of the body were covered with hard ganoid plates, fitting closely to each other, and forming a strong protecting case. The remainder of the trunk was flexible, and covered with small scales. The fish was furnished with a small dorsal fin, and the body terminated in a heterocercal tail; but neither of these, from their soft texture, is common in the fossil specimens. The creature was not fitted for rapid motion. The pectoral spines, which were supposed to be fins, were probably used as weapons of defence, and perhaps they were also of service in assisting the *P.* to move along the sandy bottoms on which it lived. The spines were composed of two segments, and were covered with tubercles like the trunk. Twelve species of the genus have been described.

PTEROCLES. See **GANGA.**

Pterichthys Milleri (Dorsal Surface).—From Owen.

PTERODACTYL (Gr. wing-finger), a remarkable genus of fossil lizards, peculiar to the Secondary strata. Its anomalous structure was long a puzzle to comparative anatomists. Blumenbach considered it a palmipede, or web-footed bird; while its original describer, Collini, and other more eminent naturalists, referred it to the mammalia, finding its nearest ally in the bat. The careful investigations of Cuvier, however, shewed that the *P.* was a true lizard, but possessed of the power of flight, which it performed, not by a membrane stretched over its ribs, like the living dragons, but more as in the bats, except that the wing was attached, not to several, but only to a single finger—the fifth—the others being free and short. The bones of the fifth finger were very greatly elongated, and the last joint terminated in a long, slender, unguarded apex; the terminal joints in the other fingers were furnished with strong claws. Mantell thus graphically describes the genus: 'With a long-snouted head and long neck much resembling that of a bird, bat-like wings, and a small trunk and tail, with lacertian affinities in its skull, teeth, and skeleton, and with a bird-like structure of sternum and scapular arch, these creatures present an anomaly of structure as unlike their fossil contemporaries as the duck-billed *ornithorhynchus* of Australia to living mammals. The cranium is small; the jaws are long, and either armed with numerous, sharp-pointed teeth, or toothless, like those of a bird. The eye-orbit is very large; the sclerotica consists of a ring of bony plates, and the nostrils are placed near the orbits. The cervical vertebrae are large and strong, and capable of great flexibility backwards and forwards, probably to allow the head to fall back to the centre of gravity during flight. The dorsal vertebrae are from 17 to 20 in number. The sacrum is formed by the coalescence of two vertebrae only, as in existing reptiles, and not of many, as in birds and certain extinct sau-

rians. The tail is generally short, an unusual character with saurians; but a species with a long tail occurs at Solenhofen. There are five toes or digits on each foot; the outer finger of the forearm is immensely elongated for the support of a membranous expansion (the impression of which is preserved in some instances); and the other digits of fore and hind feet terminated in long curved claws. The size and form of the extremities shew that the Pterodactyl was capable of perching on trees, of hanging against perpendicular surfaces, and of standing

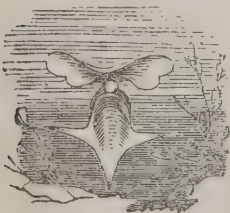

Pterodactyl.

firmly on the ground, when, with its wings folded, it might crawl on all fours, or hop like a bird.' The famous quarry of lithographic stone at Solenhofen, of Upper Oolite age, has supplied a great variety of these flying lizards; but the largest species have been found in the Secondary beds of Great Britain. In the Upper Greensand, at Cambridge, the remains of a species that must have had a spread of wing of 25 feet across, have been found; and in the Kentish Chalk, another has been met with very little short of this in its dimensions. The different species vary as much in structure as in form, so that the original genus has been lately raised to the position of an order, under the name of PTEROSAURIA, and the species have been arranged under the following genera, characterised principally by the structure of the jaw and teeth: *Pterodactylus*, in which the jaws are furnished with long slender teeth along their whole length; *Ramphorhynchus*, with the extremities of the jaws smooth, probably furnished when living with a horny bill, and towards the bases of the jaws having four or five strong teeth; and *Dimorphodon*, with large strong teeth in front, and small shorter ones behind. Nearly 50 species have altogether been described. The large series of species from the English Greensand has been studied by Seeley, who finds them to have the united metatarsal and tarsal bones, and the brain-structure of the birds. This division, called *Ornithochiroe*, is related to the *Archaeopteryx*, and belongs probably to the birds, connecting them, no doubt, with the true Pterodactyls.

PTEROMYS. See FLYING SQUIRREL.

PTEROPODA (Gr. wing-footed), a class of molluscs, having for their only organs of locomotion wing-like fins attached to the sides of the head

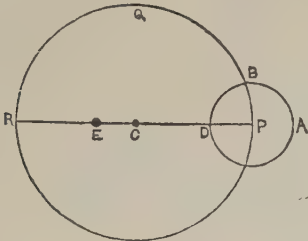

Example of the Pteropoda (*Cledora pyramidata*).

inct in some, but obscurely distinguished from the pod in others. Those which have the head most distinct, as *Clio* (q. v.), have no shell, and form

the order *Gymnosomata*; those with the head indistinct, the order *Thecosomata*, have a thin external shell, which in some is globular, with slits for the wings to pass through, in some triangular and pyramidal, in some conical, in some slipper-shaped, &c. All the species are marine; they are small and delicate creatures, very lively and active, always in quest of food, and affording food to fishes and cetaceans. They are found in all parts of the world, some of them in immense numbers in tropical, and some in arctic seas. None of them are common on the British coasts. The genera and species are few.

PTOLEMAIC SYSTEM of Astronomy, so called from Ptolemy (q. v.), its chief expounder, was originated, however, long before his time, and was, in fact, merely an attempt to reduce to a scientific form the common and primitive notions concerning the motions of the heavenly bodies. It was implicitly adopted by Plato, Aristotle, Hipparchus, and (with the exception of the Pythagoreans, and probably of Pythagoras himself) all the eminent physicists and philosophers of ancient times; passing from them to the Byzantines and Arabs, who, especially the latter, were the means of disseminating it through Western Europe, where it continued to be the universally established doctrine till the 16th century. The primary and fundamental doctrines of this system are that the earth is the centre of the universe, and that the heavenly bodies revolve round it in circles, and at a uniform rate. These notions, which are naturally suggested by the first general aspect of things, having, previous to any accurate observation, established themselves as unquestionable axioms, phenomena which were found, on closer examination, to be inconsistent with them, were explained by the introduction of additional hypotheses. The belief that the earth is the centre of the universe, was supported by its being in accordance with the relation of the primary elements of which the material world was supposed to be composed. Thus, earth, the most stable of the elements, held the lowest place, and supported water, the second in order; above water was placed air, and then fire, ether being supposed to extend indefinitely above the others. In or beyond the ether element were certain zones or heavens, each heaven containing an immense crystalline spherical shell, the smallest enclosing the earth and its superincumbent elements, and the larger spheres enclosing the smaller. To each of these spheres was attached a heavenly body, which, by the revolution of the crystalline, was made to move round the earth. The first or innermost sphere was that of the moon, and after it in order came those of Mercury, Venus, the Sun, Mars, Jupiter, Saturn, and the fixed stars, eight in all. To this system, later astronomers added a ninth sphere, the motion of which should produce the precession of the Equinoxes (q. v.), and a tenth, to cause the alternation of day and night. This tenth sphere, or *primum mobile*, was supposed to revolve from east to west in 24 hours, and to carry the others along with it in its motion; but the Ptolemaic astronomers do not venture to explain how this was done, although since the axis of motion of the *primum mobile* was that of the equator, its extremities being the poles of the heavens, while that of the ninth sphere was the axis of the ecliptic, some explanation was certainly necessary. As observations of the heavens became increased in accuracy, it was found that the heavenly motions were apparently not uniform, and this was explained as follows: The acceleration of the sun on one side, and retardation on the other side of his orbit, is only apparent, and

results from the earth not being in the centre of his sphere, C (see fig.), but at E, and consequently his motion appears to be slowest at P, and

quickest at R. The alternate progression and regression of the planets was accounted for by supposing them to move, not directly with their crystallines, but in a small circle, whose centre was a fixed point in the crystalline, and which revolved on its axis as it was carried round with the latter; thus (fig.) the planet was carried round the small circle ABD, as that circle was carried round PQR (now supposed to represent the planetary crystalline). The planet, while in the outer portion of its small circle, would thus have a forward, and in the inner portion a backward motion. The larger circle was called an *eccentric*, and the smaller an *epicycle*. This theory of eccentrics and epicycles satisfied the early astronomers; but further investigation shewed its incompleteness, and in later times it was found necessary to explain newly-discovered discrepancies by heaping epicycle upon epicycle, till such a complication of the system had been produced, as drew from Alfonso X. of Castile, to whom the P. S. was being explained, the humorous though somewhat blasphemous remark, that 'if the Deity were now to reconstruct the world, he (Alfonso) could give him a few useful hints.' As soon as astronomers came to understand and test the *Copernican Theory* (q. v.), the venerable and disorderly pile of hypotheses, the then representative of the P. S., which had received the papal seal of infallibility, and had in various forms held supreme sway over the minds of men for twenty centuries, at once crumbled to atoms, and sunk into oblivion.

PTOLEMAIS. See ACRE.

PTOLEMY I., son of Lagus, is also known by his surname **SOTER**, or the Preserver. He was believed by some to be the son of Philip of Macedon, because his mother, Arsinoë, had been a concubine of that king, his father being a Macedonian of humble station. P. acted as one of Alexander's generals in his eastern campaigns; and when the possessions of the great conqueror were divided, after his death at Babylon, 323 B. C., Egypt fell to the lot of the son of Lagus. Troubles soon followed such an acquisition; but P. was a man of energy and valour, and not only warded off danger from his own realm, but also extended his dominions by the addition of Phœnicia and Cœle-Syria, capturing Jerusalem, too (most probably in this expedition), by assaulting it on the Sabbath-day. In 316 B. C., war again broke out between P., Lysimachus, and Cassander on the one hand, and Antigonus on the other. (See these names.) It lasted till 301 B. C.; and at its conclusion P. was left in possession of almost the same territory as he ruled at its commencement, with the exception of Cyprus, which, by the naval battle off Salamis in that island (306 B. C.), was gained by Antigonus. P., however, recovered Cyprus in 295 B. C., and it was thereafter attached to the Egyptian kingdom.

After said battle of Salamis, in 306 B. C., Antigonus assumed the title of king, which example P. and the other successors of Alexander followed. In 305 B. C., P. compelled Demetrius, the valiant son of Antigonus, to raise the siege of Rhodes, for which deliverance the Rhodians were so grateful that they worshipped him as a deity, and conferred on him the title of *Soter*, or Preserver. The latter part of his reign was peace. He governed his kingdom with an enlightened and vigorous policy, and so laid the foundation of that prosperity which Egypt enjoyed for many succeeding generations. He encouraged commerce, and soon made Alexandria the great mart of the Mediterranean. He fostered literature, science, and art; and not only founded the famous Museum and Library of Alexandria, but also entertained at his court the votaries of the Muses; Euclid, the geometrician; Stilpo, the philosopher; Philetas, the elegiac poet; Zenodotus, the grammarian; Antiphrilos and Apelles, the painters; with many others. The history of Alexander's wars, by P., is the basis of Arrian's work on the same subject. Two years before his death, which occurred in 283 B. C., he abdicated in favour of his son, Ptolemy Philadelphus. His reign extended from 323 to 285 B. C.

PTOLEMY II., surnamed **PHILADELPHUS**, was the son of Ptolemy I. and Berenice. He was born, 309 B. C., in the island of Cos. His reign is remarkable rather for the successful cultivation of the arts of peace than of the practice of war. Excepting a contest with his half-brother, Magas, for the province of Cyrene, his wars against Syria are almost the only military exploits which interfered with the prosecution of those designs for the improvement of his kingdom, which have rendered his name famous among wise and enlightened sovereigns. He carried on, with even increased zeal, the good work which his father had begun. He enriched the library of Alexandria with all the literary treasures of his own and of earlier times, and the museum was crowded with the learned from all countries—with such men as Theocritus and Philetas, the poets; Euclid, the geometrician; Aristarchus and Aratus, the astronomers; Theodorus and Hegesias, the philosophers; and many more. Tradition alleges that it was by his orders the Hebrew Scriptures were translated into Greek, and the version called the 'Septuagint' (q. v.) thus formed. He induced Manetho to write, in Greek, a political history of Egypt, and an account of the religious tenets of the Egyptians. He encouraged the study of natural history; and to facilitate the pursuits of those who devoted themselves to it, he formed a collection of rare and curious animals in the preserves, which we may call the 'Royal Zoological Gardens' of Egypt. He founded many colonies in those parts of his empire which seemed specially suited to become centres of trade and of enlightenment, and thus spread more widely the seeds of civilisation and Greek culture; among these was Ptolemais (Acre), in Palestine. He ruled over Egypt, Phœnicia, and Cœle-Syria, Lycia, Caria, Cyprus, and the Cyclades, with parts of Arabia, Libya, and Ethiopia. His son Ptolemy married Berenice, the daughter of Magas, and the province of Cyrene was thus peacefully brought back to his empire. Under P. Philadelphus, Egypt rose to a high rank among the nations in power and in wealth. The surname of Philadelphus was assumed by P. to indicate his great affection for his sister Arsinoë, whom he married after the death of her husband, Lysimachus. His former wife, Arsinoë, daughter of Lysimachus, was banished by him; and two of his brothers were put to death. It is with reference to this last circumstance that

ne have explained the name Philadelphus, as in irony. By his first wife, he had two sons, Ptolemy, his successor, and Lysimachus; and one daughter, Berenice, married to Antiochus II., king of Syria. He reigned from 285 to 247 B.C.

PTOLEMY III., surnamed **EUERGETES**, succeeded his father Philadelphus, and reigned from 247 to 222 B.C. He made war on the kingdom of Syria, to avenge the death of his sister Berenice, who had been murdered at the instigation of Laodice, former wife of Antiochus. He overran all the provinces as far south as Babylon and Susa; those on the north and east as far as Bactria and India, offered him homage; and he might have extended the bounds of his empire much further, had not domestic troubles compelled him to hasten back to Egypt. The treasures he brought with him were immense; and among the things most highly prized were the statues of the Egyptian gods which Cambyses had carried off to Babylon in 525 B.C. It was the restoration of these to their proper temples which gained for P. the title of Euergetes (the Benefactor). His fleets gained many possessions on the coast of the Mediterranean, such as Pamphylia, Cilicia, and Ionia, which remained for a long time subject to Egypt, though the eastern provinces recently conquered soon returned to their former sovereign. He pushed the limits of the home-empire further south, by conquering part of Ethiopia, where he formed a colony and centre of trade at Adule. P., like his predecessors, patronised learned men, and encouraged the study of the arts and sciences. He added so largely to the library of Alexandria that he has by some been called its founder. Among the celebrated men who adorned his court, and kept up the fame of the 'Museum,' were Apollonius Rhodius, Eratosthenes, and Aristophanes, the grammarian. In his reign, the Egyptian kingdom reached the highest point of military glory, prosperity, and wealth.

PTOLEMY IV., surnamed **PHILOPATOR**, reigned from 222 to 205 B.C. He was the unworthy son of the preceding king. His reign began in blood by the murder of his mother Berenice, his brother Magas, and his uncle Lysimachus; and it ended in blood by the violent death of his wife Arsinoë. He abandoned himself to debauchery, and intrusted the management of his kingdom to favourites. Antiochus, king of Syria, profiting by his indolence, wrested from him in war some of the provinces which his father had gained; but P., at length roused from his lethargy, took the field in person, and defeated Antiochus at the battle of Raphia. When peace was concluded, P. returned to his capital, and plunged with increased zest into every vice and indulgence. He died in 205 B.C.; his death being hastened by his excesses. He followed the example of his father and grandfather in patronising arts and letters, and cultivated friendship with the Romans, to whom he sent large supplies of grain during the second Punic War, but persecuted the Jews, against whom he had conceived a hatred in consequence of being refused admittance to the sanctuary at Jerusalem by the high priest.

PTOLEMY V., **EPIPHANES**, succeeded to the throne of his father Philopator, when only five years of age, and reigned from 205 to 181 B.C. His dominions were invaded by Antiochus, king of Syria, and Philip, king of Macedonia, while he was still an infant, and several provinces were severed from the Egyptian kingdom; but the Romans at length interferred, and peace was concluded, it being arranged that P. should marry Cleopatra, daughter of Antiochus, and receive as her dowry those parts

of his empire in Syria which had been taken from him. He was declared of age in 196 B.C., and his coronation was performed with unusual splendour. The decree published on this occasion is that which forms the inscription on the far-famed Rosetta Stone (q. v.). P. married Cleopatra in 193 B.C. The affairs of the kingdom were managed by the wise and virtuous Aristomenes, and so long as P. followed his counsels, all went well. But the king's ear was gradually opened to insinuations against his great minister, whom he ultimately compelled to drink poison. While P. was preparing for an expedition against Syria, he was poisoned by some of his followers, whom he had alarmed for their own safety. Under him, Egypt rapidly sank in prosperity, power, and reputation.

PTOLEMY VI., **PHILOMETOR**, reigned from 181 to 146 B.C. He was very young at his father's death, and the affairs of the kingdom were therefore directed by his mother Cleopatra, who acted with remarkable prudence and energy. When she died in 173 B.C., the administration fell into the hands of two worthless ministers, Euleus and Lenæus, who, engaging in war with Antiochus, brought the kingdom to the brink of ruin. The young king was taken prisoner by Antiochus (170 B.C.), who hoped to obtain possession of the whole of Egypt; but his younger brother, also called Ptolemy, immediately declared himself sovereign under the title of Euergetes II., and took vigorous measures to defend the kingdom. By the intervention of the Romans, Antiochus was compelled to return to his kingdom. The brothers reigned jointly for some time, but at length quarrelled, and a civil war ensued in which Euergetes II. was ultimately worsted. The deputies of the Roman Senate, who now did as they pleased in Egypt, arranged that P. Philometor should retain Egypt proper, while Euergetes II. should obtain Cyrene as a separate sovereignty. This settlement substantially held during the lifetime of the former, P. reigned 35 years, and died in 146 B.C., from injuries received by a fall from his horse in a battle against the Syrian usurper Alexander Balas. He is celebrated for his mild and humane disposition, which was strikingly evinced in his magnanimous treatment of his unworthy brother.

PTOLEMY VII., or **EUERGETES II.**, best known by the nickname **PHYSCON**, or *Big-belly*, ascended the throne after the death of his brother. He married his brother's sister and widow, Cleopatra (who was also his own sister), and on the same day murdered her infant son P. Eupator, whom she had at first declared king. The history of his reign is one unbroken record of murder and blood, whence his subjects nicknamed him *Kakergetes* ('the malefactor'). Not only relatives who stood in his way to the throne, but those who opposed his accession, and even innocent persons, were butchered with savage cruelty. His private vices and debaucheries were equally infamous. He divorced his wife and sister Cleopatra to marry her daughter by her first husband—his own brother; and when temporarily driven from his throne, 130—127 B.C., by the indignation of his subjects, who chose the divorced Cleopatra in his room, the monster took a diabolical revenge by murdering his own and Cleopatra's son, and sending the head and hands as a present to the latter on her birthday. One is almost ashamed to add that he retained the hereditary taste for learning, and patronised learned men. He himself wrote a work of 24 books, called *Memoirs* (*Hypomnemata*). He reigned from 146 to 117 B.C.

Besides these, there are several Ptolemies of less

note—as, for example, PTOLEMY VIII., or SOTER II., otherwise called LATHYRUS or LATHURUS, who reigned first from 117 to 107 B.C., and again from 80 to 81 B.C.; also PTOLEMY IX., or ALEXANDER I., youngest son of Ptolemy VII., who reigned from 107 to 90 B.C.; PTOLEMY X., or ALEXANDER II., son of Alexander I., 81—80 B.C.; PTOLEMY XI., or DIONYSUS, or AULETES, an illegitimate son of Ptolemy Lathyrus, who reigned from 80 to 51 B.C.; PTOLEMY XII., who reigned for some time in conjunction with his sister Cleopatra, and who was ultimately drowned in the Nile, after being defeated by Cæsar; and lastly, PTOLEMY XIII., younger brother of the preceding. Cæsar appointed him joint ruler with Cleopatra, his sister and intended wife. He died by violence in 43 B.C., at the instigation of Cleopatra.

PTOLEMY, a celebrated astronomer and geographer, whose proper name is CLAUDIUS PTOLEMÆUS, was a native of Egypt, though it is uncertain whether he was born at Pelusium or Ptolemais in the Thebaid. Nothing is known of his personal history, except that he flourished in Alexandria in 139 A.D., and there is probable evidence of his having been alive in 161 A.D. The chief of his writings are: *Megalē Syntaxis tēs Astronomias*, which, to distinguish it from the next-mentioned, was probably denominated by the Arabs *megistē*, the greatest, whence was derived the name *Almagest* (Arab. article *al*, the), by which it is generally known; *Tetrabiblos Syntaxis*, with which is combined another work, called *Karpos* or *Centiloquium*, from its containing a hundred aphorisms, both works treating of astrological subjects, and held by some on this account to be of doubtful genuineness; *Phasers aplanōn asterōn kai synagōgē episēmaseiōn*, a treatise on the phenomena of the fixed stars, or a species of almanac; the *Geographikē Hyphēgēsis*, his great geographical work, in eight books. The rest of his works are of inferior importance, and consist of descriptions of various kinds of Projections (q. v.), the theory of the musical scale, chronological and metaphysical treatises, and a summary of the hypotheses employed in his great work, the *Almagest*. Others of P.'s works have been lost, and it is still a moot-point whether or not they contained a treatise on Optics, as a Latin version of what is said to have been an Arabic translation of P.'s original treatise on that subject is still in existence.

P., both as an astronomer and geographer, held supreme sway over the minds of almost all the scientific men from his own time down till about the 15th c.; but, and in astronomy specially, he seems to have been not so much an independent investigator as a corrector and improver of the work of his predecessors. In astronomy, he had the labours of Hipparchus to guide him; and, indeed, scrupulously distinguishes between Hipparchus's labours and his own. To P. belongs the invention of a planetary theory, the discovery of the moon's Evection (q. v.), and the singular distinction of being the sole existing authority on the subject of ancient astronomy. From this last-mentioned fact, the system of astronomy which he sets forth in the *Almagest* received his name; and, as the *Ptolemaic System* (q. v.), obtained the homage of succeeding generations till the time of Copernicus. His great work, the *Almagest*, is divided into 13 books. P. seems to have been little of an independent observer, trusting implicitly to his predecessor, Hipparchus; out his geometrical powers were of a very high order, unless, as Delambre suggests, but with little probability, the elegant demonstrations here and there occurring in the *Almagest* were borrowed from other sources.

As a geographer, P. occupies a similar position to what he holds in astronomy; he appears before his readers as the corrector and improver of the works of a predecessor, Marinus of Tyre, about whom, except from P.'s writings, little is known. P. here appears to more advantage as an independent investigator, and his improvements and suggestions are at once more valuable and correct; but it is sometimes difficult to separate his data from those of Marinus. His geography is divided into eight books, all of which, with the exception of the first, eighth, and a portion of the seventh, are nothing more than a catalogue of places, with their latitude and longitude (to 12ths of a degree), with a brief general description prefixed to each continent and country or tribe, and interspersed here and there with remarks of a miscellaneous character on any point of interest. The rest of the work contains details regarding his mode of noting the positions of places—by latitude (*mēkos*) and longitude (*platos*)—with the calculation of the size of the sphere of the earth, and of the extent of surface then known. He also describes the mode adopted by him of projecting the surface of a hemisphere on a flat surface, and shews its superiority over the projections of Eratosthenes, Hipparchus, and Marinus. He also constructed a series of twenty-six maps, together with a general map of the world, in illustration of his work.

The *Almagest* and the *Geography* were the standard text-books to succeeding ages, the first till the time of Copernicus, the second till the great maritime discoveries of the 15th c. shewed its deficiencies. They have passed through numerous editions, the best of which are, for the *Almagest* and the most of P.'s minor works, that by Halma (Paris, 1813—16—19—20, quarto); and for the *Geography*, the Latin versions of 1482 and 1490, published at Rome, the *editio princeps* of the Greek text by Erasmus (Basel, 1533, 4to), and the Elzevir edition (Lugd. Bat. 1619, fol.). The catalogue of stars has been frequently reprinted separately, the last and best edition being that of Francis Baily, in vol. xiii. of the *Memoirs of the Royal Astronomical Society* (London, 1843).

PTO'SIS (from the Gr. *ptipō*, I fall) signifies a drooping or falling of the upper eyelid, and arises from palsy of the third or *motor oculi* nerve. It may arise either from debility, in which case it may be removed by tonics; or from congestion of the brain, when it is usually accompanied with giddiness, headache, &c., and should be treated by bleeding, purgatives, and low diet; or from organic disease of the brain, in which case remedies are of little use. If it occurs without any apparent cause, and resists medical treatment, it may be removed by a surgical operation, by which the eyelid is brought under the action of the occipito-frontal muscle, which receives its nervous power from another source.

PTYCHODUS, a genus of cretaceous fish, founded on large square crushing teeth, which occur in considerable quantity in the Cretaceous beds. The crowns of the teeth are raised in the centre into a number of parallel transverse ridges, and the flat margins are finely granulated. They were set, as in the Port Jackson shark, like a pavement on the borders of the mouth, and were admirably adapted to crush the shells of the crustacea and mollusca on which the animal fed. Large dorsal spines have been found associated with the teeth. It has been assumed that the P. are analogous to the Ptychodus, but Professor Cope has recently shown that they belong to the soft-rayed bony fishes of the extinct family, *Sarcopterygidae*.

PUBLICANI (from Lat. *publicum*, that which is public or belongs to the state), the name given by the Romans to those persons who farmed the public revenues (*vectigalia*). These revenues were put up to auction by the censors, and were 'sold' for a period of five years. They were derived chiefly from tolls, tithes, harbour-duties, *scriptura* (the tax paid for the use of public pasture-lands), mining and salt duties. As the state required the publicani to give security for the sum at which they had purchased the collecting of the taxes, and as this sum was usually much greater than the wealth of any single individual, companies (*societates*) were formed, the members of which took each so many shares and were thus enabled to carry on conjointly undertakings far beyond the capabilities of the separate shareholders. Their contract with the Roman government was made in the name of a single person, who was called *maniceps*, and who was held responsible for his *socii* to the state. Every *societas* had also a head-manager (*magister*), who resided at Rome, and transacted all foreign correspondence with the inferior officers who directly superintended the collection of the taxes. In general, a *societas* farmed only one branch of the revenue, but exceptions occur. Only Roman citizens were eligible as publicani, and, as a matter of course, only the wealthiest among these could become such. After the middle of the 2d c. B.C., the farming of the public revenues fell into the hands chiefly of the Equites (q. v.). By a wise regulation, no governor of a Roman province was allowed, during the period of his governorship, to have anything to do with these tax-gathering companies. The design of this was to place the governor in such a position that he could afford to act justly towards the people, who were often cruelly oppressed by the exactions of the provincial underlings—the 'publicans' of the New Testament.

PUBLIC BURDENS is a phrase in Scotch law to denote the usual taxes or charges on land, in respect both of its ownership and possession. Such are the land-tax, minister's stipend, manse assessments, schoolmaster's salary, poor-rates, rogue-money, road and bridge assessments. Public burdens, where no stipulation is made to the contrary, fall upon the landlord, and not on the tenant, except in the case of schoolmaster's salary, which is equally divided between landlord and tenant.

PUBLIC HEALTH ACT is an important act in England regulating sanitary matters (11 and 12 Vict. c. 63). It enabled local boards of health to be created all over England. The initiative was given to one-tenth of the rated inhabitants of cities, boroughs, parishes, and places having a defined boundary, to take proceedings to have the act applied to their district, whereupon and so to deal systematically with sewerage, drainage, water-supply, paving, lighting, watching. The General Board of Health first send an inspector to report, and afterwards direct the act to apply. The act has been further supplemented by a family of kindred acts called the Local Government Acts, the Nuisances Removal Acts, and the Prevention of Diseases Acts. The state of the law produced by these combined statutes is very complicated, but the result is greatly to extend sanitary improvements.

PUBLIC-HOUSES in England are known under two classes, viz., Ale-houses, also called Inns (q. v.), and Beer-houses. The former give board and lodging to travellers, while the latter are mere shops for the sale of beer to be consumed on the premises.—1. An ale-house must be first licensed by the justices, before the keeper of it can sell excisable liquors to be consumed on the premises. The granting of the

licence may be opposed by any inhabitant. The justices' licence is not enough to enable the publican to sell liquors, but it is absolutely essential; and an excise licence must follow, and not precede the justices' licence. The licence is in force for one year; and if any offence or misconduct is committed, the renewal of the licence may be opposed, and refused on the next meeting. The licence compels the keeper to keep unadulterated liquor, to use only legal measures, not to permit drunkenness or unlawful games, or bad characters, to keep good order, and lastly, not to open his house, except to travellers, on Sundays during the morning and afternoon divine service. The law as to the opening of public-houses during Sunday has been altered considerably of late years; but the present state of the law is as follows: no public-house can be opened for the sale of fermented or distilled liquors before half-past 12 at noon on Sunday, or, if the morning divine service is not then terminated, before such termination. It must be again shut between 3 and 5 P.M., and shut altogether at 11 P.M., until 4 A.M. of the following morning. Christmas-day and Good Friday, and public fast or thanksgiving days, are treated as Sundays. The same law applies to beer-houses and all places of public resort where fermented and distilled liquors are sold. Travellers are expressly excepted from the above rule, and the decisions of courts of law have settled the point that a traveller is a person who walks or drives a few miles out of town, whether for pleasure or on business. As regards public-houses, constables have the power of entering them at all times, and it is an offence in the publican to refuse them admission.—2. Beer-houses are subject to the same rules as ale-houses on Sundays. They do not require, however, to be licensed by justices. Any person who can produce a certificate of the overseers that he is the occupier and tenant of a house paying above £8 in the country, or £11 in large towns, and £15 in London of rent, can demand a licence from the excise, which is renewable each 10th of October. A board must be put over the door, and state that it is a licensed beer-house. The keeper of a beer-house can only sell beer, porter, ale, cider, or perry, but not wine or spirits, though he may, if he choose, obtain a separate wine licence. In London, he must close his shop between midnight and 5 A.M. of the next morning; and in towns of at least 2500 inhabitants, at 11 P.M., and elsewhere at 10 P.M. on weekdays. Constables have free access to beer-houses as well as ale-houses. Though beer-houses are thus restricted as to the hour of closing at night, there is no restriction on ale-houses, except on the Sunday night, and therefore ale-house keepers may keep open their houses all the night long on other days of the week, if they think fit. But there was a restriction imposed in 1864 by 27 and 28 Vict. c. 64, whereby all public-houses and refreshment-houses in the metropolitan police-district must be closed between 1 and 4 A.M. Publicans are, as already stated, prohibited from allowing games in their houses; and it has been held that a publican cannot even allow his friends in his own back-parlour, though it is separated from the rest of the house, to practise this gaming, provided it is a game for money. There was a restriction imposed by the Tippling Act, 24 Geo. II. c. 40, on the keepers of ale-houses as regards debts for spirits under 20s., by which they could not recover payment of these small scores; but that enactment was repealed, except only as regards spirits sold to be consumed elsewhere than on the premises, and delivered to the purchaser in less quantities at one time than a quart. So that publicans are still prohibited, by 25 and 26 Vict. c. 38, from suing for debts due for small

quantities of spirits sent out of the house to purchasers.

In Scotland, the law affecting public-houses has been considerably altered of late years, and the governing statute is now 25 and 26 Vict. c. 35. Certificates for the sale of excisable liquors must be applied for to the justices of the peace, who meet for the purpose in April and October. The justices have a discretion in particular localities as to fixing the hours of closing within certain limits. Certificates to sell wines and spirits include power to sell beer and cider also; but they may be granted for the sale of wine, porter, ale, beer, cider, and perry only; or for beer, porter, ale, cider, and perry only; so that there are three kinds of certificates, corresponding to what exists in England. The justices' certificate also must be obtained for the spirit and wine licence, before application for the excise licence. The justices have power, in special circumstances, to regulate the hours of closing; but the general hours of closing in all cases are as follows: the houses shall not be open for sale or drinking before 8 A.M., nor after 11 P.M., with the exception of refreshment to travellers, or to persons lodging in the premises: and the house shall not be opened for the sale of any excisable liquors, or drinking thereof, on Sunday, except for the accommodation of lodgers and travellers. Though, however, on Sundays, travellers and lodgers only are to be supplied with drink, this is only so in the case of inns and hotels; for with regard to public-houses proper, and spirit or beer-shops, these are not allowed to be open on Sundays even to travellers or lodgers. The certificate of justices is granted on the same conditions as to good order as in England. The owner of any property in the neighbourhood may object to the granting or renewing of the certificate. Constables may enter at any time eating-houses, if they suspect excisable liquors are unlawfully sold there. The chief officer of police is to report to the procurator-fiscal the places where intoxicated persons are seen frequently to issue. Persons keeping shebeens, or uncertificated places where spirits or excisable liquors are sold or drunk, are punished heavily, and also the persons found drunk there may be fined 10s. The main difference between English and Scotch inns and public-houses is the shutting up these for the whole Sunday in Scotland. In both countries, travellers are excepted; though the same definition will and ought to be given to that word in both countries, still there is a penalty imposed in Scotland of £5 on any person who falsely represents himself to be a traveller, so as to procure entertainment and drink in an inn; whereas no such penalty is imposed in England, the only person who runs the risk there is the innkeeper himself, and he, of course, cannot be convicted unless it is shewn he actually knew that the party representing himself to be a traveller was not so. The policy of these restrictions on the closing of inns and public-houses on Sunday has been much discussed of late years.

PUBLIC PROSECUTOR. See PROSECUTOR.

PUBLIC SCHOOLS. See SCHOOLS.

PUD, or **POOD**, a Russian weight which contains 40 Russian pounds—almost equivalent to 36 English pounds avoirdupois.

PUDDING, although a word in such common use, and so generally understood, is very difficult to define, for there are few preparations of cookery so varied. It may be considered one of the national dishes of Great Britain; in no other country is it used so extensively by all classes of the people. The plum-pudding is the glory of an English table, and is regarded as an essential on all festive occasions. Puddings are either made

of dough simply boiled in a cloth or basin, and with or without other materials; or they may be made of a batter of flour, or other farinaceous material, and water, and poured into the pudding-cloth and boiled; or into a dish and baked. It is common also to make fruit and meat puddings, by rolling out dough or paste into large flat sheets, and enclosing the fruit or meat entirely in them, and then tying them up in the pudding-cloth and boiling them. These are the general characters of this dish, but the recipes for varying the details are innumerable.

PUDDING-STONE, a rock composed of water-worn pebbles, cemented together by a firm paste. It is now more generally known as Conglomerate (q. v.).

PUDDLING, a process by which wells, ponds, canals, &c., are lined with clay or loam impervious to water. See EMBANKMENT.

PUEBLA, or **PUEBLA DE LOS ANGELES**, a city of Mexico, capital of a state of the same name, stands on a fruitful plain, 7381 feet above sea-level, and 76 miles east-south-east of the city of Mexico. In the vicinity are Orizaba, Popocatepetl, and other lofty mountains. It was founded in 1531, and, after the capital, it is not only the most populous, but also the most industrious city in the empire. Its streets are regular, broad, and well paved. The houses, which are frequently three stories in height, are flat-roofed, covered with variously-coloured tiles, and profusely ornamented, both inside and out, with fantastic paintings resembling frescoes. There are 44 fountains, and the water is supplied by means of an aqueduct. It contains 69 churches, 9 monasteries, 13 convents, and 23 theological colleges. On the great square stands the cathedral, an imposing building, the interior of which is decorated in the most sumptuous manner with ornaments of gold and silver, paintings, statues, &c. Among the numerous educational institutions, there are several of the highest class. There are also hospitals, the government and the bishop's palaces, charity schools, and other benevolent institutions. The more wealthy inhabitants are accomplished, refined, and benevolent; but the lower classes are esteemed the most demoralised in the empire. Glass, earthenware, soap, woollen fabrics, and sword-blades are manufactured. Pop. about 75,000. After a siege of three months, the Mexican troops surrendered to the French, May 1863. See MEXICO in SUPP., Vol. X.

PUERPERAL FEVER is the most fatal disease to which women in childbed are liable. It has been described under various other names than that which is now assigned to it—as *Childbed Fever*, *Peritoneal Fever*, &c. A careful investigation of the records of more than two centuries shews that the disease prevails epidemically, and that it is more virulent in lying-in hospitals than in private practice. The essential nature of the disease is a subject that has led to the expression of many different opinions. The views that it is (1) *inflammation of the uterus*, (2) *inflammation of the omentum and intestines*, (3) *peritonitis, either alone or connected with erysipelas*, (4) *fever of a special nature*, (5) *disease of a putrid character*, or (6) *a disease of a complicated nature*, have all been advocated by physicians of high reputation; and Professor Scanzoni, one of the highest German authorities in the department of midwifery, maintains that the disease originates in an altered condition of the blood, and consists mainly in the presence of pus in that fluid. This variety of views is doubtless, in a great measure, due to the varied characteristics of different epidemics. When a disease is epidemic, it is always difficult to ascertain whether it is contagious; but in the case of

puerperal fever, there is an overwhelming amount of evidence, not only that the virus can be carried by the practitioner from one parturient woman to another, but from various other morbid sources; the peculiar condition of childbirth, and possibly certain atmospheric conditions, rendering the mother peculiarly susceptible of such contagion. Numerous series of fatal cases have been traced back to the medical man or nurse having immediately before been in attendance on a case of erysipelas, of sloughing sores, of gangrene, or of typhus fever. It is the opinion of Rokitsansky and others that the morbid matter acquired by the dissection of subjects not dying from this disease, may excite the disease in a patient shortly afterwards delivered by the dissector; and there is no doubt that any one who assists at the *post-mortem* examination of a puerperal patient, becomes, as it were, a focus of intense contagion. Considering the extreme severity and undoubted contagious nature of this disease, the practitioners and nurses who come in contact with it should wash their hands either with a weak solution of chlorine (which has been found of great service in destroying the contagion in the great lying-in hospital at Vienna), or in a solution of chloride of lime, as well as with soap and water. Moreover, persons much engaged in midwifery would do well not to take any part in *post-mortem* examinations, especially when the death resulted from this disease; and when of necessity they are present, they should wear a special dress for the occasion, and take every precaution as to ablution.

Puerperal fever occurs in such varied forms that numerous divisions or species of it have been suggested. The late Dr Gooch, one of the highest authorities on this subject, divided puerperal fever into (1) the *inflammatory* and (2) the *typhoid*; while Dr Robert Lee and Dr Ferguson (two of the highest living authorities) make four divisions.

Inflammatory puerperal fever is most commonly due to peritonitis, but may depend upon inflammation of the uterus, the ovaries and uterine appendages, the uterine veins, &c. The ordinary symptoms, in the most common form (namely, when there is peritonitis), are rigors, followed by heat of skin, thirst, flushed face, quickened pulse, and hurried respiration. The abnormal heat of the skin soon subsides, and is followed by nausea, vomiting, pain in the region of the womb, commencing at one spot, and extending over the abdomen. This pain increases as the inflammation extends, till the patient presents the symptoms described in the article PERITONITIS. The pulse is uniformly high; the tongue coated; the urinary secretion diminished, and often passed with difficulty; while the intellectual faculties are rarely affected. Five or six days are the average duration of this disease, which may prove fatal on the first day, or may extend to ten or eleven days. In some epidemics (as, for example, in Paris, in 1746; in Edinburgh, in 1773; and in Vienna, in 1795), none recovered. Dr Ferguson states, that 'to save two out of three may be termed good practice in an epidemic season.' The treatment so closely resembles that which is required in ordinary acute Peritonitis (q. v.), that

it is unnecessary to enter into any details regarding it.

Typhoid or malignant puerperal fever may commence in various ways, but is always accompanied with fever of a low typhoid character, and with the symptoms which usually are associated with such fever. Treatment is of little or no avail, and the patient usually sinks at the end of a few days, or even hours.

PUERPERAL MANIA comprehends many forms and degrees of mental derangement. In the experience of Esquirol, these forms presented the following proportions: of 92 cases, 49 exhibited symptoms of mania; 35, those of monomania; and 8, those of dementia. The points of agreement between these widely-differing moral phenomena are, that they occur during some stage of child-bearing, and that they can be traced to physical, but not necessarily common physical causes. Insanity is developed either during pregnancy, shortly after parturition, or during nursing. Under whatever circumstances the malady may arise, it is one of exhaustion, debility, and prostration; and this is nearly equally true, whether it be characterised by depression, languor, and passiveness, or by extreme excitement and violence. The latter are the features by which it is generally recognised, and which have justified the name by which it is generally known. The similarity to ordinary frenzy is great: there is the same watchfulness, fury, incoherence, the same vitiation of the secretions, and emaciation; and the chief differences between these affections consist in puerperal insanity being invariably traceable to disturbance of the circulation, or to animal poisoning, and in the short duration of the great majority of cases. The prognosis is, in fact, so favourable, recourse to seclusion in an asylum so painful, that it has been proposed to treat all such cases at home, or that a distinct hospital or sanatorium should be established exclusively for them. When it is stated that a physical cause may be detected in the puerperal condition, this must not be construed as excluding the psychical elements which enter into the production of all such affections. Thus, it was found by Macdonald, that of 66 cases, only 6 could be attributed to a purely physical origin; and that in the majority, fright, or anxiety, or anger had formed the last or principal of that series of conditions which culminated in alienation. It not merely affects feeble and hysterical females more than others, but in a marked manner those belonging to tainted families. Of 66 patients in the Bloomingdale Asylum, 17 laboured under a hereditary tendency to mental disease. As connected with this point, it may be mentioned that unmarried are more liable to the disease than married women, in the proportion of 11 to 2. This great disparity may partly be explained by the fact, that the fallen and unfortunate are, more than any other class of females, compelled to seek shelter in those institutions from which such statistics are obtained.—Reed on *Symptoms, Causes, and Treatment of Puerperal Insanity*; Marcé, *Folie des Femmes Enceintes, des Nouvelles Accouchées et des Nourrices*.
